

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

Nos. 1 TO 26

## Index to Volume XXXIX

### ASSOCIATIONS

A. A. A. Sanctions Chicago Speedway.....	164
Air Service Clubs Assn. Formed.....	655
American Manufacturers Export Assn.....	768
American Road Builders Assn. Convention.....	853
American Tire Filler Industry Formed.....	655
American Tractor Assn. Meeting.....	895
American Tractor Assn. Membership List.....	895
Automotive Electric to Meet.....	34
Automotive Equipment Assn. New Name of N. A. A. A. J.....	1070
Automotive Wheel Manufacturers Assn. Formed.....	382
Automotive Wheel Mfr. Assn. Elects R. H. West.....	607
Automotive Wheel Assn. Convenes.....	697
Exiles, The, Headed by Geo. M. Graham.....	694
Federal Highways Commission Proposed.....	1018
Ford Tractor Assn. Formed.....	167
Fordson Distributors Assn. of America.....	775
Foreign Trade Convention Meets.....	332
Gear Manufacturers Assn. Meets.....	527
Highways Traffic Assn. National in Scope.....	856
Mid-West Implement Dealers' Assn. Conven- tion.....	853
Midwest Retail Implement Dealers Assn.....	816
M. A. M. A. Closes Washington Office.....	74
M. A. M. A. to Support Airplane Show.....	163
M. A. M. A. Washington Office to Close.....	31
M. A. M. A. Has War Adjustment Committee.....	1076
Motor Truck Association of America.....	610
Motor Truck Assn. Has Dealer Division.....	1071
Motor Truck Club Changes Name.....	610
National Advisory Committee for Aeronautics Meeting.....	688
N. A. A. A. J. Exhibit Abandoned.....	472
N. A. A. A. J. Fall Convention Abandoned.....	512
N. A. A. A. J. Directors to Meet.....	944
N. A. A. A. J. Changed to A. E. Asso.....	1070
Natl. Assn. Motor Truck Sales Mgrs. Meets.....	738
National Assn. Purchasing Agents Will Con- vene.....	434
N. A. C. C. Endorses N. A. D. A. Work.....	76
N. A. C. C. Working for Rural Express.....	125
N. A. D. A. Discusses Car Curtailment with War Industries Board.....	295
N. A. D. A. Getting Many New Members.....	34
N. A. D. A. Work Endorsed by N. A. C. C.....	76
National Assn. of Purchasing Agents, Milwau- kee Branch.....	337
National Assn. Purchasing Agents Meet.....	532
National Assn. Purchasing Agents Elects Ranken.....	607
N. A. P. A. Branch in Kansas City.....	1067
Natl. Federation of Implement Dealers' Meet- ing.....	684
National Implement & Vehicle Assn. Meets.....	735
National Safety Council Meets at St. Louis.....	515
National Safety Council Holds Congress.....	521
Ohio Automobile Accessory Jobbers Assn.....	—
Portland Cement Assn.'s Dinner.....	939

### SOCIETY OF AUTOMOTIVE ENGINEERS

S. A. E. Air Cleaner Discussion at Twin City	652
S. A. E. Meeting January 12-14.....	891
S. A. E. Section Formed in Washington.....	848
Fall Meeting of Detroit Section.....	975
Minneapolis Section Discusses Tractor Hitch- ing.....	1024

State Highways Official Assn.....	1018
Visits Standard Aircraft Plant.....	1066
Washington Section Criticizes Army Truck Methods.....	1018

### BOOK REVIEWS

Automobile After the War.....	1057
Automotive Magneto Ignition, M. E. Toepel.....	371
Ball Bearing Manual.....	54
Cleveland Worm & Gear Co.'s Worm Gear Drive Catalog.....	797
Electrical Equipment of the Motor Car.....	837
Gasoline Automobile, Vol. III.....	1003

### CONDITIONS

Aircraft Spruce Industry, Development of the.....	1038
Airplane Fabric, History of Cotton.....	1013
Australian Gas Engine Market.....	421
Automobile After the War.....	1057
Castor Bean Industry Revived.....	211
Conditions Entirely Unsettled.....	164
Conservation Investigation of Wisconsin Deal- ers.....	296
Conversion Cooperation Assured.....	863
Corporations Cannot Develop Business.....	901
Cotton Fabric Sufficient for Airplanes.....	344
Cotton Fabric, History of Airplane.....	1013
Employment Program.....	643
Employment Schools by Government.....	382
Employment Service Bureau for Women, Gov- ernment.....	484
Employment for All After War.....	856
Engine Market in Australia, Gas.....	421
Export Trade and Labor Problem After War.....	234
History of Aircraft Production.....	968
Implement Dealers Losing Tractor Sales.....	684
Iowa Tractor Developments.....	663
Labor Allotment, Unskilled.....	252
Labor in Michigan Short 11,000 Men.....	437
Labor Conditions Investigated.....	939
Labor Leaving Passenger Car Factories.....	513
Labor Problem and Export Trade After War.....	234
Labor Shortage Continues.....	119
Labor Shortage Closes War Plants.....	384
Labor Situation Improves, Skilled.....	336
Michigan Labor Shortage Still Critical.....	687
Pontiac Centralizes Labor Employment.....	53
Price Cut Not Likely.....	939
Spruce Industry, Development of the.....	1038
Steel Controlled by Government in Canada.....	433
Time Required for Plants to Come Back.....	848
Tractor Activities in Illinois.....	869
Tractor Activities in Northern Ohio.....	619
Tractor Activities in Twin Cities.....	702
Truck Sales Good on Seaboards.....	123
Wages Increase in Automobile Industry.....	117
Wages Increase; Workers Decrease.....	897
Wages to Be Based on Work, Not Sex.....	893
Working Conditions Service Established.....	814
War Work Gradually Dropped by Makers.....	1065

### CONTESTS

De Palma Wins Five Races at Sheephead Bay	337
De Palma Wins at Chicago Speedway.....	207
500-Mile Race May 30.....	1021

### DESCRIPTIONS

#### Accessories

Aircraft Speed Meter.....	19
Allen Self-Locking Differential.....	1099
Axle for Four-Wheel Steer Trailer.....	196
Bennett Air Washer.....	448
Carbo Steel Deck for Loading.....	783
Cleveland National Spring Head Tool holder.....	431
Clutch, Golden, Belknap & Swartz.....	96
Clutch and Clutch Pulley.....	760
Cost Keeping System.....	56
Dictograph, Vanity.....	27
Dixie Standard Aircraft Magnetos.....	954
Door Lock, Ottinger.....	91
Elastic Limit Recorder.....	287
Entz Transmission on Fifth Avenue Bds.....	373
Fafnir Double Row Bearing.....	421
Foot-Strite Tractor Transmission.....	795
Fortney Measuring Wires.....	1014
Fuller Tractor Transmission.....	1014
Golden, Belknap & Swartz Plate Clutch.....	96
Guide Tractor Lamp.....	—
Hoists, Electric, Types and Their Use.....	199
Horn and Lamp Combination.....	118
Lebby Searchlight.....	427
Liberty Engine Electrical System.....	1089
Lubricator, McCormick Spring.....	370
Muffler, Vacuum.....	373
Oiling Car by Single-feed System.....	719
Ottinger Anti-Rattling Door Lock.....	91
Owen Automatic Lighting Power Unit.....	806
Recorder, Elastic Limit.....	287
Redden Universal Truck Attachment.....	322
Speedometer, Stewart.....	27
Spring Wheel, New Design.....	199
Stewart Truck Speedometer.....	27
Stewart Vacuum System.....	27
Stromberg Electric Time Clock.....	56
Tester, Permanent Magneto.....	505
Track for Tractors, Improved Chain.....	280
Transmission, Nuttall Tractor.....	506
Twin Disk Clutch Co. Clutch and Clutch Pulley.....	760
Vacuum System, Stewart.....	27
Vanity Dictograph.....	27
Warmer for Aviators, Foot.....	365
Wheel, New Design of Spring.....	199
Wheels, Two New Demountable.....	461
Willard Tractor Battery.....	837
Wismack American Gage Blocks.....	965

#### Airplanes

A. E. G. Twin-Engined.....	63
Ago Austrian Flying Boat.....	66
Armstrong-Whitworth.....	66
Aviatik.....	60
Avro Training Machine.....	707
Breguet Bomber.....	61
Breguet Reconnaissance.....	61
Bristol Battleplane.....	62
Bristol Scout Model D.....	16
Bristol Two-seater.....	548
Bristol Tractor Biplane.....	62
Bristol Tractor Monoplane.....	15
Burgess U-2 Flying Boat.....	66
Caproni Biplane Equipped with Liberty Engine.....	335
Caproni Triplane with Three Engines.....	65
Caudron.....	64
De Havilland IV Biplane.....	181
De Havilland 4 Features.....	671
De Havilland Single-seater Scout.....	627
Farman F-40.....	63

F. B. A. Flying Boat.....	66	Aircraft Co-operation.....	158	Bus Transportation for Ford Employees.....	200
F E 2-B Pusher Biplane.....	62	Aircraft Experience on Car Design.....	810	Charts, Operators' Progress.....	859
Friedrichshafen Bombing Plane.....	19	Aircraft Inventor Handicaps.....	288	Confidence Between Employer and Employee, Lack of, Tipper.....	625

Highways Transport Committee Snow Removal Program.	1036
Highways Transport Committee Work Reviewed.	1020
Highways Use Advocated.	561
Hispano-Suiza Engines to Be Built by Pierce-Arrow.	299
Hispano-Suiza Contract for Franklin Mfg. Co.	558
Hodgkins, R. T., Leaves Studebaker.	298
Holmes, Milton, Forms Truck Company.	129
Holt Back on Peace Work.	1075
Hood, Wallace C., Forms Garage Company.	388
Hopkinson, Prof. Bertram, Dies.	753
Horowitz, Louis J., in Charge of Tanks.	480
Hotel Garage for New York.	78
Housing Corporation Formed.	121
Housing Provisions Determined.	41
Housing of Tractor a Big Problem.	217
Howard, K. B., Joins Stutz.	38
Howells, E. F., Joins Sanford.	170
Hughes Aircraft Report.	741
Hudson Super-Six Prices Increased.	478
Hupmobile Industrial Wagon Production Started.	246
Hupmobile Prices Increased.	478
Hupmobile Surplus \$1,176,262.50.	517
Hurd, E. W., Promoted.	127
Hyatt Opens Coast Branch.	82
Hydro Station for Morehead City.	386
Hydroplane Contract Cancelled.	945
Hyman, H. R., Promoted.	127
Illinois to Mark Its Highways.	852
Industries Curtailed, Non-War.	516
Industries, List Being Formulated, Preferred.	385
Inspectors of Airplanes to Fly.	643
International Harvester Co. Dissolved.	255
International Harvester Merger Ratified.	519
I. H. C. Suit Dismissed.	731
Inventors' Guide, Airplane.	271
Iron and Steel Limited for Tractors.	555
Iron and Steel Price Unchanged.	559
Iron Ore Imports Permitted.	850
Iron Ore Price Increase.	564
Iron Ore Import Restrictions Modified.	1033
Irwin, N. E., Capt., Head of Naval Air Service.	378
Jacoby, K. R., Promoted.	38
Janesville Machine Reorganized.	171
Janesville Mch. Co. Starts New Plant.	389
Jarosch, F. G., Leaves Bearings Co. of Amer.	522
Jim Dandy Cultivator Bought by General Motors.	603
Johnson, Glenn, Resigns from Lincoln.	31
Johnson, H. S., Resigns.	127
Johnson, R., Resigns from Lincoln.	31
Johnston, R. H., Vice-President of White.	83
Jones Car Prices Increased.	478
K. A. L. Products to Be Marketed.	41
Kellogg, T. O., Transferred.	38
Kenly to Testify in Airplane Hearing.	161
Kenly, Wm. L., Major on Army-Navy Board.	515
Kerosene Tractor Plowing Test.	221
Ketcham, H. S., Joins Cleveland Tractor.	127
Kerosene Economy Urged.	858
Kerosene Equipment Elects Officers.	31
Kerosene and Gasoline Priority.	814
Kiefer, D., Joins Navy.	38
Killen-Strait Tractor Co. in Receivership.	654
Killen-Strait to Be Auctioned.	736
Killen-Strait Mfg. Co. Sold.	1075
King M. C. Co. to Make Kitchen Trailers.	654
Kissel Prices Increased.	478
Kitchen Trailer Bids Opened.	83
Klaxon Sales Office for Detroit.	1067
Kleist, F. W., Joins Dart.	164
Knobloch, A. F., in Ordnance Dept.	697
Labor to Be Protected by Government.	257
Labor Administration Complete.	120
Labor Boards, Local.	78
Labor Competition Condemned.	120
Labor Department Reorganized.	977
Labor Program Adopted by Government.	162
Labor Recruiting Plans Complete.	120
Labor Recruiting Rules.	78
Labor Section Merged with Defense.	733
Labor Layoff Rumor Denied.	898
Lacey, V. E., Leaves Cunningham Co.	214
Lane Truck Receives Priority Rating.	647
Lapeer Tractor-Truck Plant Complete.	82
Lauson Tractors Have Starters.	1036
Lavine Gear Co. Has Milwaukee Factory.	255
Laws, Patent and Trade Mark, of Argentine.	192
Laying the Egg on the Hun.	230
Lee, General, Flies Over Washington.	122
Lee Rubber Co. Shows Substantial Earnings.	296
Lee Tire Price Increase.	31
Leicher Brothers Make Converter.	38
Lenses, Amber, in Massachusetts.	214
Liberty Aero Oil Developed.	210D
Liberty Engines, 2514, Delivered.	121
Liberty Engine Builders Form Association.	855
Liberty Eight Engines Ordered, 8000.	378
Liberty Engines Made by Overland.	389
Liberty Engine Output.	596
Liberty Engine Production 10,151, Oct. 10.	689
Liberty Engine Production Pennant for Marmon.	813
Liberty Engine Profits Not Excessive.	781

## Dependable Spark Plugs

### Big Increase in Porcelain Efficiency

### Three Times the Resistance to Breakage from Sudden Change in Temperature

**T**HREE THOUSAND four hundred and forty-nine experiments, ten years of unremitting laboratory work—and then came the startling results of—

### *Experiment 3450*

Now you may be virtually certain that the porcelain insulator of Champion Spark Plugs will never break from sudden change in temperature.

Champion Porcelains have always stood up well under temperature changes.

But Champion 3450 Porcelain has three times the resistance to extreme temperature variation compared with the best previous porcelain.

Always Dependable, Champions are now Super-Dependable. Sell Champions.

Champion Spark Plug Company  
Toledo, Ohio

**CONSERVATION** is the word of the hour. Even though economy of gasoline may not be interesting to you personally, still you should conserve from a patriotic point of view. Clean cylinders reduce the gas and oil consumption 12% to 25% and give you the maximum power and speed from the minimum amount of fuel. That knocking in your engine—the difficulty of climbing hills—poor pick-up—lack of power—noisy motor—pre-ignition—in fact, 80% of engine trouble is caused by carbon. Clean it out with

## JOHNSON'S CARBON REMOVER

and your engine will run as it did the first 500 miles—quietly and full of “pep”. Johnson's Carbon Remover will save you from \$3.00 to \$5.00 over any other method, without laying up your car and with much better results. No time or labor required—you can do it yourself in five minutes.

### *Use It Every 1,000 Miles*

If you will use Johnson's Carbon Remover every 1,000 miles or oftener, giving carbon no chance to accumulate, you will automatically eliminate most valve trouble and your engine will always be clean and sweet and at its highest efficiency.

### *For All Gas Engines*

Gasoline Engines of all kinds should be given an occasional dose of Johnson's Carbon Remover—the engine laxative. It will increase the efficiency of automobiles—trucks—tractors—motor-cycles—motor boats—and aeroplanes.

S. C. JOHNSON & SON, Dept. A

### *A Harmless Liquid*

Johnson's Carbon Remover is perfectly harmless. It contains no acids and does not affect lubrication or interfere with the oil in the crank case. Has no action on any metal. Over three million cans used with entire satisfaction.

### *Keep Your Car Young*

We publish an attractive little booklet entitled “Keep Your Car Young.” This is full of valuable information to every man who owns or drives an automobile. We shall be glad to send it to you free and postpaid.

## AUTOMOBILE

VOL. XXXIX

NEW YORK—THURSDAY, JULY 4, 1918—CHICAGO

NO. 1

## Complete Inspection Procedure for Airplane Engines

Inspection Work in Engine Factories Falls Into Four Divisions—A List of  
Things to Be Checked Under Each Heading

By Lieut. P. J. Piccirilli\*

**A**IRPLANE engine inspection may be conveniently divided under four headings, as follows:

- 1—Parts Inspection      3—Inspection on Test  
2—Assembly Inspection   4—Overhaul Inspection

In parts inspection each individual part is inspected separately. Under the name of each part is given a list of important dimensions and other features to be checked up. An inspection of any part under this heading should show whether its further consideration in the assembly is warranted.

It will be noticed that in the parts inspection in a good many cases a number of considerations are omitted to allow for a complete detail inspection. This is based on the writer's experience with airplane engines.

It was very often found that in carrying out a complete detailed inspection on parts, a great many times such parts would fail to pass. On the other hand, in assembling on the engine the same parts which were otherwise rejected would bear the proper relationship with other parts. Therefore, in most cases, to carry out a complete detail inspection on the individual parts, such as camshafts, crankshafts, gears, etc., might give rise to excessive rejection of such parts which, when assembled, would prove serviceable.

For this reason, the writer has included all these details under the second heading and discussed them in connection with the assembly. The advantage of this method of procedure from the points of view of production and salvage is evident. No comment is called for by headings 3 and 4.

### 1—Parts Inspection—Camshaft

1—A general survey by sounding the entire case is very advisable. This will give an idea as to the grade of

casting as a whole and indicate the existence of cracks or welds.

2—Make a careful scrutiny of the inside of the case and note the degree of porosity, especially in the various webs and bosses, paying particular attention to the presence of welds, checks or cracks. The main bearings and bosses should be examined very closely, as very often they are split when studs are set in.

3—Examine gear case for cracks or welds where the magneto base fastens on. See that hole for magneto drive is not bored oversize. Try all tap holes in gear case face with plug gage for oversize.

4—All camshaft bearings must be machined according to drawings. Pay particular attention to the stock under the front camshaft bearing, as the greatest stress due to whipping and vibration occurs at this point (propeller end). Carefully observe the holes drilled for camshaft retaining screws and see that they are not oversize or plugged.

5—Examine deck of upper half of crankcase and, in the case of V type motors, closely watch apex, noting possible cracks, checks or degree of porosity, welds, etc. Note carefully the amount of stock at breather pipe studs and make sure that it is sufficient. Insufficient stock at this point might cause a weakening of surrounding material where studs are set in place. Above all, note that the decks are of equal thickness.

The case should be properly faced for cam follower guides. Cam follower guide holes and cylinder holes should be chamfered. This is to allow these assembled parts to lie flush. Removing all feather edges will also improve resistance of material at the above points.

Allow no defective metal, plugs or welds in the walls between the cylinder decks and the case flanges; also be sure that all engine tie-down lugs are of substantial material, not tolerating defective material of any de-

\*Lieut. P. J. Piccirilli supervised the construction of several hundred Curtiss airplane engines at the Hammondsport plant.

scription, as all stresses due to thrust are transferred through these parts.

See that the case flange is of the proper thickness to give sufficient strength.

6—See that all main bearing shells are tight in place in the bore all around, and flush with the top of the case, being sure to observe that they do not come below the case level, so as to provide a proper fit when the cap is put in place. Otherwise you may have a loose main bearing shell.

Be sure to have all main bearing studs tight in the lugs, and see that the lugs were not cracked when the studs were put in place.

Screws in the main bearings holding the bearing to the case should not be too near the surface of the bearing metal, and the babbitt should be countersunk.

7—In the main bearing caps note the condition of the babbitt and allow no cracks, checks or excessive porosity.

Note possible cracks at stud holes. Cracks in main bearing caps are apt to occur at this point. Very often main bearing caps are injured by turning down the nuts without the washers or plates being in.

8—All case clamping studs want to be tight in the case and of proper height. Note the condition of the threads.

9—See that the gear case face is machined to allow the proper clearance between the gear case cover and the half-time (magneto) gear. Also observe that the screw bosses allow the proper clearance for the magneto gear.

10—Lower half of crankcase should be carefully scrutinized and the degree of porosity noted. Look for cracks, welds or defective material, especially at corners.

In conclusion, see that both upper and lower halves are scraped clean and all sand or dirt is removed.

#### Camshafts

- 1—Check over all measurements of intake cams.
- 2—Take measurement of rear bearing.
- 3—Take measurement of front bearing.
- 4—Take measurement of gear bearing.
- 5—Size of all front bearings and gear bearings (micrometer).
- 6—Scleroscope test of cams and bearings.
- 7—General inspection as to physical properties.

#### Cam Follower Assemblies

- 1—Inspection for alignment of cam followers in guide.
- 2—Scleroscope test.
- 3—General inspection as to physical properties of cam followers and guides.

#### Camshaft Gears

- 1—Sizing of bored or reamed hole.
- 2—Inspection in gear center fixture to insure free running.
- 3—Inspection as to physical properties and finish.

#### Carbureters (Assembly)

This includes a general inspection of the assembly work as follows:

- 1—Inspection of the throttle valve as to fit and alignment.
- 2—Inspection of the throttle valve lever.
- 3—Inspection of the hot air valve and lever.
- 4—Inspection of the wiring of screws.
- 5—Inspection of body, noting degree of porosity.
- 6—Checking up settings.
- 7—See that slow speed adjustment is not plugged.

#### Crankshafts

- 1—Length over all from thrust bearing cap to half-time gear.

- 2—Height and width of propeller hub key.

- 3—Micrometer dimensions of each bearing and crank pin.

- 4—Inspection as to checks in main bearings and crank pins.

- 5—General inspection of half-time gear and oil drive gear.

#### Cylinders (Assembly)

- 1—Length of rocker arm support and manifold studs.
- 2—Dismantling of valves to get size of valve stem guides, condition of valves and valve seats in cylinders, testing of valve springs for pressure.
- 3—Size of bore for out-of-roundness and taper.
- 4—Height from rocker arm support seat to tie-down flanges.
- 5—General inspection of jackets for porosity.
- 6—Test with thread gage of spark plug hole and inlet water nipple.
- 7—Water test, 80 lb. per sq. in.

#### Intake "Y" Assembly

- 1—Inspection of all studs for length and condition of threads.
- 2—General inspection for porosity and condition of finish of inner and outer surfaces.
- 3—Inspection for cracks around stud bosses and water test.
- 4—Water test, 80 lb. per sq. in.

#### Intake Manifolds

- 1—Length of stud bosses.
- 2—Gaging manifold coupling stud hole threads.
- 3—Inspection of inner and outer surfaces.
- 4—General inspection for porosity.
- 5—Alignment of part flanges.
- 6—Water test, 80 lb. per sq. in.

#### Intake Manifold Coupling

- 1—Inspection of inner and outer surface.
- 2—General inspection for porosity.
- 3—Water test, 80 lb. per sq. in.

#### Oil Pump Assembly

- 1—Gaging master gear shaft which drives oil-drive pinion.
- 2—Clearance of gears and running condition of same.

#### Oil Drive Assembly

- 1—Gaging master gear fit in pinion.
- 2—Gaging pinion fit in bracket.
- 3—Checking trueness of bore in bracket to facing of pinion.

#### Piston and Connecting-Rod Assemblies

- 1—Weighing within limits of  $\frac{1}{8}$  oz. total variation.
- 2—Testing of frictional resistance of piston pins in piston.
- 3—Checking skirt for size and distortion with micrometers.

#### Pistons

- 1—Getting side clearance of piston rings with feeler gage.
- 2—Condition of piston pin bearing after being rolled in.
- 3—General inspection for cracks and porosity.
- 4—O. D. of top and bottom of piston.
- 5—Depth and width of ring grooves.

#### Connecting-Rods

- 1—Gaging size of bearings with plug gage.
- 2—See that rods are of proper hardness as may be indicated by scleroscope or Brinell tests.

3—Note length of bolt lugs.

4—General inspection as to porosity, bolts, nuts and bore of bearing.

#### Propeller Hub Assembly

1—Testing with plug gages to determine proper taper and size.

2—Inspection of fit of nuts, radius of bolt heads, cotter pin holes, fit of propeller hub lock nut and tension of propeller hub nut lock spring.

3—Inspection of keyway with gage to see that key is central.

#### Piston Pins

1—Scleroscope test.

2—Location of lock screw holes.

3—General inspection of outer and inner surface.

4—Check up outside diameter for size.

#### Piston Rings

1—Check width with micrometer.

2—General inspection of physical properties.

#### Valve Action Assemblies

1—Inspection of clearance between rocker arms and yokes.

2—Fit of push rod threads in yokes.

3—Distortion of push rods.

4—File test of tappets for hardness.

5—General inspection for cracks and assembly workmanship, note degree of porosity and watch out for soft solder spots.

#### Thrust Bearing

1—General running condition.

2—Obtain width and outside diameter of bearing.

#### Water Pump

1—Note end thrust of shaft.

2—General inspection for porosity of bodies and assembly workmanship.

3—Inspection on hot water running test for leakage.

#### Pressure Pumps

1—Inspection of general running condition at 4 to 5 lbs. pressure.

2—Inspection of bodies for porosity and assembly workmanship.

#### Crankshaft (Balancing)

1—Inspection for static and dynamic balance.

2—Inspection for width and thickness of cheeks.

3—Inspection for fit and finish of oil plugs.

4—Inspection for misalignment of bearings.

5—Gaging propeller hub taper.

6—Gaging thrust bearing lock nut and propeller hub nut threads.

7—Gaging dimensions of propeller hub keyway.

8—Check for trueness.

#### II—Assembly Inspection

Following is a list showing operations for the complete motor which will be referred to numerically in discussing Assembly Inspection:

1—Tap and stud case.

2—Cut fillets and ream.

3—Fit gear covers and clean case.

4—Fit cam followers and cam shaft.

5—Fit crankshaft and oil drive.

6—Fit connecting rods and breather pipes.

7—Fit cylinders.

8—Fit manifolds and valve actions.

9—Fit magnetos, timing wiring.

10—Fit lower half, gear case covers and magneto cover.

11—Fit intake pipes, water pump and carbureter.

#### Belting

1—5-hr. limber run. 2—5-hr. official run.

#### Assembly Inspection Details

##### OPERATION 1. Studding.

1—All stud holes are to be hand-tapped to size and should be slightly countersunk on the inside of the case.

2—All studs are to be hand-threaded to size and all nickel is to be removed from the case end of same, in case of nickeling.

3—All studs should be tried to see that they are absolutely tight in the case.

4—At this point in the assembly the studs are not to be drilled for cotter pins.

5—Note proper location of name plate.

##### OPERATION 2. Reaming of main bearings.

1—Examine all main bearings carefully and note degree of porosity or defective babbitt. Be sure that there is sufficient bearing metal for reaming and that it has a good bond with the shell. Also see that the shell fits tight in the case bore.

2—Examine all grooves and oil retainers to see that they are machined to drawing; also that all screw heads are set deep enough to have sufficient clearance after bearings are finished.

3—After main bearings are finish-reamed in the case, try them for alignment by inserting a testing bar 0.001 in. smaller in diameter than the main bearings. Note that the bar can be rotated freely by hand and moves through the bearings without springing.

4—All bearings must be reamed 0.002 in. larger than the crankshaft main bearings, with a 0.0005-in. tolerance under or over. These working limits on the bearings are determined by plug gages. No burnishing or scraping should be tolerated. The main bearings are to be reamed smooth.

##### OPERATION 3. Case cleaned.

1—Note that fits of gear case cover, magneto drive half covers and thrust clamp are correct.

2—Oil grooves should be cut in thrust clamp and must correspond with those in the lower half.

3—The case should be scraped smooth and all sharp corners removed, and the case should be washed clean with gasoline before proceeding with next operation.

##### OPERATION 4. Camshaft and cam followers assembled.

1—All cam follower guides are to be properly fitted to the case.

2—Examine cam followers for cracks and checks, and see that they have the proper clearance in the guides and do not bind. See that the case is spot-faced under the retaining screws and that they are tight in the guides.

3—See that the cam bearings fit tight in the case and that the camshaft rotates freely in the bearings. All bearings must be reamed 0.0015 in. larger than the camshaft journal, with a 0.0005-in. tolerance under and over. The shaft must have at least 0.002 in. end-play and not more than 0.006 in. end-play. See that the cam followers follow the cams properly.

4—Examine the front cam bearing carefully for cracks.

5—See that all pilot screw holes are tapped to the correct size and that the under side of the screw heads fits flush with the boss.

##### OPERATION 5. Fitting of crankshaft and oil drive.

1—Before fitting crankshaft, examine all bearings carefully and see that they are free and clean.

2—Examine crankshaft, seeing that all pins and main bearings are free from checks, cracks or rust and have

all sharp edges removed from checks. Examine gear and see that all teeth are milled uniformly.

3—Burnishing bearings and scraping should not be allowed unless authorized by inspector. See that sides are filed for crankshaft end clearance.

4—Shaft must rotate freely in bearings. A minimum clearance of 0.045 in. is allowed between the cheek and the side of the bearings on the thrust side, and 0.025 in. on the opposite side.

6—After the crankshaft has been inspected and passed, remove the front bearing. Wire up the main bearing castle nuts. Drill and tap the holes and fix the studs for the oil drive pinion brackets.

7—Apply and fit the oil drive pinion bracket to the front bearing.

8—See that the shaft of the gear rotates freely in the bushing.

9—When fitting, try the gears and line them up. Back lash in the gears to be between the limits of 0.003 in. and 0.006 in. Outside diameter of oil drive to be central with shaft within 0.010 in. and bottom set level within 0.0015 in.

10—After it has been inspected and passed, remove bracket and front main bearing cap. Drill and tap threads in front bearing cap and bracket for retaining screws. Replace bearing cap and finally fix bracket.

11—Replace camshaft gear and try back lash, allowing a minimum of 0.003 in. and a maximum of 0.006 in.

#### OPERATION 6. Fit connecting rods and breather pipes.

1—Assemble breather pipes to case, noting thickness of flange and length of studs.

2—See that holes in studs are drilled correctly for cotter pins to line up with castellation of nuts. Assemble connecting rods and pistons to crankshaft pins. Burnishing of bearings should not be permitted. Examine bearings for porosity and poor bond between shell and bab-bitt.

3—When assembled, try for fit, seeing that all connecting rods have the necessary clearance between bearings and pin. The clearance here should be 0.0015 in. to 0.002 in.

4—See that all nuts have cotter keys and are pulled up snugly.

#### OPERATION 7. Fit cylinders.

1—Note the degree of porosity in the top and lower heads and see that the nickel-plating does not peel off, if the rod is nickel plated. Water jackets to be free from bad dents. See that no cracks occur around the studs and bosses of the water outlet seat. All nuts on the bottom flange of the cylinders must have lock washers and be snugly pulled up. Lock washers to be replaced with cotter pins in overhaul.

2—After cylinders have been fitted, inspect for line-up. Intake faces of cylinders are to be in alignment within 0.005 in. Intake manifolds to be in alignment within 0.025 in. Water outlet seats to be in alignment within 0.025 in.

3—Top of valve stems to be in alignment within 0.005 in.

#### OPERATION 8. Fit manifolds and valve action.

1—Assemble valve actions to motor.

2—Examine rocker arms and try clearance in bearing pins; also look for cracks and machine defects.

3—Turn the camshaft over with special socket wrench to try all valve actions.

#### OPERATION 9. Magneto timing and wiring.

1—Time motor from No. 1 cylinder and mark gears. Make out timing slip and place it with assembly operation

2—Fix name plate.

3—See that all wires are properly insulated. Note conditions of terminals.

#### OPERATION 10. Fit lower half, gear case covers, magneto covers.

1—Reverse motor on stand and rewash it.

2—Make general inspection to see that all is clean before pouring in oil. Oil must be absolutely clean and of specified grade.

3—Clean lower half of case and splash pans. Assemble lower half to upper half. All nuts on flange to be snugly pulled up.

4—Assemble thrust bearing and clamp. Try clearance between oil slinger and inside radius clamp, which should not be less than 0.010 in. all around. See that all fillister head screws are wired.

5—Fit gear case cover to motor. See that screw holes are not tapped oversize and threads not stripped. Clearance between gear case opening and crankshaft gear journal should be between 0.006 and 0.008 in.

#### OPERATION 11—Fit intake pipes, water pump, carbureter.

1—Assemble intake water pipe. See that all nuts on cylinder nipple joints are fastened tight. All rubber connections to be tightly fixed to prevent water leakage.

2—Assemble pressure pump and tachometer drive to motor. See that all fixture screws have lock washers and are snugly pulled up.

3—Assemble intake gas pipe, intake "Y" and carbureter, carbureter supports, brace, etc., to motor.

4—Try lever of butterfly throttle for opening and closing and tension of spring. Try lever of air intake. Try slow speed screws. See that carbureter is fitted and wired up properly and all parts are intact.

5—Assemble hot water pipes to motor.

6—Assemble oil feed pipes to motor.

7—Fix ignition tubes to manifold and set cables.

#### III—Overhaul and Test

1—After an engine has been overhauled or assembled it should have a limber run, in order that all new parts installed can work freely.

2—New engines generally are limbered by power other than their own at about 300 r.p.m., until the motor can be turned over freely by hand.

While thus being limbered motors should be inspected from time to time to note the following:

- (1) Cylinders overheating.
- (2) Overheating of water pump shaft bushings.
- (3) Knocks from piston pins.
- (4) Noisy valve actions.
- (5) All working parts to be well oiled.

3—Oil pressure is adjusted to a suitable figure at about 300 r.p.m. This is done at this time for the sake of convenience.

4. When the engine is run under its own power at 1400 r.p.m. the oil pressure should be between 45 lb. and 75 lb. The best results are usually obtained when the pressure is about 65 lb.

5—Engines having had a limber or belt run should then be given a limber run under their own power for 5 hr., starting the first hour at 900 r.p.m., the second hour at 1000 r.p.m., the third hour at 1100 r.p.m., the fourth hour at 1200 r.p.m. and the fifth hour at 1400 r.p.m.

6—Inspection must be made from time to time to note if the motor is running smoothly.

- (1) No oil leaks.
- (2) No water leaks.
- (3) Magnetos are working properly.

(Continued on page 10)

# Getting Skilled Men by Making Them

Turning Bath Attendants and the Like Into Skilled Machine Operators—What the Training Department of the Norton Grinding Co. Is Doing to Counteract Present Labor Conditions

*General view of the training department of the Norton Grinding Co., which shows clearly that, so far as equipment is concerned, it is just a regular machine shop*

FOR more than 2½ years, at the plant of the Norton Grinding Co. in Worcester, Mass., they have been training employees for special work in a school established for the purpose. They do not call it a vestibule school, and as the term is generally used to indicate that part of a plant where new employees receive a brief and sometimes superficial introduction to the mysteries of regular shop work, the designation "training department" employed by the Norton Grinding Co. is, in their case, more truly descriptive.

Each new employee who enters the training department receives special attention. There is no prescribed course or schedule of hours, days or weeks which govern the particular kind of instruction that is given or the length of time that a student-employee remains in the school. The chief object is to give the men a knowledge of fundamentals and a high degree of skill in a limited field. Just how long it takes an individual to acquire this skill depends entirely upon the natural aptitude of the man himself. Some students remain in the school for 2 and 3 weeks only, and others are there for as many or more months.

While no attempt is made to produce expert machinists, many of the graduates who had a natural gift for mechanics to begin on have shown a remarkable capacity to learn and have attained astonishing proficiency by the time they have finished their training.

The necessity for this school or training department

was made evident during the latter part of 1915, when it became more than ever difficult to obtain men who had previously been trained to the required degree of skill and the increased production demanded by war work made it impossible for the regular foremen to give their time to the breaking in of green help. In December of that year the training department was started and since that time over 300 men and boys have passed through it. The present rate of graduation, as it may be termed, is about five per week.

## Training Is Thorough

Only a little more than one-third of those who go through the school are retained in the employ of the Norton Grinding Co., not because the school fails to turn out a satisfactory product but because the men are, to a large extent, lured away to employment in other establishments. Several of the younger men who have gone through the school, some having had more than 4 months' training, have been accepted by the Navy as second class machinists. This fact alone would indicate that the training is thorough and that it is possible, under the system of instruction employed, to turn out mechanics of considerable ability.

The training department is located in a gallery in one of the mills of the Norton Grinding Co., and is 23 ft. wide by 264 ft. long, having an area of 6072 sq. ft. It has its own tool vault, washroom and toilets.

*A graduate of the training department. After 8 weeks' training he is operating a Warner & Swasey turret lathe, setting up his own machine, and earning about 45 cents per hour*

The machine equipment consists of 17 lathes, 2 vertical milling machines, 3 horizontal milling machines, 1 hand mill, 3 universal grinding machines, 1 shaper, 3 upright drills, 2 sensitive drills, 1 floor grinder, 2 arbor presses, 1 straightening press, 1 gas furnace and 130 ft. of benches.

This equipment was gathered from the various departments throughout the plant and, before the inauguration of the present system of training, was used in these departments for the purpose of instructing beginners. It is evident, therefore, that the training department does not add to the total floor space of the plant. It is in charge of one chief instructor and four assistants.

#### Regular Shop Work Used for Training

The school serves as an "odd job" department, and the instructors may commandeer work from any department in the plant if they happen to be short of that kind of work for instruction purposes. The cost of doing such work is not considered even when it amounts to several times as much as when done under regular production methods. It is considered a good investment to furnish the training department with whatever it needs in the way of regular work, as the cost of any particular job done there, no matter what it may be, is returned many times through the development of skilled employees.

Beginners in the training department are paid a regular wage according to age and previous experience. Men who have done such work as driving grocery wagons or have engaged in similar occupations are paid at the rate of 35 cents per hour. Boys of from 16 to 20 without previous experience are paid from 17 to 20 cents per hour.

As we have said, there is no definite length of time during which student-employees remain in the training department. In some cases it happens that only a few days are necessary to give those of natural intelligence and ability an amount of training sufficient to produce in them a high degree of skill. In other cases, they are in the school for several months. It is estimated that the average period of training is about 3

Foremen throughout the plant have instructions not to employ any unskilled help on production jobs. That is, they must not attempt to teach any beginners themselves how to operate machines or how to assemble them without first taking the matter up with the chief instructor of the school. This method insures the men in the school obtaining the opportunities that arise to get into the shop and at the same time does not prevent any foreman from getting into the school any one in whom he is interested.

As opportunities in the shop arise, the chief instructor of the school takes the men he thinks best fitted to fill the jobs. He does not lose touch with these men immediately after they leave the training department, for it is a part of his work to watch them for a period of several weeks to see whether they are really suited for the work to which they have been put, and it is said that this plan has saved a number of good operators who started out on the wrong line and were eventually diverted to some other kind of work more congenial to them.

The cost department of the plant is notified as each man is sent from the school to the shop, and a special record is made of his work for the 6 months following in order to determine what his earnings are. In this manner an excellent idea is obtained of the value of the men who have gone through the company's training department and how they compare on regular shop work at long-established piecework prices with skilled men who have come through other channels.

It has been found that all but a very few have easily earned up to their day work rating, the average, in fact, being 10 cents per hour over this rating.

#### Some Transformations

It will be interesting to note one or two of the transformations which have been effected in graduates of the training department. A most interesting example of what can be accomplished in such a school is the present foreman of tool makers on the night shift. Incidentally it may be said that he is regarded by the company as being one of the best tool makers they have on their payroll. He had had absolutely no machine shop experience before he entered the training department.

*After 7 weeks' training this man, who had previously been a teamster, has a regular job in the production department sharpening milling cutters*

ment in December, 1915. He had been employed by a firm making paper bags.

A teamster who had also had 2 years' experience in a boiler factory, after 7 weeks in the school, is now in the shop sharpening milling cutters.

A designer in a corset shop, after 5 weeks in the training department, is operating a Brown & Sharpe universal grinder.

Another graduate who had no machine shop experience prior to entering the training department, after 8 weeks' training, operates a Warner & Swasey turret lathe, setting up his own machine, and earns 45 cents an hour or more.

A former attendant in a Turkish bath, after 2 weeks' training, is now in the production department operating a No. 3 Cincinnati horizontal milling machine, and the foreman in charge of the department says that he is a better man than he has been able to get directly through the employment department at the present time.

### The Reasons for a Training Department

A large number of men whose only experience had been in some branch of industry entirely foreign to the machine shop, after a few weeks' training have made milling cutters, machine reamers, arbors and other similar pieces under the supervision of the instructors.

The considerations which led the Norton company to start its training department as stated by John C. Spence, the superintendent in charge, are:

1—Few men have the faculty to teach. Oftentimes the best workman is the poorest teacher. Hence it is easier to find one teacher and let him do the bulk of this work.

2—The press of output prevents a foreman from giving proper attention to beginners even if the foreman happens to be a good teacher.

3—It does not pay to have a high class executive foreman spend time on a beginner any more than a professor of mathematics in a college could afford to put his time into first grade work. In fact, in most cases, he would probably lack the real qualifications for first grade work, i.e., patience and human insight.

4—Unless the schooling is centralized, the corpora-

*Formerly a designer in a corset shop, this graduate of the Norton Grinding Co.'s training department after a 5 weeks' course is operating regularly a B. & S. universal grinder*

tion cannot readily carry out a fixed policy with regard to teachings other than mechanical, i.e., questions pertaining to honesty of product, citizenship, etc.

5—The influence on the future attitude of these men toward each other and toward industry depends largely on the impression made upon them at the start. This should be controlled as far as possible.

6—In a school, the beginner is sure of a variety of work, whereas the tendency in the shop is to give the beginner such a dose of whatever simple work he can do that he will not disturb the foreman again for some time, or as the boys say, enough to "hold him for a while."

7—The training probably costs less in the school than in the shop, although apparently not, as the true cost in the shop is almost always buried in departmental expense. It is there just the same.

*A group of student-employees who are being trained for positions in the production department of the Norton Grinding Co. After a few weeks' training they will become expert operatives*

# Manufacture of Airplane Propellers

*The wood of which the propellers are made is first steamed in these special steaming boxes to make it sufficiently flexible to be easily bent to the required shape*

*This operation shows the press used in holding the thin wood laminations together during the process of fastening*

*The propellers are first sawn roughly to shape with a band saw, the final cut being made by machine*

*This is the machine that trims the rough-sawn propellers to their final shape. Three propellers are trimmed at once*

*In this operation the hubs are centered and fastened in place*

## As Carried On in a French Factory

*Before the propellers are finally polished they are accurately measured*

*Final inspection department, where propellers are subjected to minute scrutiny for imperfections in construction and finish*

*Putting the final touches to a 20-ft. propeller for a naval dirigible*

*Finishing department, where the propellers are varnished and polished*

*Putting on the copper tips, this being one of the last operations completed*

## Complete Inspection Procedure for Airplane Engines

(Continued from page 4)

(4) Take reading of water at inlet and outlet. Intake should be about 110 deg. and outlet 140 deg. F.

(5) Take reading of oil pressure.

(6) Look for oil leaks at thrust bearing and clamps.

(7) Oil leaks at magneto drive shaft oil deflector and crankcase joints.

8—At the end of 5 hr. run, valve clearance must be adjusted to proper valve.

9—Remove oil from sump and replace with clean oil. It is then ready for 5 hr. full power run.

10—Start engine and run 15 min. to warm up—then open up to full power 1400 r.p.m.

11—On this run very careful inspection must be maintained.

(1) Take readings of oil pressure, temperature of water inlet and outlet.

(2) Note overheating of cylinders.

(3) Note proper working of magneto.

(4) Take readings of torque in lb. and static thrust in lb.

12—At the end of 5 hr. full power run, the following defects may appear:

(1) Oil leaks at thrust bearing clamp ring, due to a poor gasket or loose thrust bearing clamp bolts.

(2) Oil leaks at thrust bearing clamp ring, due to not having enough clearance between ring and thrust bearing clamp. Nothing less than 0.010 in. to be tolerated.

(3) Oil leaks at magneto drive shaft.

(4) Inspect for water leaks on all cylinders, water connections and water pump packing glands. Observe carefully brazing of cylinder water jackets at bottom and top, as the brazing sometimes opens.

(5) Valve actions that are out of alignment will be noisy. Weak intake push rod springs will also cause noisy valve action.

(6) Inspect intake and exhaust push rod yoke pins for wear.

(7) Check valve clearance.

(8) Inspect manifold for cracks at flanges, air leaks at manifold gaskets, elbow gaskets, and carbureter gaskets. Air leaks at these points will make engine run uneven and prevent throttling down to low speed. The engine will also overheat.

(9) Carbureter should be checked up for the settings.

(10) Check oil consumption and temperature.

## IV—Overhaul Inspection

## 1—CYLINDER INSPECTION.

(1) Inspect cylinders for score in bore.

(2) Cracks in cylinder head at port holes and around studs. Dents in water jackets.

(3) Test valves with gasoline for tightness.

## 2—INSPECTION OF CONNECTING ROD AND PISTON ASSEMBLIES.

(1) Inspect connecting rod bearings for cracks, scores and porosity.

(2) Inspect pistons for cracks around pin bosses, supporting ribs and skirt. Piston must be free of scores.

(3) Piston pin lock set screw should be tight and wired.

(4) Test piston pin for bearing fit.

## 3—CRANKSHAFT INSPECTION.

(1) Inspect crankshaft main and pin bearing for checks, scored bearings and thrust bearings. Shaft must be clean inside and out.

## 4—CRANKCASE INSPECTION.

(1) Test all studs for tightness in crankcase.

(2) Inspect case very closely for cracks at cylinder stud bosses, bearing cap stud bosses and all supporting members and flanges.

(3) Main bearings must be free from cracks, scores and porosity—bearings countersunk for attaching screws and screws must be kept tight.

(4) Camshaft assembled in crankcase. See that shaft has end play of 0.002 in. to 0.006 in. Other clearances are explained in assembly inspection. All bearings must be tight in case and locked with retaining screws.

Camshaft gear tight on shaft and locked.

Inspect all cams, as checks may have developed.

## 5—LOWER CRANKCASE.

(1) Inspect for cracks at all corners and at oil pump.

(2) See that oil strainer is well soldered at top and bottom, also that supporting strips are well soldered.

6—Inspect gear covers for cracks and porosity.

7—After crankshaft has been fitted in case, it should be free from tight spots and turn freely by hand. All main bearing stud nuts to be securely cottered.

8—Inspection from here on is the same as in the first assembly.

9—Inspection of 1 hr. final test is same as in 5 hr. full power test, except that all readings are taken at 15 min. intervals.

Engines that have had one or two bearings replaced must have a 1 hr. limbering run and a 1 hr. test.

## 10—Final inspection of engines after 1 hr. test.

(1) All nuts to be cottered, except lower cylinder tie-down nuts which are locked with special washer lock.

(2) All screws to be locked with wire.

(3) Lower crankcase must be dropped on all motors that have had three or more bearings replaced. Inspect oil sump.

(4) Rocker arm lock set screws to be locked with wire. Engine to be cleaned and all steel parts covered with oil before shipped.

## 11—OVERHAUL OPERATIONS.

(1) Tear down motor.

(2) Wash and return.

(3) Grind valves.

(4) Clean piston and connecting rod assembly.

(5) Fitting crankshaft and connecting rods.

(6) Replace cylinders, lower pan and cotter up.

(7) Replace manifolds and valve actions.

(8) Replace water pump, carbureter, water pipes finish for test.

Return from test for final adjustment for shipping.

# Airplane Nomenclature

## Names of the Different Types of Planes Used in Warfare and of Their Principal Parts, Together with Expressions for Features of Airplane Design

**T**HE illustrations shown on this and the following pages are reproduced from F. L. Faurote's paper on Airplanes of To-day read before the Society of Automotive Engineers at Dayton recently. Familiarity with the terms used in aeronautics will enable the reader better to follow discussions on aircraft topics. For the purpose of illustration, Mr. Faurote used the standard training machine known as the JN-4D. This machine is a bi-plane of the tractor type, a two seater primary training plane equipped with a 90-hp. eight cylinder aircraft engine.

The illustrations also show the different types of airplanes defined by Mr. Faurote in his paper reprinted in AUTOMOTIVE INDUSTRIES last week. Mr. Faurote divides military airplanes into five classes, viz., combat machines, reconnaissance and photograph machines, battleplanes, bombers, flying boats and hydroplanes.

Mr. Faurote's plan of writing the names of the parts on a large sized photograph of the complete plane has much to commend it. In this way the relation of the

part named to the whole plane is at once made evident. General characteristics of the design, such as span, gap, chord, angle of incidence, dihedral angle, stagger, etc., are illustrated by diagrams in a very clear manner. While to not a few of our readers the terms illustrated and described are household words, to others they are new, and as at the present time practically every one is interested in aircraft and aircraft literature, this brief contribution to the subject of aircraft nomenclature should be of general interest. One cannot well begin the study of any technical science without a good knowledge of its nomenclature.

The rapid strides which have been made in aircraft development during the past four years are well illustrated by the number of different types evolved. In military operations quality of equipment is a very important factor, and in order to secure high quality for any particular purpose, that one purpose must be kept in view to the exclusion of everything else. This leads to multiplication of types.

# War Airplanes of To-Day

## A Comprehensive Collection of Photographs and Descriptions of the Scout, Reconnaissance, Battle and Bombing Planes and Flying Boats in Use in the World War

**I**N his paper, "Airplanes of To-day," which was read before the summer meeting of the Society of Automotive Engineers, Fay Leon Faurate of the Curtiss Aeroplane & Motor Corp. illustrated and described in detail the various types of airplanes in use to-day by the warring powers in Europe and in the training schools in America.

Several of the types which Mr. Faurate took up have already appeared with complete descriptions in past issues of *AUTOMOTIVE INDUSTRIES*. On the following pages we are reproducing illustrations and descriptions of those planes which have so far not been treated fully

in this publication. The latest types of French, British, Italian, German and American planes will be found in the unusual collection of photographs here presented.

The planes shown are arranged in general classes according to the purpose for which they are designed. The pursuit and scouting planes come first. These machines have speeds of from 125 to 135 m.p.h., can carry up to 450 lb. and will climb at the rate of 10,000 ft. in from 8 to 12 min.

Following these small, fast machines come the reconnaissance and photographing machines, which are slower and are intended chiefly for observation work in con-

*Large Curtiss flying boat*

*The big Caproni triplane. Next to the large Curtiss triplane boat, it is the largest triplane that has been built and successfully flown*

*A side view of the Handley-Page bomber*

nection with artillery and general reconnoitering. They have wing spreads of from 40 to 60 ft. and are capable of making from 80 to 100 m.p.h. They are two or three seaters and their climbing speed is about half that of the pursuit and scout planes.

In the third group are the battleplanes, usually equipped with one large or two medium sized engines and a number of machine guns, sometimes even mounting small cannon. They carry two or three passengers and can attain speeds of from 70 to 85 m.p.h.

The bombing planes, which come next, are, so far

as general type goes, similar to the reconnaissance and photographing planes, but somewhat larger. Their radius of operation is from 500 to 1000 miles and their speed from 75 to 100 m.p.h. They have a wing spread of from 45 to 90 ft. and can climb at the rate of 1000 ft. in approximately 4 min.

The author's last classification is flying boats and hydroplanes, which are made in a great variety of types and sizes. They are used for coast patrol work and for naval observation. They are capable of relatively high speed, making from 90 to 100 m.p.h.

## Pursuit and Scout Planes

### BRISTOL TRACTOR MONOPLANE

Small one-seater machine. Span, 30 ft. 9 in.; chord, 5 ft. 11 in. Overall length, 20 ft. 7 in.; height, 9 ft. 6 in. Driven by 110-hp. Clerget that uses about 6 gal. of fuel per hour. Air endurance, about 3 hr. Total flying weight, about 1320 lb., of which 410 lb. is useful load.

This machine requires a clever pilot to fly it, although it is comparatively easy to land. It is nose-heavy and has a

tendency to turn to the right with the engine on. This model is credited with a speed of 128 m.p.h. at 5400 ft. and 110 m.p.h. at 15,000 ft. It will get off the ground in less than 100 yards, and can be stopped, with the engine off, in a little more than the same distance. It will climb about 16,000 ft. in 20 min.

To the eye it presents a pleasing appearance and offers a good example of stream-lined monoplane construction. The

*Front and side views of the Bristol monoplane (English)*

*Bristol scout plane (English)*

dihedral is 4 deg. and the tail plane has a small negative angle of incidence.

#### BRISTOL SCOUT MODEL D TRACTOR BIPLANE

Powered with an 80-hp., air-cooled Clerget, this one-seater is credited with a speed of about 95 m.p.h. It weighs about 1100 lb. and has a wing spread of 24 ft. 5 in. Length, 20 ft. 5 in.; height, 9 ft. 8 in. Its wings have a dihedral of 3 deg., angle of incidence of 2 deg., stagger of 1 ft. 4 in. Its aspect ratio is 5.5; chord, 4 ft. 6 in.; gap, 4 ft. 4 in.

The Bristol Scout is also equipped with 100- and 110-hp. Clerget engines. It is a very easy machine to fly, not at all tiresome, and lands easily. It will climb 10,000 ft. in 26½ min. Its weight is 1099 lb.

#### MORANE PARASOL WITH 170-HP. GNOME ENGINE

This is the only monoplane now in use on the French front, but on account of its good visibility and quick maneuvering ability, it is particularly well liked by many pilots. Span, 21 ft.; gross weight, 1400 lb., and useful load, 500 lb. Its maximum speed is 136 m.p.h. at sea level. It will climb 16,000 ft. in 16 min. It carries two machine guns and gasoline for 1¾ hr. A jack-seat for the gunner is operated by a crank with which he can raise and lower himself. The plane is of steel construction (two-thirds of the fuselage). There are no wires; the bracing is of steel. It has a monocoque

body, a pointed nose and small tail. It is light, speedy, sensitive and very trim.

#### MORANE THREE-PLACE TRACTOR

Two rotary Rhone engines or Hispano-Suiza engines. There are two pairs of vertical struts and two pairs of inclined struts on either side of the fuselage. The landing gear is of a double M shape, and the machine is easily recognized by its fish-like fuselage. Its nacelles, in which the engines are carried, are mounted in V-shaped supports. The upper wing has a slight overhang, no dihedral and no sweepback. The German A.E.G. and Gotha are very much like this machine and many of their features are copied from it.

The propeller is equipped with propeller-pot which aids in cutting down the head resistance of the machine. The planes are cut away for visibility. The elevators are of the balanced type.

The under-carriage structure has an M type of truss, and looks something like the Fokker and Halberstadt—which are German imitations of it.

#### TWO-SEATER POMILIO WITH 6-CYLINDER, 200-HP. FIAT ENGINE

Is 38 ft. wide, 10 ft. high, 30 ft. long and will make 120 m.p.h.; climb 13,120 ft. in 22 min. Two sets of struts on either side of body. Double set of V-shaped struts from fuselage to upper plane. Very narrow but high cowl. Apparatus for release of bombs just below rear cockpit. Movable machine-gun mounted on a rotating ring in rear cockpit.

*Morane Parasol (French)**Rear view of Spad*

*Two views of the Thomas Morse S4C (American)*

The ailerons on the upper plane increase in chord as they leave the trailing edge of the main plane. The trailing edges of the lifting and controlling surfaces are fluted.

#### SPAD FRENCH PURSUIT BIPLANE

The Spad is a single-seater, combat or pursuit biplane, with a 150 to 200-hp. Hispano-Suiza engine. It has a speed of from 120 to 130 m.p.h., and is an excellent example of good streamline design. The panels are of veneer construction, and the beams are made up of an I-beam section with two side pieces wrapped on with fabric. It is a remarkably good example of wood construction, veneer and aluminum being used in a wonderful manner. The French apparently do not like balanced units, but prefer a machine having the sensitiveness that unbalanced units give. It is said that they are much easier to maneuver in battle, can make turns and dive with greater facility. The Spad is so wonderfully made that even bad smashes do not seem to have much effect upon its structure. It has a 25-ft. spread and a 5-ft. chord. The chord is slightly greater than that of the Nieuport. The fuselage is very short.

The machine is very light in construction—almost an engine with wings. The gross weight is 1500 lb., and it carries a useful load of 450 lb. It will climb 10,000 ft. in 9 min. Two years ago with a 150-hp. engine it attained 118 m.p.h.; last year with a 200-hp. engine it reached a speed of 131 m.p.h.

#### S4C SINGLE SEATER (THE THOMAS MORSE CO.)

This is fitted with 100-hp. Gnome or LeRhône 80-hp. engine. It has a wing spread of 27 ft.; length over all, 18 ft.; total weight, with LeRhône engine, 1300 lb. It has a climbing

*Pomilio (Italian)*

speed of 9500 ft. in 10 min. with the Gnome, and 8500 ft. in 10 min. with the LeRhône. It has a high speed of 105 m.p.h. with the rotary and a high speed of 95 with LeRhône.

# Friedrichshafen Bombing Plane

## Details of One of the Latest Designs of German Long Range Bombers

**A**MONG the German types of large bombing biplanes the Gotha is probably the best known; but two other types have been used by the Germans in long-distance bombing flights recently, the Friedrichshafen and the A. E. G. The former is supposed to be the product of the Zeppelin Works located on the shores of Lake Constance and at other places in Germany. It is believed that Friedrichshafens, together with Gothas, took part in the most recent raid on London, and the Aircraft Production Department of the British Ministry of Munitions has issued considerable interesting material concerning this machine.

One of the Friedrichshafen bombers was downed at Isbergnes during the night of Feb. 16 by a direct hit on the right-hand engine from an anti-aircraft gun. The machine when hit was traveling at a height of from 8000 ft. to 9000 ft., and thereafter covered a distance of about 6 miles before landing in a fairly good manner. It would seem to have been of very recent construction, for on the tail appeared the date "14/1/18." On other parts, however, different dates were marked, so that possibly it may have been a somewhat older machine that had been repaired. From data painted on the side of the body, it is to be gathered that the weight of the machine, when empty, was 5929 lb., its useful load 2717 lb., and its permissible total weight 8646 lb.

The general arrangement of the machine is illustrated in the accompanying drawing. Its full complement consisted of four persons, the pilot, a fore-gunner, an after-gunner, and a bomber. The number of the crew carried by this type of machine is, however, known to vary, two only being sometimes carried. The cockpits for the crew intercommunicate in such a way that the men can easily change places.

The machine may be described as consisting of a central section to which are attached the main planes and the forward and rearward portions of the fuselage. This central section comprises the main cell or cabin of the body, wherein are carried the tanks and bombs, and also embraces the engines and the central portions of the upper and lower planes. The central portion of the body measures 4 ft. wide by 4 ft. 3 in. high, and is of box formation. It is carried out in ply-wood, strengthened by longerons and diagonals, and stiffened transversely by ply-wood bulkheads. The bulkhead furthest forward serves as an instrument board, and behind it are placed two seats side by side for the pilot and his assistant. The pilot has a fixed upholstered seat, while his assistant is provided with a light steel tubular folding seat having a webbing back-rest. Beneath these two seats is placed the lower main fuel tank. Behind the pilot's cockpit the body is roofed over with ply-wood. The rear part of this roof is detachable, so as to give access to the second main fuel tank at the rear end of the main body portion. At each side of the cabin or covered passage-way thus formed are racks for small bombs. These racks are each capable of holding five 25-pounder bombs. Beneath the nacelle are two large racks formed of tubular frames and fitted with cradles of steel cable and trip gear. Each of these racks is believed to be capable of supporting a 600-lb. or 700-lb. bomb. The large racks

are readily detachable, for the bombs carried are evidently varied to suit the radius of action over which the machine has to operate. The bomb sight is of the ordinary German non-precision type.

The machine is driven by means of two 260-horsepower six-cylinder Mercedes engines. The engines of the Friedrichshafen bomber show only a few changes in the design, that of chief interest being the fitting of a rudimentary form of silencer to the end of the exhaust pipe. Following are the principal dimensions of the machine:

Span, ft. ....	78
Maximum chord .....	7 1/2
Gap, ft. ....	7
Dihedral angle in the vertical plane, deg. ....	1 1/2
Dihedral angle in the horizontal plane, deg. ....	6
Total area of main planes, sq. ft. ....	924.4
Area of upper main planes without flap, sq. ft. ....	480
Area of lower main planes without flap, sq. ft. ....	454.4
Load per square foot, lb. ....	9.24
Weight per horsepower, lb. ....	16.6
Upper wing, area of flap, sq. ft. ....	21.6
Upper wing, balance area, sq. ft. ....	1.8
Lower wing, area of flap, sq. ft. ....	16
Lower wing, balance area, sq. ft. ....	1.56
Tail planes, total area, sq. ft. ....	57.6
Elevators, sq. ft. ....	32
Balance area of one elevator, sq. ft. ....	1.7
Area of fin, sq. ft. ....	20
Area of rudder, sq. ft. ....	19.2
Balance area of rudder, sq. ft. ....	3
Maximum cross section of body, sq. ft. ....	19.2
Horizontal area of body, sq. ft. ....	133
Vertical area of body, sq. ft. ....	131.2
Length overall, ft. ....	42

## A German Aircraft Speed Meter

**A**SPEED meter for aircraft was described some time ago in the *Elektrotechnische Rundschau*. The mechanism consists of an iron rod or track laid horizontally and in the direction of the aeroplane's length. On this rod is a heavy iron ball, which is normally held at the center of the track by a spring at each end of the latter. When the aeroplane is accelerated the iron ball moves backward from the center of the track; when the machine is retarded the iron ball moves forward. The second part of the mechanism is a horizontal disc rotated at constant speed by clockwork. On this disc rests a small wheel, which is mounted on and can slide along a square shaft. By means of a prong or fork the iron ball moves the small wheel to one side or other of the center of the rotating disc. The direction of rotation of the small wheel (and of its square shaft) and its speed of rotation are thus determined by the direction and extent of displacement of the iron ball, i.e., by the degree of acceleration or retardation of the aeroplane. The square shaft is geared to a recording dial, which indicates the net total revolution of the small wheel at any time. This is proportional to the speed of the aeroplane with regard to the earth. The recording dial may be calibrated accordingly. If the instrument is working properly the speed dial comes back to zero at the conclusion of each flight.

The idea involved in this device is not altogether novel. The theory underlying it is fairly simple and can be worked out without resorting to the methods of the calculus, if we confine ourselves to constant accelerations. In practice, the accelerations with which the device has to deal are in general not constant, and the instrument has to exercise an integrating function. At first sight it might be thought that the inertia of the ball would introduce a disturbing effect, for under a sudden acceleration the ball would overshoot its true position. It would, however, subsequently vibrate with decreasing amplitude about its true position.

# Heavy Oil Engines for Automotive Purposes\*

## Difficulties of Handling Heavy Fuel in Carbureters—The Diesel's Principle, Its Advantages and Shortcomings—Junkers Type Double Piston Engines

By P. L. Scott

THE necessity of developing the heavy oil-burning engine for automotive purposes cannot be too strongly emphasized. The demands for automotive power for the farm, for freight carrying and trucking of all kinds, for the automobile for both passenger and business purposes, for the small power boat, and for the airplane, are increasing by leaps and bounds. We have not enough suitable gasoline to supply even our present requirements, and we have almost no engines capable of successfully burning heavier distillates. The supply of such heavier distillates is comparatively vast, and the heavy oil engine will use this supply much more economically than the gasoline engine uses gasoline.

### Oils as Gasoline-Engine Fuels

The present type of gasoline engine does not burn with success (and by success we mean good combustion at all loads) kerosene, or even a mixture of gasoline and kerosene in which the proportion of kerosene is high; nor do many of these engines burn kerosene well even at full load. This is because kerosene will not volatilize at ordinary temperatures and pressures, and low-grade gasoline, now very common, volatilizes only partly under normal conditions. Volatilization is essential if the oil is to be mixed with the air by any of the present forms of carbureter. The vaporization of the heavier oils can be assisted by heating, but even then is not sufficient to produce a complete and homogeneous mixture of oil vapor and air. If gasoline and kerosene are placed side by side in two receptacles exposed to the air, the gasoline will disappear by evaporation long before the kerosene. Attempts to apply heat frequently fail of their object because the heat does not sufficiently aid in volatilizing the oils, and, more

important, because it decreases the weight of oxygen drawn into the cylinder of the engine. The amount of power is dependent upon the amount of fuel that can be burned, and the amount of fuel that can be burned is dependent in turn upon the amount of oxygen that can be drawn into the cylinder at each charging stroke. Heating of the air decreases its density, consequently reduces the amount of oxygen and correspondingly cuts down the power output.

Many have expressed the opinion that the next logical step to meet the fuel situation is the design of an engine especially suited to the burning of kerosene or of the lower petroleum distillates and the lighter and possibly "middle oils" resulting from the by-product distillation of coal, and not an attempt to adapt engines designed for a volatile oil to the use of relatively non-volatile oils.

### Burning Low-Grade Liquid Fuels

The author believes that with a heavy fuel engine some means other than carburetion must first be provided for the most intimate mixing of the fuel and the air, and that some means of igniting this mixture other than an electric spark is necessary. A heavy oil cannot be successfully mixed with air in a carbureter, and a spark cannot successfully ignite a mixture in which the oil is not to a considerable extent vaporized. Carbureters fail to form an intimate mixture of heavy oils with air because the heavy oils do not volatilize sufficiently well, and the mechanical division of the oil secured in the carbureter is never sufficiently fine to form a combustible mixture. Heat applied to the carbureter in order to assist in volatilizing the oil results in heating the air, and thereby reduces the output of the engine. An ordinary electric spark will usually fail to ignite a mixture of heavy oil and air because the source of heat is too localized

\*Paper read at the S. A. E. summer meeting.

Fig. 1—Small double piston, two-stroke cycle A. E. G. oil engine direct-connected to generator

Fig. 2—Junkers aeronautic four-cylinder two-piston engine, with cranks at opposite ends geared together

and the flame propagation is much slower than in the case of a readily volatilized vapor mixed with air. Further, as the compression used is increased the resistance to passage of the spark is decreased, owing to the increased density of the air.

#### Injection and Ignition

The alternative is to use purely mechanical means for dividing and mixing the oil with the charge of air. In the Diesel engine this mixing is successfully accomplished by using highly compressed air, delivered by a compressor attached either to the engine or driven separately, to blow the oil into the cylinder at the moment when combustion is desired. The pressure in the cylinder is from 400 to 700 lb. per sq. in. and that of the injection of air is from 50 to 100 per cent higher. The proper quantity of oil for one cycle is delivered to the fuel valve during each stroke and at the right moment is forced by this air pressure through passages and holes of various shapes and sizes into the cylinder. A certain amount of the air escapes from the valve with the oil.

This method has one great advantage. The oil and the air, under a pressure considerably higher than that in the cylinder, become thoroughly mixed during the passage through the valve, so that when the pressure is suddenly decreased, say from 800 lb. in the valve to 500 lb. in the cylinder, the oil, already well divided, is subjected to a violent explosive action that tears the small drops apart and produces a finer division, thus rendering the fuel readily combustible. Further, combustion is readily started because each particle of fuel is provided initially with a small amount of air in close contact with it.

This system has several disadvantages. An air compressor is an unwelcome piece of apparatus, doubly so for high pres-

ures and for high speeds; and is not to be thought of for speeds required for automotive engines. When the pressure is suddenly decreased on the entrance of the injection air into the cylinder, the expansion causes a decided refrigerating action upon this air, which is in closest contact with the oil. This action will actually prevent combustion when too much air escapes through the valve. From 5 to 10 per cent of the indicated horsepower is required for the operation of the air compressor. Therefore, although producing an excellent spray, air injection cannot be considered for high-speed engines required in most automotive applications.

Surface ignition engines, at least the smaller sizes, have no air compressor, but inject the oil directly under pressure ranging from 1000 to 3000 lb. or more per square inch. In nearly all designs the oil is forced through an extremely small hole, a few thousandths of an inch in diameter. This gives a fairly good spray, but not one so finely divided that the fuel burns when brought into contact with air at temperatures resulting from the compression pressures used. Further, such sprays are subject to "dripping," that is, the formation of drops of appreciable size before or after injection, or often in the spray itself. This causes excessive carbonization and poor combustion. Therefore, hot surfaces are introduced into the cylinder and the oil allowed to impinge upon or pass near these surfaces. This causes a partial distillation of the oil and furnishes the additional heat necessary for combustion. These conditions tend toward operation on the Otto cycle and the compression pressures, therefore, are kept relatively low to avoid excessive end pressures.

The "direct-injection" system has many merits. With it the air compressor is eliminated, thereby doing away with an expensive and troublesome piece of apparatus and saving 5 to 10 per cent of the indicated horsepower. This saving is

Fig. 3—Oil engine of tandem construction for farm tractors

net because a high-pressure oil-pump is required whether there is an air compressor or not. The system eliminates the refrigerating action of the compressed air. So far it has had the serious drawback that the fuel spray produced does not burn nearly so well as the "air injection" spray, but in this respect some real improvements are being made and practical success is being obtained.

We must work along the line of direct injection in order to develop the heavy oil burning engine for automotive purposes. Enough progress has been made to assure us that it can be done without great difficulty. The author has observed a successful test of an oil pump pumping benzine at 450 atm. (6390 lb. per sq. in.) at about 800 r.p.m. A more recent development has operated well at 7000 lb. and 1150 r.p.m. High pressure in the oil pump at high speed is an essential requirement for successful direct injection.

Assuming that we can succeed in this mechanical mixing of oil and air, we must next devise a means for igniting the mixture. This can be accomplished either by compressing the air to such an extent that the temperature attained will cause ignition, or by permitting parts of the combustion chamber to reach such a temperature that action similar to

that in surface ignition engines occurs. The two methods may be combined, in which case the results are the best. If hot surfaces are used, care must be taken not to allow the incoming air to flow over them, since this will have the same disadvantages as heating the air in the carbureter, namely, reducing its density. Most of the heat necessary under these conditions should be secured from the air. The attempt to burn a heavy oil by mechanical injection into highly compressed air makes the time element of combustion important; much more so than with engines in which the fuel is to a certain extent vaporized and is more intimately mixed with the air, so that combustion is virtually instantaneous, or explosive when the mixture is ignited by an electric spark. This means that the speed of mechanical injection engines must, at least at the beginning of their development, be slower than is customary with present gasoline engines, because the burning of oil under the conditions of direct injection is slow as compared to the burning of gasoline vapor in air.

It is well to speak here of the distinction between the explosion and the combustion engine, as engines burning heavy oils are essentially of the combustion and not of the

explosion type. All engines intended to burn the lighter hydrocarbons are, from the nature of the fuel, most easily designed to operate on the Otto cycle. The fuel volatilizes readily and can be drawn into the cylinder with the air and compressed, provided the compression pressure is not too high, and the mixture then ignited. The rise in pressure due to the chemical reaction is almost instantaneous and is the so-called constant volume, or explosive, combustion.

The heavier oils, however, will not mix so intimately with air, and the heat of the air must be relied upon to a great extent to aid in the union of the fuel and the oxygen; consequently combustion is never so rapid, but approaches the constant pressure conditions found in the Diesel cycle. A mechanical condition prohibiting the use of the Otto cycle for heavy oil engines of the proposed type is that the comparatively high compression pressure necessary would produce prohibitive explosion pressures.

The development of direct injection in large engines has conclusively proved that heavy oils, even residues, can be sufficiently finely atomized by mechanical means to burn successfully with compressions as low as 250 lb. per sq. in., provided the combustion space is allowed to remain warmer than in ordinary practice. Direct injection has proved far more successful in small than in large sizes.

The author has experimented with a spray nozzle which in its present design will atomize a 28-deg. Baumé oil finely enough for the particles to remain suspended in the air for ten minutes. Such a mixture will ignite explosively upon the application of a match flame, which is a small and localized source of heat.

Bearing the foregoing considerations in mind, we see that the design of injection engines will differ radically from that of the usual type of gasoline engine.

In the first place, the engines will be of considerably slower

Figs. 4 and 5—Details of a portable injection oil engine with a single horizontal working cylinder and an air compressor cylinder on the opposite side of the crankshaft

On left: Fig. 6—Photographic view of the engine illustrated in Figs. 5 and 6. Below: Fig. 9—Pistons, connecting rods and crank in the firing position

rotative speed than is possible with gasoline engines. With better design we can secure higher speeds, but satisfactory operation at 1000 r.p.m. would now be considered a creditable attainment. We must, therefore, for the present make up our minds to use slower speeds. The slower speed engine will naturally be larger and heavier than the gasoline engine to which we are accustomed, particularly when operating on the four-stroke cycle; but we must remember that the first gasoline engines were truly clumsy affairs when compared with present designs. The engines will not need to be much heavier for strength to carry the high compressions because the maximum pressure will not be much greater, although the mean effective pressures will be higher. But the cylinder and piston design will be more difficult, since the mean temperatures will be considerably higher. Because of the slower speed and probable increase in size and weight there will doubtless be a reversion at first to engines with larger and fewer cylinders. It will probably be more economical to build two-cylinder than four-cylinder engines of this type. Further, a small cylinder for an engine of this type requires such a small quantity of oil that the fuel pump design and governing are difficult.

Fig. 7—Another view of the engine

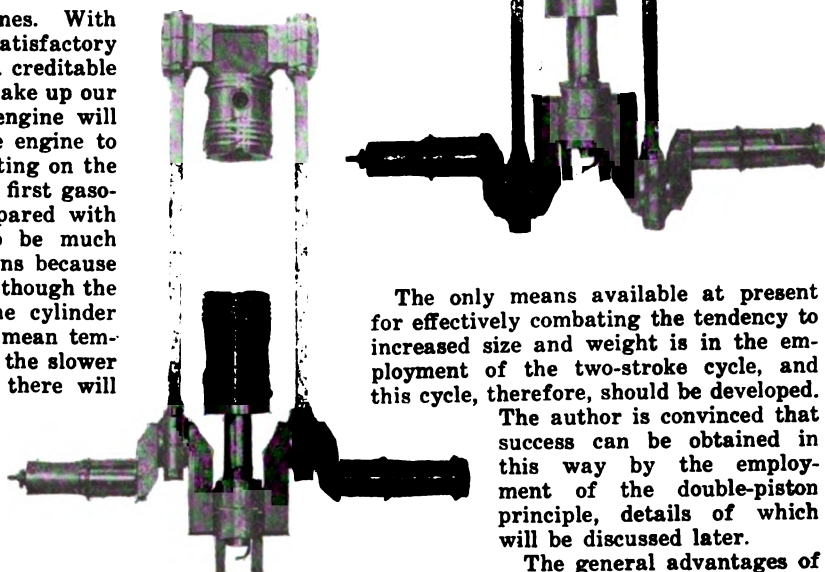

Fig. 8—Pistons, connecting-rods and crank, showing great length of stroke

The only means available at present for effectively combating the tendency to increased size and weight is in the employment of the two-stroke cycle, and this cycle, therefore, should be developed.

The author is convinced that success can be obtained in this way by the employment of the double-piston principle, details of which will be discussed later.

The general advantages of heavy-oil engines for automotive purposes can be summed up as follows:

They will be simple in construction, since the spark-plug, magneto and carburetor will be dispensed with, these

being replaced by fuel pump and valve, less complicated and more reliable elements.

They will burn much cheaper fuels and will have a much lower fuel consumption than the present gasoline engines.

The consumption of gasoline engines varies from 0.5 to 1.5 lb. per b.h.p. per hr. or higher, depending upon such factors as the compression ratio, quality of carburetion and load. If we take the average gasoline consumption as 1 lb. (air-plane engines not considered) and the cost of gasoline as 25 cents per gallon, the fuel cost is  $3\frac{1}{2}$  cents per b.h.p. per hr. High-speed Diesel engines have burned from 0.45 to 0.7 lb. per b.h.p. hr. of fuel. Six-tenths of a pound may be taken as an average. At a fuel cost of 7 cents per gallon this is equivalent to 0.6 cent per b.h.p. hr. for fuel to operate such engine, or about one-sixth that for the gasoline engine. On this basis it would seem to be a necessary step in the conservation of our natural resources to encourage the development of the heavy-fuel type of engine.

Injection engines will be as flexible or more so than gasoline engines, and more economical at reduced load and speed, since the high compressions advisable for normal speed will insure compressions at low speed always well above the burn-

ing point of the oil, and since the trouble arising from changes in the efficiency of the carbureter at varying speed due to the varying suction will be entirely eliminated. The characteristics of the fuel injection depends on the shape of the cam for driving the pump and is constant for all speeds. There is a well-authenticated report of a single-cylinder engine of the injection type in this country which has run at speeds from 160 to 1600 r.p.m., a truly creditable performance.

Such engines will have the disadvantage of larger size and weight in their initial development stages, and cylinder and piston trouble and lubrication difficulties will probably be experienced, owing to the much more severe heat conditions. Further, some time will undoubtedly be required to educate the public to such a radical change in the type of motive power. However, the design of the heavy-oil engine represents a simpler and far more exact problem than that of the gasoline engine, and this should make rapid development possible.

The author has been experimenting recently with an injection engine of which the general arrangement is shown by the Figs. 1 to 6 inclusive.

This engine was designed along lines which were known to have been proved successful in other engines. The next step in the development is shown in Fig. 10.

From data already at hand, combustion at high speed in such a construction is known to be possible.

The present engine has but a single cylinder, 5-in. bore, 10-in. stroke, and is expected to develop 40 hp. at 700 r.p.m. It is 55 in. over all and 22 in. wide over the crankcase, or 31 in. over flywheel and driving gear.

By comparing the figures showing the piston at inner and outer dead center (Figs. 8 and 9) the long stroke compared to the short crank is readily noted.

The vertical construction shown has two cylinders of 4-in. bore and 6-in. stroke, and will develop 35 hp. at 800 r.p.m., or 44 hp. at 1000 r.p.m.

These figures are for compressions of 700 lb. per sq. in. and 115 lb. per sq. in. brake mean effective pressures.

The vertical-type construction is 28 in. long, 24 in. high and 10 in. through the engine.

Both these engines can be built to carry 50 per cent overload.

The present engine has, at the time of this writing, been on the test block a week, and has performed as follows: Starting on first trial on fuel oil, 600 r.p.m. on fuel oil and 700 r.p.m. on kerosene, with ability to go faster, 13 hp. at 400 r.p.m., and an hour's continuous run without trouble.

## Rolling Resistance of Tractor Wheels

By E. F. Norelins, M. E.

THIS is written as a discussion on the article by Amos F. Moyer, published in the May 16 issue of AUTOMOTIVE INDUSTRIES.

The writer has not had an opportunity to study in detail the various formulæ which Mr. Moyer has derived, showing the relation between the wheel functions. The relations of these functions, brought out are very interesting, as brought out by actual tests and theoretical formulæ, however, are very interesting.

Without doubt, work of this kind will be of considerable value in enabling tractor engineers to compare results obtained with different methods of drive, without actually making field tests. Of course, it is understood that in order to get the correct foundation for this theory, it would also be neces-

Fig. 10—A two-cylinder vertical type of portable engine

sary to make some preliminary tests. With a proper foundation, however, it would be possible to develop the relation between different functions so that engineers would be able to make valuable use of them.

In connection with the derivation of the relation between these functions, there is a quite different method of analyzing the forces involved. Referring to Fig. 1 of Mr. Moyer's article and using the same letters representing certain functions, it may be assumed that the ground pressure under the wheel must be normal at all times to the surface of the wheel, and that the bearing value of the soil  $n$  is proportional to the depression of the soil. To make the problem clear, we will fill the half segment surrounded by the lines  $a$  and  $b$  and the circular portion of the wheel with a liquid, whose density per cubic inch equals  $n$ , which is the same as the bearing value of the soil referred to above. This liquid will produce pressures on the inside of the rim exactly equivalent to the exterior pressures under the assumption of ground conditions that were made in Mr. Moyer's article. And, therefore, all forces which previously were transmitted from the ground to the rim of the wheel will be balanced by the interior pressures caused by this liquid. The value of  $P$  would now be equal to the horizontal components of the pressure of the liquid on the rim which is equal to the pressure of liquid on the element  $d$ . The unit pressure at the lowest point of the wheel equals  $dn$ , therefore,

$$P = \frac{1}{2} d^2 F n \quad (1)$$

The weight supported by the wheel rim is equal to the weight of the liquid which has been put into the rim, or,

$$W = A F n \quad (2)$$

where  $A$  represents the area of the half segment of the circle below the ground which was filled with the liquid.

In equations (1) and (2) we have values for  $P$  and  $W$ . The value of  $P$  agrees with equation (6) by Mr. Moyer, which, as far as the wheel is concerned, is dependent upon the depth of depression and the face, and, as can readily be seen, is correct, as the work that is done with a certain depth of depression of the wheel and ground conditions, is dependent entirely upon speed of motion ahead. From the above, a value of  $G$ , the equivalent grade, can be determined:

$$G = P/W = d^2/2A \quad (3)$$

The above gives a very interesting analogy and a very simple method of analyzing the various forces and functions in wheel resistance.

# Medical Problems of Air Service

## The Human System Cannot Adjust Itself Rapidly Enough to Change in Atmospheric Conditions During Swift Climb

IT is rapidly being realized that there is a distinct need for the establishment and maintenance of a special department of the medical service for the aviation branches of the armies of the allies. This need develops from the fact that there is a set of medical problems involved in aviation work distinctly different from those of the other branches of the service and that these problems extend into branches of physiology not commonly investigated by the average army medical man.

The physiological problems which are to a large extent, if not absolutely, peculiar to aviation work are those which result from the rapid changes in barometric pressure to which the aviator is subjected, the special demand for clear and accurate vision and the nervous strain created from the conditions under which he does his work.

In an address before the British Parliament recently Sir Watson Cheyne, dealing with the medical aspects of aviation, pointed out that the human being was constructed to live upon the earth, and his mechanisms are consequently adjusted and linked together for living under conditions as they exist on terra firma. He was not built with the idea that he should live in the water or very high up in the air.

In high altitude flying two important conditions differ from those encountered at low altitudes. They are the differences in atmospheric pressure and in the density of the air. The latter is especially important, as with the decreased density the proper amount of oxygen is not available.

### Rapid Change in Atmospheric Conditions

While it is possible for people to live at sea level or 5000 or 6000 ft. above it and to go from one altitude to the other without great discomfort when the transition is not too rapid, the aviator with the fast climbing planes of to-day reaches two or three times these heights within a few minutes after having left the earth. Mountain climbers spend a day or two in reaching a height of 10,000 ft. and the human mechanism has time to adjust itself in those cases to the changing conditions.

As the aviator mounts he comes into air that does not contain as much oxygen as is necessary and in order to take in a sufficient amount he begins to breathe faster and his heart beats quicker. In some cases, at a considerable height, the heart will fail, the man will lose consciousness and may actually faint. This fainting may not in itself be fatal, but it is possible, of course, that the aviator may not recover consciousness until it is too late to regain control of his machine.

To counteract the lack of oxygen in the rarefied air, aviators are now provided with oxygen for inhalation. There is found to be a decided difference in the heights to which they go before they are required to make use of the oxygen supply.

The average length of flying life of the army aviator is very short owing to the large percentage of invaliding through loss of flying nerve. Flyers are exposed to a severe strain which comes from many sources and affects most of the senses in ways which are different from those with which in normal life they have become more or less accustomed. Furthermore, the aviator experiences a most intense loneliness when flying over the enemy's lines at high altitude, and this feeling is even worse when flying over the sea.

Other causes of nervous strain are the extra work made necessary by the fact that spells of fine flying weather must be used to the greatest advantage, and the constant strain caused by the anti-aircraft guns of friend as well as foe.

It has been found that when as a result of these and other causes a pilot develops a tendency to estimate his chances and to lose confidence in the powers of himself and his ma-

chine he should be given a leave of absence, and it is quite necessary that this leave should be given before there are signs of insomnia and tremor, or otherwise the aviator may never fully recover so that he will again be fit for flying work.

The virtues of chewing gum as a nerve stabilizer are commended by one authority who holds that, while aviators are mostly temperate in the use of alcohol, they smoke altogether too much, especially cigarettes, and he therefore feels that gum chewing should be more widely encouraged.

The tragic side of over-straining the nervous system through continuous high-pressure aviation work was shown by W. F. Bradley, Paris correspondent of AUTOMOTIVE INDUSTRIES, in the second installment of the life story of Captain Georges Guynemer which appeared in the June 6 issue of AUTOMOTIVE INDUSTRIES. The approach of the end of the career of France's greatest ace was indicated in the following paragraph: "Persistent ill luck followed Guynemer during the last few weeks of his life. After bringing down fifty-one machines he was recommended to retire and occupy himself with the construction of airplanes. Further, the doctors stated that he was wearing out his nervous system, and counseled a complete rest. But the fever of activity burned within him to such an extent that not only did he refuse to go to the rear, but he declined the opportunity given him to rest for a while. Shortly afterward he went out alone one day and never returned."

Air service, besides developing the physiological problems due to rapid barometric changes and nervous strain, also brings out unique problems of vision, and these problems form the basis of some of the strongest arguments in favor of the establishment of a distinct medical branch for the aviation forces. It is essential that the vision of the aviator should be investigated by methods which, although well known to experts, are so technical in character that the average medical man cannot avail himself of them.

### Problems of Vision

As the British *Medical Journal* points out, many authorities have given us "much information respecting the differing sensitivities to various stimuli of the foveal and extra-foveal retina. The Purkinje phenomenon is a familiar example, as is its development into the complex phases of so-called recurrent vision. The special responsiveness of the extra-foveal retina to stimuli of feeble intensity and its relation to the perception of moving stimuli render the activity of this part of the visual field extraordinarily important for estimating movement and for vision under feeble intensities of light. The rare but well-defined condition of night blindness exhibits the disadvantages of pure foveal vision to an extreme degree."

All of this pertains to a branch of pure physiology upon the use of which many lives and the results of important military operations may depend.

In selecting airplane pilots it is quite necessary to determine whether they have true binocular vision, which is most important, especially in flying at high speed and for the rapid connection of sight and action. It is often discovered that one eye is not used at all. The man with this deficiency should not be permitted to enter the air service as a flyer.

It is felt by the advocates of a separate aviation medical department that the medical man of this branch of the service should stand in about the same relationship to the aviator as the trainer does to the athlete. He should have the authority to say whether or not a man should fly at any particular time and to determine when the man should be given leave. The average army medical officer is not considered to be qualified for such responsibilities.

## New Stewart Products

**S**EVERAL new products have recently been announced by the Stewart-Warner Speedometer Corp., Chicago, of which an industrial model vacuum system and a truck speedometer are of particular interest to engineers and manufacturers.

The industrial model vacuum system, known as Model 146-A, has a heavier tank and is built stronger than the previous models. It is specially designed for use on trucks and tractors and with stationary engines. The capacity is much larger and the flow of gasoline is faster. This new model is made in two sizes, one with a round shell of 3½ pints capacity and the other with a D shaped shell of 5 pints capacity.

This model has a flapper check valve in the gasoline line at the top of the tank which prevents the gasoline from flowing back when the suction ceases. This keeps the gasoline line always full, so that the instant the float chamber empties the filling process begins.

The air vent is made of the Venturi type to insure rapid emptying of the inner chamber into the lower chamber. The inner chamber has a double flapper valve which allows this chamber to be emptied in half the time that would be required with a single flapper valve.

A cork float is used in this model. The cork is heavily coated with Acco coating to prevent it from getting loaded with gasoline.

A removable strainer in the gasoline outlet leading to the carburetor catches any sediment in the gasoline and keeps it out of the carburetor. The tank is supplied with a petcock at the bottom to draw off gasoline for cleaning and priming purposes, or water which may have gotten into the gasoline.

The Stewart Model 131-M truck speedometer was designed for Government use, the object in view being to produce a speedometer which would withstand the severe jolts and

vibration to which the instrument is subjected on a truck. It consists of a Model 131 speedometer enclosed in an aluminum shell which takes up the jolts and shocks when driving and protects the instrument from breakage due to carelessness in loading, etc.

The instrument has a 30-mile rotating speed dial, a 100,000-mile season and a 100-mile trip register, with a reset knob set parallel to the face. The face of the instrument is set at an angle, which makes the figures very easy to read from the driver's seat. Model 131-M is attached to the dash by four wood screws.

## Vanity Case Type of Dictograph

**T**HE General Acoustic Co., New York, for a period of a little over a year has been manufacturing an instrument enabling the occupants of a closed car to readily communicate with the driver. A new type of this device, known as the vanity case type, has just been brought out. All that is visible inside the car is a small transmitter plate and two push buttons. One button operates the buzzer which notifies the driver; the other button is depressed while talking. As soon as the pressure on this button is released, the circuit of the dictograph is opened and the driver cannot hear anything that may be said inside the rear compartment.

There is nothing to be put to the mouth while talking. One simply talks in a natural tone and from a natural position toward the transmitter plate, and the sound reaches the chauffeur without any action on his part. The Packard company of Detroit installed a dictograph in a special way, drawing the upholstery over the transmitter plate, so that all that is visible is four small openings corresponding to the openings in the plate. We understand, however, that practically all of the bodies which are being built locally for the Packard company of New York are fitted with the vanity case type.

*The Motor Dictograph and its appearance when installed in an automobile's vanity case*

## Labor Turnover

**A**S a result of our present abnormal industrial activity the demand for factory labor is far greater than the supply. Workmen are well aware of this condition, and they often "throw up their jobs" for what seem trivial reasons. The "Men Wanted" sign is up at nearly every factory employment office and the newspaper advertising columns are full of "Help Wanted" ads, so they know they will have no difficulty in securing employment elsewhere. Moreover, as many concerns are making every effort to draw labor from other plants, it is no wonder that factories where the working and other conditions are unpleasant are losing men as fast as they can hire them and have an amazing "turnover."

One of the reasons why workmen often leave the crowded war-industry centers is lack of proper housing facilities. On a recent occasion when the subject was discussed a manufacturer remarked that most of the beds in workmen's boarding houses in

his neighborhood had to serve for double shifts, and another said he could go one better in that he knew of a case where a rooming house with eight rooms accommodated ninety men. Men may bear up with such conditions for a while, but they soon tire of them and look for a chance somewhere else.

There has recently been a remarkable increase in the interest in welfare work, which is directly related to the subject of "turnover." This welfare work is aimed at making the working conditions so agreeable to the workman as to tie him to his job. It seeks to protect the health of the men while at work in the factory by providing proper safeguards. It also aims to look out for the well-being of the men during their hours of freedom, by providing suitable housing accommodations and opportunities for wholesome entertainment. It seeks to protect the families of employees by encouraging the formation of benefit associations and protecting the men against loan sharks.

In the past such extensive welfare programs have been carried out only by a small number of very large firms and they have been generally looked upon either as a form of advertising, a form of philanthropy or both combined. It seems, however, that we are rapidly reaching a point where every large industrial employer will have to resort to this means in order to keep his turnover within bounds. A large turnover means operating at low efficiency, because it means operating largely with green hands all the time. In many of the old-established plants the working force divides into two distinct groups—those who have been definitely bound to the firm and who stick in spite of tempting offers from outside, and the floaters.

## Catering to the New Demand

**O**NE of the great lessons which we Americans shall learn from the war is the lesson of economy, of "carefulness in outlay," of "freedom from extravagance" as the word is defined in the dictionaries. We shall gradually, in fact we are already, unconsciously acquiring habits of thrift. We are beginning to realize that it is as necessary to save our material resources as it is to save our money. We are beginning to appreciate what waste means and how the wasteful methods and practices of ourselves and others increase the burden which we help to bear.

Extravagance is rapidly becoming old fashioned—out of date. We are giving more and more thought to getting what we should for what we pay. We are acquiring, without realizing it, an abhorrence for wastefulness and inefficiency.

This new point of view, this changed attitude of the American public, will modify all its actions and activities. Buyers will be governed by new considerations. They will not go about with yard-sticks of efficiency nor measure up their purchases according to definite standards of economy. They will not, as a matter of fact, realize that they are buying in a manner differing from the way in which they formerly bought. But the seller must know that they

are. He must adapt his methods and his merchandise to the new demand.

Automobile manufacturers will do well to consider now how this changed buying attitude is going to affect them, how they must meet it with altered products and with modified selling policies. Many, as we know, are already taking it into account in planning their post-war program. More must do so, and eventually will.

### The Call for Efficiency

The demand for economy and efficiency in operation will become stronger day by day and will be one of the chief considerations of the designer of post-war models. Buyers will be interested more in miles per gallon than in body lines and as much so in miles per dollar of tire expense as in hill-climbing abilities. They will inquire more deeply into replacement cost and will more carefully consider depreciation. They will exercise that "carefulness in outlay" which is true economy.

But this does not mean that the demand will be only for low-priced, light-weight cars. In fact, neither price nor weight has more than an indirect bearing on the matter. The inefficient low-priced, light-weight car will be no more popular than the inefficient high-priced heavy vehicle. There will always be a demand for the qualities which the "big car" has. But those who seek these qualities will choose them where they find them accompanied by the more desirable quality of efficiency. For this class of buyers luxury and economy must be brought together.

## No Restrictions on Truck Manufacturers

AT the recent convention of the American Drop Forge Association at Buffalo, T. C. Powell of the U. S. Railroad Administration appeared as a representative of the Priorities Board to explain the present system of priority rulings.

This is naturally a most important matter to the drop forge concerns, as all of their product is subject to priority ratings. Probably the most important statement made by Mr. Powell, from the automotive standpoint, is that motor trucks intended for other than military purposes are regarded as essentials by the government, and their production will not be interfered with. This, of course, does not mean that materials, fuels, etc., used in motor truck manufacture will not be subject to government control, but it does mean evidently that in establishing priority ratings, motor truck manufacturers will be fully taken care of.

The statement referred to was made in direct reply to a question by a manufacturer of gears for motor vehicles, tractors, etc., and should be reassuring to truck manufacturers, some of whom, we understand, have been in dread of a cutting off of their supplies by the Priorities Board. In view of the urgent need for transportation facilities and the great services that are being rendered by motor

trucks in transporting essential materials and commodities, this view of the Priorities Board is a thoroughly sound one.

## Industrial Trucks in Manufacturing Plants

SOME ten years ago it dawned upon the dockmaster of one of the large transatlantic lines that muscle power had become too slow and too expensive for handling freight on docks and in consequence an order was given for the first lot of electric industrial trucks ever placed in service. Since that time the industrial truck has almost ousted the hand truck from steamship piers and railroad yards and it is now making its way into manufacturing plants. Electrical energy can be purchased at a couple of cents per kilowatt-hour less than 1 per cent of what has to be paid for human muscular energy, hence the advantage of using electric power wherever possible is obvious. Of course, human labor cannot be entirely dispensed with; but the drudgery can be taken out of the work and labor can be made ever so much more productive.

The great possibilities of the industrial truck have been well shown by its development on steamship piers. The original truck has even been largely succeeded by tractors which haul five or more trailers on which the freight is carried. A start has been made in employing female labor for driving these trucks and coupling up the trailers. If it were not for the use of these electric trucks and tractors the handling of heavy freight would probably be about the last line of work in which female labor would replace male labor. However, operating these electric trucks and hooking on the trailers to the tractors is work well within the physical limitations of woman. All of the necessary safeguards are provided, and the truck or tractor automatically stops if the operator should be thrown from his seat. Operation of the trucks is a very simple matter, and a new driver can be broken in in a day or two, though it is to be expected, of course, that his skill will increase with further experience.

In automobile, truck, tractor and aircraft factories, and especially in those departments where the heavier work is done, overhead cranes or hoists and monorail installations are usually found. The industrial truck covers a field that cannot well be served by the hoist or crane, which latter is limited to the reach of its track. These trucks can be used for transferring material from one department to another and the tractors are also adapted to moving completely assembled vehicles from one department to another, as from the assembly floor to the paint shop.

Not that the use of industrial trucks in automobile plants is an absolutely new idea. Many of our largest plants are using these trucks. However, this application is comparatively new and is in the ascendancy, and now that a large number of new plants are going up for war work and others are being adapted to new uses the subject merits having attention drawn to it.

## Concentrate on Nine Tire Sizes

Remainder to Be Eliminated During 2½-Year Period—Plan Well Received

NEW YORK, July 1—The finally completed program of the War Industries Board to eliminate all but nine standard sizes of pneumatic tires and concentrate on straight-side types, except in two cases, is viewed with nothing but jubilation by both tire manufacturers and tire dealers. The nine sizes which are to be made will provide plenty of variety to equip all sizes and styles of passenger vehicles and also light delivery vehicles.

It is the plan of the War Industries Board gradually to eliminate a great number of odd sizes for which there has been little call and for which substitute sizes and types are readily available. Thus, for example, some 10 sizes in little demand are to be discontinued Nov. 1, 1918; four more will be eliminated Nov. 1, 1919, and nine more on Nov. 1, 1920. There seems no reason why this gradual elimination should impose hardships on either tire makers, tire dealers or the owners of cars. Following are the sizes that are to be continued without change:

### Class A

(Plain and non-skid treads)

Size	Rim
30 x 3½.....	ClIncher
32 x 3½.....	SS
31 x 4.....	ClIncher
33 x 4.....	SS
34 x 4½.....	SS
35 x 5.....	SS
36 x 6.....	SS
38 x 7.....	SS
40 x 8.....	SS

The following sizes are to be discontinued Nov. 1, 1918:

Size	Rim
30 x 3½.....	SS*
32 x 3½.....	QD*
32 x 3½.....	Cl*
33 x 4.....	QD*
33 x 4.....	Cl*
35 x 4.....	SS*
29 x 4½.....	SS*
32 x 4½.....	QD*
33 x 4½.....	QD*
36 x 4½.....	QD*
36 x 4½.....	SS†
34 x 4½.....	QD*
37 x 4½.....	SS*

\*Non-skid. †Plain tread.

The following sizes are to be discontinued Nov. 1, 1919:

Size	Rim
33 x 4½.....	SS†
36 x 4½.....	SS*

35 x 4½.....	QD*
37 x 5.....	QD*

\*Non-skid. †Plain tread.

The following sizes are to be discontinued Nov. 1, 1920:

Size	Rim
30 x 3.....	Cl†
32 x 4.....	SS†
34 x 4.....	SS†
32 x 4½.....	SS†
33 x 4½.....	SS†
35 x 4½.....	SS†
33 x 5.....	SS†
35 x 5.....	QD*
37 x 5.....	SS*

\*Non-skid. †Plain tread.

Although the number of sizes and types to be eliminated is considerable, the list has been carefully worked out and for each size or type done away with there remains one which can be substituted for it. Thus, for example, where a QD size is eliminated a straight side size remains, and this can be used on QD rims by the addition of a bead filler strip. Similarly, where a size has been eliminated in both straight side and QD, it is quite possible to use what heretofore has been termed an oversize.

The effect of the standardization on nine sizes will be to reduce very greatly the machinery required in tire making. Tire makers will be able to concentrate on a few sizes and turn these out in correspondingly greater quantities. The action should operate to eliminate shortages in certain sizes which have become prevalent of late.

On the side of the tire dealer the action is excellent. It permits him to stock only nine standard sizes instead of a much greater number that always has been necessary heretofore. It is estimated that by the time for the elimination of certain sizes car owners will have anticipated to a sufficient extent to permit the change being made without difficulty.

Although nothing specific has been said about it, it is understood that the order is to apply to both fabric and cord tires.

That the move to standardize sizes is quite agreeable to car manufacturers is evidenced by the fact that both the National Automobile Chamber of Commerce and the Society of Automotive Engineers have signified their approval of the plan.

### White Heads Transport Operations

WASHINGTON, July 2—Walter White of the White Co., Cleveland, has been appointed in charge of operations for the Motor Transport Service under Col. F. Glover. Mr. White takes the place vacated by the transfer of Lieut.-Col. James Furlow to the general staff; he will have charge of the operation of army trucks in this country.

## Exports of Gasoline Increase

April Figure 4,500,000 Gal. Ahead of Last April—France Biggest Buyer

NEW YORK, July 2—During the month of April the United States exported four and one-quarter million gallons of gasoline more than it did during April, 1917, and for the 10 months ending April, 1918, as compared with a similar period in 1917, the increase was nearly 25,000,000 gallons. Of the 20,862,303 gallons exported in April, 1918, France received nearly one-third, with the United Kingdom next taking approximately one-fourth, and Canada and Cuba next with about one-seventh each. Following are export statistics for April, 1917 and 1918, and for the 10 months ending April, 1918:

	April, 1918 Gal.	April, 1917 Gal.
France .....	6,177,083	5,267,106
Italy .....	1,588,900	4,712,638
Unit. King.....	4,527,365	
Canada .....	3,324,560	1,274,684
Panama .....	54,104	100,950
Mexico .....	38,658	57,374
Cuba .....	3,086,913	35,895
Argentina .....	10,000	598,971
Brazil .....	111,100	547,850
Uruguay .....		50,000
Venezuela .....	157,185	132,452
Australia .....	448,400	600,750
New Zeal .....	657,810	1,884,194
Philip. Isl.....		100,000
Brit. So. Af.....		339,450
Other countries....	670,235	901,756
Total .....	20,862,303	16,604,130

### Ten months ended April, 1918-1917:

France .....	48,646,118	52,056,033
Italy .....	26,651,703	12,318,071
Unit. King.....	56,818,949	48,252,299
Canada .....	23,207,667	17,525,387
Panama .....	1,210,309	792,367
Mexico .....	952,433	449,955
Cuba .....	6,037,323	1,207,811
Argentina .....	2,139,586	2,025,294
Brazil .....	4,666,648	4,658,965
Uruguay .....	400,020	193,400
Venezuela .....	436,985	675,337
Australia .....	6,839,215	6,123,320
New Zeal .....	6,008,459	5,747,054
Philip. Isl.....	1,496,604	2,187,580
Brit. So. Africa.....	2,414,240	3,081,930
Other countries....	9,624,375	15,862,561
Total .....	197,550,639	173,157,267

### Major Wall Now a Lieutenant-Colonel

WASHINGTON, July 2—Major W. G. Wall, who was chief engineer of the National Motor Vehicle Co., Indianapolis, has been promoted and is now a Lieutenant-Colonel. Col. Wall has just returned from the American Expeditionary Forces in France where he was investigating motor equipment, including tractors and tanks.

## To Close Washington M.A.M.A. Office

Work to Be Continued by War Service Committee in Charge of A. W. Copland

NEW YORK, July 2—It is altogether likely that the Washington office of the Motor and Accessory Manufacturers' Association will be closed in the near future. At the last meeting of the association a resolution was introduced placing in the hands of manager L. M. Bradley the matter of closing the office, or keeping it open if in his discretion sufficient need for such service remains. Although nothing definite has yet been decided upon it is probable that the office will be closed the end of this week.

The closing of the office will not mean the abandonment of the work which it has been carrying on, however. This is to be continued under the active supervision of A. W. Copland, who is chairman of the association's War Service Committee and who is at present in charge of the Washington office.

The establishment of the Washington office, which is housed in the Ouray Building, was done with the object of assisting members and the government in war work. Since the establishment of Regional Purchasing Departments, however, much of the work done by Mr. Copland and his assistants now is being done by the government. Furthermore, many of the M. A. M. A. members who were in line for government work have received it, so that the need for the Washington office is passing rapidly.

President Stiger is to call a conference of the War Service Committee of the association for Friday of this week at which future work of the committee will be discussed and decided upon. This meeting is to be held in Detroit.

### Two Lincoln Men Out

DETROIT, July 2—Rex Johnson, production manager, and Glenn Johnson, purchasing agent of the Lincoln Motors Co., have resigned. W. W. Goss, of the Condon-Carpenter Co., Providence, has been appointed in the place of Glenn Johnson.

### Grant Heads Kerosene Equipment Co.

DETROIT, July 1—At a stockholders' meeting of the Kerosene Equipment Co., a Delaware corporation, the following officers were elected: President, George D. Grant, president of the Marx Brass Works, Detroit, and director of the Grant Motor Co., Cleveland; vice-president, J.

W. Racklycoft; secretary, R. J. Sherman; treasurer and general manager, E. E. Schwarzkopf. Announcement of the appointment of a sales manager will be made shortly. The officers, with Frederick C. Billings, president of Billings & Spencer, Hartford, Conn., make up the board of directors. The company has started production of its carbureters in its plant at 74 East Fort Street.

### Two Tire Companies Raise Prices

NEW YORK, July 2—Two tire companies, the Lee Tire & Rubber Co., and the Endurance Tire & Rubber Co., have increased prices of their tires beginning July 1. Lee tires are up 5 per cent and Endurance 10 per cent. There does not seem to be a general disposition to raise prices on the part of the other large companies, but one or two have expressed the opinion that increases may be looked for in the near future. The new prices follow:

Size	Lee Old Price	New Price
30 x 3.....	\$15.70	\$16.50
30 x 3½.....	20.00	21.00
32 x 3½.....	23.50	24.70
31 x 4.....	31.00	32.55
33 x 4.....	33.05	34.70
34 x 4.....	34.25	36.00
34 x 4½.....	45.55	47.85
36 x 4½.....	48.40	50.85
35 x 5.....	55.90	58.70
37 x 5.....	59.15	62.10
	Endurance	
30 x 3.....	\$20.35	\$22.40
30 x 3½.....	26.15	28.75
32 x 3½.....	30.25	33.25
31 x 4.....	38.90	43.90
33 x 4.....	42.65	46.90
34 x 4.....	44.00	48.40
34 x 4½.....	53.30	64.10
36 x 4½.....	61.90	68.10
35 x 5.....	69.85	76.85
37 x 5.....	74.00	81.40

### Find Emerson Motors Guilty

NEW YORK, July 2—The Emerson Motors Co., Kingston, N. Y., and four of the brokers who sold its stock have been convicted by a jury in the Federal District Court of using the mails to defraud. President George A. Campbell, his son George Campbell, who is treasurer, George B. Gifford, a director, and Will H. Stetson, a promoter, were found not guilty. All of these individuals, as well as the Emerson company, were tried on an indictment of 13 counts, 12 for using the mails to defraud and one for conspiracy.

### Wright-Martin Production 25 a Day

NEW YORK, July 2—The Wright-Martin Airplane Corp. is reported to be producing engines at the rate of 25 a day, this being an increase of 5 a day over the production a month ago. It is expected that the new plant in Long Island City will be ready for operation soon and that production will be brought up to 50 engines a day before the end of the year.

## Some Steel in Sight for Cars

Steel Mills Urging Automobile Plants to Contract for Future Deliveries

NEW YORK, July 2—Although the steel situation is still in a more or less unsettled condition, some ray of hope is seen by those who have been watching developments with a discerning eye. Now that the President has approved the agreement made by the Price-Fixing Committee of the War Industries Board with representatives of the iron ore, pig iron and iron and steel interests, an air of comparative quiet reigns; prices are not to be altered until Sept. 30, 1918.

It is still impossible for anyone to know with any degree of accuracy, the quantity of steel that will be required by the government in the filling of war orders, for ships, etc. And though the steel makers are quite frank in their statements regarding the impossibility of making shipments at the present time, it is understood on excellent authority that they are urging automobile makers to engage in contracts for future deliveries.

It is stated that within the next 90 days the government will find that it cannot absorb the entire output of the mills and that it will be forced to permit deliveries to non-war industries in order to obviate the possibility of trouble in the various steel plants.

### Sale of Paige Denied

DETROIT, July 1—The rumor that the General Motors Corp. is about to purchase the Paige-Detroit Motor Car Co. is unfounded according to H. M. Jewett, president of the latter company. The Paige company has been approached a number of times in the past by the General Motors Company with offers to sell and the recent visit to the east of Mr. Jewett who sought an interview with W. C. Durant of the General Motors caused an over-zealous newspaper correspondent to write a story to the effect that Jewett's visit was prompted by a desire to go through with the deal. As a matter of fact, the conference between the two men dealt only with the steel situation.

### Turnbull Sales Handled at Defiance

DEFIANCE, OHIO, June 27—The truck sales division of the Turnbull Motor Truck Co. has been transferred from Fostoria, Ohio, to the factories at Defiance.

## Federal Trade Commission Finds Many Companies Made Huge Profits

Fixed Price Plan Helps Swell Dividends—War Work Profiteering Found—Steel Profits Without Precedent—False Reports of Gasoline Shortage Circulated

WASHINGTON, June 29—Large profits are made by low cost concerns under the governmental fixed price for the whole country plan.

The outstanding feature on the score of profit is the trade tendency to increase and maintain prices against the forces of competition.

Considerable profiteering due to the necessities of the Government exists.

Steel profits, due to the Government price fixing, are without precedent.

Reports of gasoline shortage have been circulated for the purpose of maintaining the high prices and heavy profits which gasoline producers are enjoying.

These and other important findings are announced to-day by the Federal Trade Commission in a report to the President of the United States Senate.

The Federal Trade Commission is operating to secure information on the present range of profits in various industries through three activities:

a. Cost finding by the Commission for the War Industries Board, Food Administration, Fuel Administration and other executive departments which have called upon the Commission for this work.

b. Industrial surveys undertaken by the Commission at the direction of the President or upon its own initiative.

c. Enforcement of the law against unfair methods of competition.

### Many Industries Reviewed

Under these activities the Commission has had recent view of many industries handling basic materials including steel, copper, zinc, nickel, sulphur, lumber, coal and petroleum and its products. It has also had daily contact with the tendencies of the trade and revealed through numerous complaints filed for the application of remedies under the powers of the Commission.

The outstanding revelation, states the Commission report, which accompanied the work of cost finding, is the heavy profit made by the low cost concerns under a Governmental fixed price for the whole country. The Commission states that it has reason to know that profiteering, due to advantages taken of the necessities of the times as evidenced in the war pressure for heavy production, exists. Some of this profiteering, it is said, is attributable to inordinate greed and bare-faced fraud.

"In the case of basic metals, as in steel, when the Government announced a fixed price, it was made so high that it would insure and stimulate production. This has resulted in giving a wide margin of profits. Under the device of cost plus a margin of profit, these profits are necessarily great in the case of the low cost mills. Thus while the market was pre-

vented from running away, as it would have done undoubtedly if it had not been regulated by a fixed price, the stronger factors in the industry are further strengthened in their position and enriched by profits which are without precedent."

Following is the important part of the text of the Federal Trade Commission report:

"The experience with steel, shows that a high stimulating fixed price, while stabilizing an ascending market, produces an economic situation which is fraught with hardship to the consuming public and with ultimate peril to the high-cost companies through increasing the power of their low-cost competitors.

### Petroleum Market Surveyed

"In this connection a survey of the petroleum field shows that the market, when under the control of dominating factors, such as Standard Oil, can be one of huge profits without the device of the high fixed price. No price for the public has been fixed upon petroleum and its products by the Government.

"Unlike the situation in steel, flour and coal, there has been as yet no Government interference with the law of supply and demand except in the instances of Government purchases.

"Under that law large profits may eventuate through the bidding up of prices by anxious buyers. And, moreover, even in the absence of this element, prices may be forced up by spreading false and misleading information concerning the condition of supply and demand.

"Reports, for instance, have been circulated that the supply of gasoline was endangered for the purpose of maintaining the high price of that product and the heavy profits from it. At different stages of the oil industry different products of petroleum have yielded the heavy profits. Kerosene was once the chief profit producer. Gasoline followed and superseded it as the chief producer of profits.

"Enormous profits are now being made in fuel oil, with the advantage to the refiner that the high price of the product meets no popular challenge. Gasoline is maintained at its present high price and procures heavy profits for the low-cost refiners.

"Payment of extraordinary salaries and in some instances bonuses to executives of corporations have been found by the Commission during its investigations. An illuminating example of high remuneration, charged to the expense account, is that given by the American Metal Co., Limited, of New York, the chief dealings of which are in zinc. Ap-

pendent are the salaries and tantieme (French—an interest, commission of proportional amount) of some of the chief officials.

B. Hochschild, Chairman of Board of Directors ..... \$179,663.36  
C. M. Loeb, President ..... 364,326.73  
Otto Sussman, Vice-President ..... 221,596.04  
J. Loeb, Vice-President ..... 147,930.69  
Sol. Roos, Manager St. Louis office. 148,580.69  
M. Schott, Manager Denver office. 136,553.12

"In addition to the information above given, the Federal Trade Commission occupies an advantageous position where it is possible to view certain tendencies in trade which bear upon the problem of profiteering.

### Can Prevent Unfair Methods

"Under the law the Commission has power to prevent unfair methods of competition and it is daily in receipt of complaints which it investigates and, if it has reason to believe that an unfair method has been used, arraigns the party complained against for a hearing of the issue. It has developed that, outside legitimate increases in price due to higher costs and other economic elements, certain members of trade have preyed with avarice upon the consumers.

"Another trade practice has developed in which the consignee refuses goods after shipment because the market has fallen, and vice versa the consignor refuses to ship on a rising market. These instances, which in the knowledge of the Commission have not been numerous, have been handled by the Commission in connection with the Food Administration and its power of revocation of license.

"Still another trade practice which has increased the price of supplies to the consumer has been that of commercial bribery, upon which subject, this body recently addressed the Congress, suggesting remedial legislation.

"Again, the trade tendency of manufacturers maintaining the resale price of wares has contributed to holding high the general price level and in instances has increased profits without question. The action of the courts and the Federal Trade Commission in prohibition of this policy is becoming generally known to the trades and will, in our opinion, work a correction by opening up some of the closed channels of competition.

### General Trade Excellent

"In submitting the subjoined memoranda on the industries under consideration, the Commission expresses the opinion that general trade, as the Commission has opportunity to view it, is in a high state of prosperity. With some exceptions that condition has continued for several years past. Many of the industries are making unusual profits, some are showing outrageous ones. In an hour of national service and self-sacrifice, profiteering may be defined not only as the taking of an exorbitant profit, but should include a refusal to share in bearing the burdens of war in the form of a reduction in profits when the profits have been large in pre-war times.

## Steel

"In 1917, the steel companies made abnormal profits in the period prior to the Government price fixing policy, and a number have continued to make unusually heavy profits since that policy was inaugurated. In finding costs in this industry for the War Industries Board, the Commission divided the steel makers into four groups:

"(1) The fully integrated mills.  
"(2) The mills which start with the manufacture of pig iron.

"(3) The mills that start with steel furnaces.

"(4) The mills that make rolled products from purchased semi-finished steel.

"The United States Steel Corp. is included in Class 10. Its profits expressed in terms of the total amount invested in the business shows net earnings as follows:

1912.....4.7%	1915.....5.2%
1913.....5.7%	1916.....15.6%
1914.....2.8%	1917.....24.9%

"The figures, as to the net income of the Steel Corp. as shown by the company for the years 1912, '13, '14, '15, '16, and '17 before deducting Federal Income and Excess Profits Tax in 1917, follow:

1912.....\$77,075,217	1915.....\$97,967,962
1913.....105,320,691	1916.....294,025,564
1914.....46,520,407	1917.....478,204,343

"The Federal Income and Excess Profits taxes of the Steel Corp. for 1917 were \$233,465,435, which leaves from net income \$244,738,908, of which about one-tenth was applicable to interest on bonds of the corporation and the rest available for dividends and surplus.

"From information in possession of the Commission, mills in Class 2 appear to have made heavy profits in 1917. Recently, mills in Class 3 made objection that the Government prices were too low for them. A special examination of their profits by the Federal Trade Commission showed that in almost every case these objecting mills were enjoying unusual returns.

"The following table of percentage of return on investment in ten mills in Class 3 will show the profits in 1917:

	1917 Per Cent
Allan Wood Iron & Steel Co.....	52.63
Allegheny Steel Co.....	78.92
American Tube & Stamping Co.....	40.03
Central Iron & Steel Co.....	71.35
Eastern Steel Co.....	30.24
Forged Steel Wheel Co.....	105.40
Follansbee Bros. Co.....	112.48
Nagle Steel Co.....	319.67
West Penn Steel Co.....	159.01
West Leechburg Steel Co.....	109.05

"Mills in Class 4, which buy the semi-finished steel and convert it into the more highly developed steel products, have enjoyed substantial profits.

## Copper

"Very large earnings have been made in the copper industry on the whole, although it should be noted that they have been due in part to an unusually heavy demand for this metal, which is used almost exclusively for war purposes directly and indirectly.

"The Commission's figures show that 21 companies, including a large proportion of high-cost companies, made profits in 1917 which ranged from 1 per cent to 107 per cent on their investments. The average profit was 24.4 per cent. Probably over 70 per cent of the production is marketed at profits over 20 per cent on investment.

"These same companies show an average profit of only 11.7 per cent in 1913, which may be considered to be a normal year. Thus the average profit in the industry has more than doubled. The range of profits in 1913 was from 1 to 56 per cent.

"The profits used in these computations do not include Federal income or excess profits taxes, and, therefore, represent sums actually retained by the companies for addition to surplus or dividends.

"There does not appear on the whole to have been any concerted action in this industry in putting prices up in the first instance. The war scramble among the Allies shot the prices of copper and other metals to almost unheard of levels. But there are certain strong interests among the producers and marketers which predominate in certain stages of production, and these appear to have taken steps to maintain prices at unnecessarily high levels.

"In the first place, the smelters, and notably the American Smelting & Refining Co., have continued to hold in force certain deductions for risk of carrying copper bought from mines, which risks have ceased to exist. These deductions were put in force during the early period of the war, before price was fixed by agreement with the War Industries Board.

Their present maintenance amounts to profiteering at the expense of the miners, especially the small producers. On the other hand, some of the larger and richer mines have contracts entered into before the war running for periods as long as 20 years, which are extremely advantageous to them and which are now causing some refineries to operate at a loss.

## Zinc

"Most of the evidence in the Commission's possession indicates no unusual

profits in the zinc industry, with the exception of the operations of the New Jersey Zinc Co.

"The following net earnings and dividends are shown for the New Jersey Zinc Company according to published statistics; 1916, profits, 72.5 per cent, dividends 76 per cent; 1917, profits 56 per cent, dividends 46 per cent. The Federal Trade Commission's figures as to these same net earnings and dividends are available only for 1916, and indicate profits of 95.9 per cent, with dividends of 76 per cent.

"These large earnings do not indicate excessive profits on metallic zinc. The company's profits on common spelter are very low, and on Grade A spelter while high are due to the fact that it possesses a natural monopoly of a certain high grade ore, the product of which cannot sell for less than the zinc produced by competitors. In fact, the whole explanation of the New Jersey Zinc Company's large profits lies in its possession of an ore body of unusual richness and purity.

## Petroleum and Its Products

"The data secured by the Federal Trade Commission for 106 refining companies for the first quarter of 1918, supplemented in certain cases by returns for the second six months of 1917, indicate that the average profit in the oil industry is about 21 per cent on the investment.

"This is a considerable increase over the rate of profits indicated for pre-war years, as the Commission's gasoline report indicates an average profit for the years 1913, 1914 and 1915 of 15 per cent on the investment. In 1917 over 50 per cent of the estimated production was produced by companies having a profit of over 20 per cent on the investment. Rates of profits ranged from losses up to 122 per cent.

"The profits of the Eastern refiners have been relatively larger than those on the Pacific Coast. The situation in the East is due to the fact that, while gasoline prices have been but slightly advanced, the prices of other products have been increased greatly, especially the price of fuel oil. The public knows little about prices except the price of gasoline, and to a less extent kerosene. Formerly

## New York Dealers Join N. A. D. A.

More Than 100 Enroll in Growing Organization—Movement Spreading Rapidly

NEW YORK, July 1—More than one hundred dealers of New York, Brooklyn, the Bronx and towns north and east within 100 miles enthusiastically rallied to the support of the growing National Automobile Dealers' Association at a meeting at Reisenweber's this noon. More members were secured than was believed possible. Brooklyn joined its twenty-one members in a body.

At the meeting President F. W. A. Vesper of the National explained in a 45-minute talk the work the association has done and is doing at Washington and elsewhere to safeguard the rights of the dealers and was followed by Executive Secretary E. E. Peake, who told of the need for greater numerical strength.

The 5000-in-90-days membership campaign has started with good results. At a meeting in Pittsburgh Thursday night 208 dealers of that section joined. In Harrisburg Friday night 40 joined. A meeting is being held in Philadelphia this noon at which it is expected the Pittsburgh and New York meetings will be duplicated.

From the East the campaign will move west for a few days with meetings in Cleveland, July 9, Indianapolis, July 10, and Minneapolis, July 12. Later there will be another group of eastern meetings including Newark, N. J., Boston and several New York state cities.

Advices from the N. A. D. A. headquarters in St. Louis state that applications are pouring in from all sections. Meetings and organization plans are being perfected, in addition to the cities mentioned, in Clinton, Iowa; Fort Dodge, Iowa; Des Moines; Joplin, Mo.; Richmond, Va.; Waterloo, Iowa, and San Antonio, Tex.

The war conservation plan worked out by President Vesper and the War Service Committee, a feature of which is the closing of service stations and salesrooms nights, Sundays and holidays, is sweeping the country.

### Fix Acid Prices

WASHINGTON, June 29—Prices for sulphuric and nitric acid have been fixed following conference between the manufacturers and the War Industries Board. The following maximum prices per ton of 2000 lbs. were agreed upon and approved by President Wilson, taking effect at once and expiring Sept. 30, 1918:

Sulphuric Acid—60° Baumé, \$18; 66° Baumé, \$28; 20 per cent oleum, \$32; f.o.b. at makers' works in sellers' tank cars. In carboys in carload lots, ¼ cent extra per lb.; in carboys in less than carloads, ½ cent per lb. extra; in drums, any quantity, ¼ cent per lb. extra.  
Nitric Acid—42° Baumé, 8½ cents per lb. b. makers' works in carboys.

A schedule of maximum prices will be issued later after completion, relative to mixed acids.

The above maximum prices were agreed upon for the public as well as the Government. Deliveries made after Sept. 30 will be subject to any revision in price which the Government makes after that date.

### Automotive Electric Meets July 10-13

NEW YORK, July 1—The semi-annual meeting of the Automotive Electric Association is to be held at the Lake Placid Club, Lake Placid, N. Y., July 10 to 13 inclusive. Aside from routine business the following papers are to be presented: "Standardization in Problems in the Starting and Lighting Industry," by B. M. Leece; "Size and Performance of Batteries in Relation to the Size of Engines for Work to Be Done," by C. F. Gilchrist, chief engineer Electric Autolite Corp., Toledo.

### Regal Sold at Auction

DETROIT, June 28—The machinery, equipment and property of the Regal Motor Car Co. was sold June 26 by the Security Trust Co. acting as receiver for the company. The total assets of the company were listed by the receiver as \$1,137,140.82. In this was included some machinery, which was later sold to the Government for \$41,000, about 5 per cent in excess of its inventoried worth. The balance was sold to Maurice Rothchild, one of the largest creditors, for \$500,000. The sale has not been confirmed by the court as yet. A petition has been filed requesting that an investigation into the company's affairs be made first and that a new receiver be appointed. It is charged that the Security Trust Co. is both receiver and trustee for the bondholders, the majority of whom are Maurice Rothchild and J. B. Livingston, who petitioned for the receiver. This is the basis for the request that a new receiver be appointed.

### \$50,000 Prize For Atlantic Flight

WASHINGTON, July 1—A prize of \$50,000 to be awarded by the Government of the United States to the aviator or aviatrix who is first to fly across the Atlantic to England by any reasonable direct aerial route is proposed in a joint resolution introduced in the House yesterday by Representative Lunn of New York.

### Garabed Proves a Failure

WASHINGTON, July 1—"Garabed," the free energy invention of Garabed Giragossian, is a failure according to the report of the scientists appointed to investigate the machine. The committee appointed announces that it does not believe the principles of the inventor sound, or his devices practical, or that they could result in development of free energy.

## Advises 8-Hour Day for Government

War Labor Policies Board Also Suggests Time and a Half for All Overtime

WASHINGTON, June 29—An 8-hour day wage rate, with overtime at the rate of time and one-half for all mechanics and laborers employed by the Government, was recommended by the War Labor Policies Board to-day. The board further recommended that mechanics and laborers employed upon construction work should be paid in the same way. It found, however, that while a uniform application of wage provisions as ordered by President Wilson in March on all Government work would tend to eliminate labor trouble, it would at the same time interfere with and hamper Government departments in securing supplies needed in the prosecution of the war. The board also decided that a conference should be held in the near future to determine to what extent during the period of the war the adoption of the basic 8-hour day principle of determining wages is feasible.

### Government May Take Aircraft Plants

WASHINGTON, July 1—The Senate Aircraft Investigating Committee, according to rumors here, will recommend that the Government take over all aircraft factories and run them under direct official supervision. Discoveries by the committee in some of the factories visited, it is said has brought the belief that in no other way can aircraft production be put on a basis which will enable it to catch up reasonably soon with the rest of the army. There are also rumors of profiteering by some of the concerns having aircraft contracts with the Government. The committee's report is expected to be made after Congress returns from the summer recess about Aug. 15.

### Cadillac Advances Prices

DETROIT, July 1—The Cadillac Motor Car Co. has advanced the prices of all its models, effective to-day. The old and new prices follow:

	New	Old
Open models.....	\$3220	\$2970
Brougham, 5 passenger.....	4090	3840
Victoria.....	3615	3365
Town limousine.....	4360	4160
Town landaulet.....	4510	4310
Landaulet.....	4490	4290
Limousine.....	4395	4195
Chassis (125 in.).....	2690	2490
Chassis (132 in.).....	2770	2570
Chassis (145 in.).....	2810	2610

### Two New Redden Units

CHICAGO, July 1—The Redden Motor Truck Co. has enlarged its line by the addition of two new products, one a universal truck maker, which has been designed to fit any make or model of passenger car, regardless of the kind or location of the transmission mechanism, and a four-wheeled trailer.

## To Use Motor Trucks Instead of Tubes

### President Vetoes Pneumatic Conveyor Contracts for Postal Service in Large Cities

WASHINGTON, June 29—President Wilson's vetoing of the annual Post Office Appropriation Bill on the ground that it provided for the continuing of the pneumatic mail tube systems in New York, Chicago, Boston, St. Louis and Philadelphia is a noteworthy endorsement of the motor truck, as the President's objections to the continued use of the mail tubes are based on the reports of experts who stated that the purpose of the tubes could be more satisfactorily accomplished by the use of surface motor transportation.

As a result of this action by the President, the mail tubes which connect the post offices and railroad terminals and the main offices with branch stations in the cities named will cease operation on July 1 unless arrangements are made in individual cases to continue their use temporarily while changes in the distribution system can be effected.

The new plan will call for a much extended use of motor trucks, and the number in the service of the Government in post office work will consequently have to be increased materially.

Provision was made in the vetoed measure for a sufficient number of motor trucks to take care of the additional burden which would be imposed upon surface transportation with the discontinuance of the use of the mail tubes, and this clause of course remained in the new bill eliminating the use of the tubes, which was immediately put through after the President had vetoed the original one.

In his veto message President Wilson said:

"At the time that they (the pneumatic tubes) were installed, they may have had some value as a postal facility, but that was before the volume of mail had reached the enormous proportions which it has to-day, and before the development of the use of motor vehicles. These developments have made the tubes practically obsolete, quite unnecessary, and, in fact, a hindrance to the efficient operation of the postal service. . . . The Post Office Department has found it necessary, because of the unreliability and the inefficiency of the tubes, to divert a large quantity of mail formerly dispatched by their use to autos, wherever close connections are required. It has been found that late closings of the mails can be accomplished, and a closer connection assured by this means. I am informed that this is true even in the congested sections of New York City.

"I am informed that during the last 10 years many efforts have been made to extend the present system of pneumatic tubes, but that these extensions have been invariably advised against by the departmental commissions of the

postal experts, who investigated the matter, and that the reports of these experts invariably called attention to the development of the automobile as a factor which would have to be considered at the close of the present rental contracts."

### Manternach Heads American Welding

CLEVELAND, July 1—J. C. Manternach has been elected president and general manager of the American Welding & Mfg. Co., Warren, Ohio, which was formed early this year, with \$200,000 capital. Other officers are: Vice-president and general superintendent, C. W. Gressle, up to June 1 last and for more than 20 years connected with the Standard Welding Co. and later the Standard Parts Co.; treasurer, Dan A. Gieger, president of the Western Reserve National Bank; secretary and counsel, F. D. Templeton; master mechanic, J. L. Greer, formerly of the Trumbull Steel Co.; foreman of base and band department, Charles G. Smith, who held a similar position with the Standard Welding Co. The first unit of the company's plant, consisting of a one-story brick and steel structure, 100 x 260, is nearing completion, and it is planned to have the plant in full operation by Sept. 1. The company will produce S. A. E. bands, bases for solid tires, gear and chuck ring blanks, bands and wheels for tractors and steel tires for government artillery and escort wagons. The initial capacity will be about 500 base bands and 1000 S. A. E. bands per day. This will be considerably increased. Mr. Manternach has been manager of the rim and tube division of the Standard Parts Co., Cleveland, which position he left July 1, after having served the company for 8 years.

### Production of Spruce and Douglas Fir

WASHINGTON, June 28—According to what are called "preliminary final figures" on 1917 lumber production, just issued by the Forest Service of the U. S. Department of Agriculture, the reported production of Douglas fir last year was 5,327,720 thousand feet. This was 96 per cent of the computed production. The reported production of spruce was 975,913 thousand feet, as against a computed production of 1,125,000 thousand feet. The reported production in this case was only 86 per cent of the computed.

Incidentally it may be mentioned that the total lumber cut for the country for 1917 was approximately 10 per cent less than the production in 1916. This is attributed principally to the largely decreased private building operations, the scarcity of labor in connection with small operations, transportation difficulties, curtailment of demand on the part of wood using industries, and a more or less general dislocation of lumber distribution through ordinary channels of trade. A considerable portion of the total quantity produced was utilized in meeting the exceptional demand for Government construction and other war emergency projects, including ship material.

## Maximum Prices for Lumber Set

### Government Price Fixing Committee Establishes Figures for Fir and Pine

WASHINGTON, D. C., June 28—Maximum prices for two classes of lumber, fir and yellow pine, have recently been determined by a price fixing committee appointed by the President. The establishment of maximum prices on fir is of considerable interest to the aircraft industry, inasmuch as it has recently been found that Douglas fir is a satisfactory substitute for spruce in the manufacture of aircraft.

The action of the price-fixing committee was taken after consultation with loggers and lumber manufacturers of the Pacific Northwest, and of the South respectively. The price of fir lumber for aircraft use is to remain the same as now in effect. The price of fir ship timbers to the Emergency Fleet Corporation is to remain the same as that determined upon by the price-fixing committee on March 18, 1918.

Prices of all other items of fir lumber are to be based on the West Coast price list of May 1, 1915, plus additions on certain items enumerated on a discount sheet issued on Feb. 15, 1918.

### Prices Apply to All Mill Purchases

In an explanatory note accompanying the announcement of the new prices, by the Bureau of Public Information, it is stated that Douglas fir lumber prices apply on lumber manufactured in the Pacific Northwest, and represent an average increase of approximately \$2.75 per thousand board feet over the former list of prices for Douglas fir sold to the Government. The prices as now established are f.o.b. mill and apply to all purchases of Douglas fir for mill shipment.

The yellow pine prices apply on lumber manufactured in the southern states enumerated in the ruling. These prices represent an average increase of approximately \$4.80 per thousand board feet over the former Government list. The prices now established for yellow pine are likewise f.o.b. mill and apply to all purchases of yellow pine for mill shipment. Mill prices charged to the commercial trade for yellow pine prior to the date of the new ruling averaged considerably higher than the price fixed for Government purchases. This new ruling will not result in any higher prices than were formerly paid by the commercial trade for yellow pine, although it does mean a higher price for the Government. In the case of Douglas fir the new prices will result in a very slight, if any, average advance to the commercial trade.

### Ford Tractor Increases Capital

Henry Ford & Son, Dearborn, Mich., have increased their capital stock from \$1,000,000 to \$5,000,000.

## For Efficient Use of Freight Cars

### Government Issues Regulations for Proper Loading of Cars and Routing

WASHINGTON, June 27.—To utilize freight cars to the maximum the United States Railroad Administration has issued instructions as follows:

1. Consignments may be made for the same or for separate destinations. If for 2 or more destinations, intervening consignments must be to agency stations directly intermediate to the final destination.

2. Each consignment must be properly marked, showing consignee and destination, and loaded in manner best calculated to facilitate the unloading of each consignment with the least possibility of confusion, error, loss, or damage.

#### Bills of Lading and Waybills

3. Bills of lading and separate waybills must be made so as to distinguish each consignment as if loaded in a separate car. Waybills must plainly indicate that car contains 2 or more separate shipments and should be plainly indorsed "car contains more than one load, stop at ——— for partial unloading."

4. No diversion or change of destination or reconsigning in transit will be allowed, except where, under published rules, it may be in the same direction and over the same route as in the initial shipments after previous shipments have been unloaded. Movement to final destination will not be considered a reconsigning.

5. Switching or lighterage charges, if any, will be assessed for delivery at each destination, according to current switching tariffs. No switching or lighterage charge will be made against shipper or consignee for return of car to carrier at one destination for its continued journey beyond. The inbound carrier will absorb such charge, if any.

#### Agent to Supervise Unloading

6. Agent must supervise unloading and make careful check on quantity and condition of consignment for his station. He must see to it that load remaining in car is rearranged, if necessary, to protect it from damage. He must note on waybill that part of load, for his station, has been removed. He must see that car is promptly reported for movement to next destination.

7. When shipments are for the same destination, notice of arrival and demurrage will be handled as follows:

(A) Where two or more consignments take bulk track delivery all consignees will be promptly notified of arrival of car, that simultaneous unloading may be accomplished.

#### Payment of Demurrage

Consignees responsible for detaining car beyond free period must pay the demurrage charge. In the event that more than one consignee fails to remove contents within free period, demurrage will be collected pro rata.

(B) Where one consignee takes bulk track delivery and another private track delivery, each transaction will be independent of the other and demurrage will be charged accordingly.

8. Double or triple loading of consignments billed "shipper's order" will not be permitted unless the name and address of the party

*Type of track-laying artillery tractor which is being produced in France at the plant of the Schneider company*

or firm to be notified are shown on the original shipping instructions and the location of such party or firm is at the billed destination of the consignment.

#### Cadillac to Continue Present Type

DETROIT, June 29.—The Cadillac Motor Car Co. will continue its present type of chassis and body styles this year.

#### Ryan's Office Moved

WASHINGTON, June 27.—The office of John D. Ryan, Director of Aircraft Production and chairman of the Aircraft Board, was moved from the Munsey Bldg. to Wing 8, second floor, Building "D," Fourth Street and Missouri Avenue, N. W.

The Aircraft Board has been assigned offices in the Fourth Street wing of the same building. The Bureau of Aircraft Production is now located in the Fourth Street end. The removal of the offices of the Director of Military Aeronautics to the Sixth Street or western end of Building "D" brings the two main branches of the Army Air Service under one roof.

The Washington office of the Aerial Mail Pilots and the Washington Aviation Examining Board are also now located in the Sixth Street end of this building. Offices have also been assigned to the British, French and Italian Aviation Missions in the same section of the building.

#### Parts Sent as Baggage

DETROIT, June 29.—Because of the inability to get all the required material from the east, much of which is sent by express, the Cadillac Motor Car Co. has found it advisable to send a number of men from its purchasing department to bring back the desired parts. These men obtain the parts and pack them into trunks and return with them, marking the trunks as baggage. Only small parts, such as hinges, door handles and accessories, can be carried in this way. The method is expensive, but was the only way the company could secure the needed parts.

## All Australian Zinc For England

### Great Britain Contracts for Entire Output of Concentrates —Nine-Year Period

WASHINGTON, June 27.—The Australian Government has contracted to sell to the British Government the whole output of zinc concentrates in Australia for the period of the war and 10 years thereafter. On his previous visit to London the Prime Minister contracted for the sale to the Imperial Government of 100,000 tons of zinc concentrates and 45,000 tons of electrolytic zinc and spelter for 10 years.

The new arrangement contemplates the British Government taking the stocks of zinc concentrates on hand Dec. 31, 1917, less a definite percentage reserve, and thereafter 250,000 tons per annum for the period of the war, and 300,000 tons annually for the 9 following years.

Provision is also made for supplying the requirements of the Australian zinc refining works and the fulfilling of Japanese contracts during the period covered by the British contract. It is also hoped to extend the contract to take in copper and lead. Under normal conditions the Australian output of zinc concentrates, averaging from 46 to 48 per cent zinc, is about 400,000 tons a year.

#### Hayes to Handle Fender Sales

DETROIT, June 29.—The Hayes Mfg. Co. will handle the sale of the Hayes crown fenders for Ford cars and Hayes electric light bulb cases, which were formerly handled by the Onguard Auto Necessities Co., New York. The personnel of the Onguard company remains unchanged.

#### G. M. C. Moves Patent Department

DETROIT, June 26.—The General Motors Corp. will move its patent department from Detroit to 1764 Broadway, New York City, about July 1.

*View of the sleeping car for war uses developed by two American Red Cross officers. Note position of the berths*

## Design Sleeping Car For War

American Red Cross Officers Develop Two-Berth Machine on Renault Chassis

By W. F. BRADLEY

PARIS, June 8—One of the minor but at the same time serious problems to be faced by all military men in the zone of advance is that of sleeping accommodation. For several miles back of the lines towns and villages are so packed with troops that the most meager accommodation has to be accepted with gratitude. In France it is the custom for a special traffic regulating committee to make a census of all available accommodations in the zone through which troops will have to pass. Every house, every shed and every building is inspected, and a board attached to the walls showing how many officers, men and horses can be accommodated in each.

This means that when troops enter a town they know exactly how many of their number can be lodged in each and every building, and unless that number of troops is already in possession they have only to take up their quarters.

The automobile services, by reason of the fact that they are always on the move, are most interested in these general arrangements and are most frequently obliged to accept any makeshift quarters which may present themselves. Some truck drivers, knowing from experience that the quarters officially allotted to them may be anything but desirable, have made arrangements to transform their vehicles into bedrooms by the use of hammocks slung from the bows. Except in cold weather, fairly comfortable quarters are secured in this way.

Two American Red Cross officers, who

have had sufficient experience with conditions in France to realize the precariousness of relying on sleeping accommodation in permanent buildings, have had designed a car which makes them independent of the billeting officers.

The vehicle, an illustration of which is published, is a 35-hp. Renault with a special sleeping car body built on it. Down the left-hand side are two berths, consisting of a frame with adjustable headrest and mattress. These berths are carried on rails and are spring-mounted with a view to comfort when the vehicle is in motion. The two berths can be pulled out like stretchers and the supports for the rails can be demounted in a few minutes, leaving the interior of the car absolutely free.

On the right-hand side is a wardrobe and washing apparatus. There is a spacious central alleyway leading into a forward compartment just behind the driver's seat. This front compartment forms an office or smoking room, and admission to it is by means of side doors.

The car is equipped with electric lighting and is mounted on Michelin detachable steel disk wheels, those at the rear

being duals. This is one of the most comfortable and luxurious automobile sleeping cars in use on the front in France.

### Michigan Divided Into 13 Districts for War Work

DETROIT, June 29.—The lower part of Michigan has been organized for general work under the direction of the War Industries Board. Thirteen districts of the regional industrial commission were named and leaders put in charge of the work in each division. These districts will work under the general supervision of Allan A. Templeton.

Every industry in the State of Michigan comes under the general direction of the commission, whose main duty will be to facilitate the production of war material under the general direction of the War Industries Board. One of the main objects of the commission will be to obtain war contracts for the companies able to handle them. As soon as information is obtained about companies which can take additional munition contracts the commission will endeavor to place contracts with them.

### Copper Price May Be Increased

WASHINGTON, June 29—There is a strong feeling among copper producers that the War Industries Board, through its price-fixing committee, should increase the price of copper from 23½ cents a pound to 25 cents. The chief reason for asking for an increased price is that the new freight rate, it is estimated, will add a full cent to the cost of production.

The next conference between the Government and company representatives is to be held on Aug. 7 to consider the price, which will extend from Aug. 15. It is believed that before the former date a preliminary conference will be held either in New York or Washington.

### Philadelphia Office for Edison Battery

PHILADELPHIA, June 29—The Edison Storage Battery Co., Orange, N. J., has opened a sales office here in the Land Title Bldg. J. A. Hurst, sales engineer of the company, is in charge.

*External appearance of the Red Cross sleeping car which has been built on a Renault chassis*

## Sibley Joins Packard Co.'s Advertising Staff

Hi Sibley, formerly advertising manager of the Republic Motor Truck Co., Alma, Mich., has joined the advertising staff of the Packard Motor Car Co., Detroit.

R. J. Price, sales manager for the Highway Tractor Co., Indianapolis, has resigned to become zone manager in the southeast for the Heath-Duplex department of the McCord Mfg. Co., Detroit.

C. W. Zaughop, formerly eastern district manager of the Rainier Motor Truck Co., has joined the wholesale sales force of the Hurlburt Motor Truck Co., New York. He will cover Pennsylvania and Ohio territory.

Louis W. Cossey has been appointed sales representative of the Lane Motor Truck Co., Kalamazoo, Mich., for western Massachusetts and New York. He was formerly in charge of the International Motor Company's Albany branch.

T. L. Loose, formerly with the Hendee Mfg. Co., Springfield, Mass., has been appointed manager of the Canton Spring & Axle plants of the Standard Parts Co., succeeding J. B. Childe. The latter will go to the general offices in Cleveland.

F. F. Grimmelsman, formerly assistant manager of the Hess-Pontiac Co., has been appointed manager of the Perfection Spring plant of the Standard Parts Co., Cleveland.

W. L. Woodward, formerly assistant manager of the rim and tube plant of the Standard Parts Co., Cleveland, has been promoted to the managership, succeeding J. C. Manternach, resigned.

Ralph A. D. Preston, who has been in charge of the flying field of the Goodyear Tire & Rubber Co., near Akron, Ohio, where instruction in balloon service is given to student officers of the army and navy, has received his commission as lieutenant, senior grade, in the United States Naval Reserve Flying Corps. He is stationed at Washington, where he is in charge of repairs on navy airships.

William A. Scharon, formerly with the advertising departments of the Packard Motor Car Co. and the Timken-Detroit Axle Co., has been appointed advertising manager of the Hyatt Roller Bearing Co., tractor bearings division, Chicago.

K. B. Howard has been appointed a director of the Stutz Motor Car Co., Indianapolis, to fill a vacancy on the board.

D. Kiefer, engineer in charge of the ordnance division at the Harroun Motors Corp., Wayne, Mich., has resigned to join the navy.

J. M. Dine, for the past 5 years manager of the Omaha branch of the Goodyear Tire & Rubber Co., has been ap-

## Men of the Industry

*Changes in Personnel and  
Position*

pointed assistant manager of the Chicago branch of the company. C. A. Cramer, of Cedar Rapids, Ia., succeeds Mr. Dine as manager of the Omaha branch.

K. R. Jacoby, formerly assistant sales manager of Willys-Overland, Inc., has been promoted to the position of assistant to First Vice-President C. A. Earl.

J. H. W. Mackie has been appointed sales manager of the Saxon Motor Car Co. He was appointed assistant sales manager in February.

G. M. Evans, formerly treasurer of the Menominee Motor Truck Co., Menominee, Mich., has received the commission of captain in the Ordnance Department.

C. J. Welch, for 5 years manager of the truck tire department of the United States Tire Co., New York, has been promoted to the position of assistant sales manager of the organization.

Theodore H. Harvey, general manager and assistant secretary of the Pelton Steel Co., Milwaukee, since its organization 3 years ago, has resigned to accept the position of general manager of the Ohio Steel Foundry Co., Springfield, Ohio, effective July 1. William H. Schuchardt, vice-president and secretary of the Pelton company, has assumed the duties of general manager and will devote his entire time to the concern.

T. O. Kellogg, general manager of the Overland Wausau Co., Wausau, Wis., distributor of the Overland and Willys-Knight, has been transferred to the same position in the Overland Madison Co., Madison, Wis., distributor in the state capital territory, embracing all of southwestern Wisconsin.

### Capital Increases

The K. & M. Brass & Aluminum Castings Co., Cleveland, has increased its capital from \$10,000 to \$100,000.

The American Twist Drill Co., Detroit, has increased its capital stock from \$100,000 to \$200,000.

The Detroit Gear & Machine Co., Detroit, has increased its capitalization from \$500,000 to \$700,000.

The Ferro Stamping & Mfg. Co., Detroit, has increased its capitalization from \$25,000 to \$40,000.

## Hayes Plant Manager For Hess-Pontiac Axle

Lawrence Hayes has been appointed factory superintendent and assistant plant manager of the Hess-Pontiac Spring & Axle Co., Pontiac, Mich., having been transferred from the Perfection Spring division of the Standard Parts Co., Cleveland, where he was superintendent. Previous to this he was superintendent of the Cincinnati & Hammond Spring Co., Cincinnati, and D. W. Shuler & Sons, Amsterdam, N. Y.

George H. Bishop, for sixteen years connected with the Eclipse works of Fairbanks, Morse & Co. at Beloit, Wis., to-day resigned to accept charge of the general organization and system work of the Wright-Martin Aircraft Corp., with works at New Brunswick, N. J.; Long Island City, N. Y., and other eastern cities.

Howard Cody, for the past several years sales manager for the Frank O. Renstrom Co., San Francisco, Premier, Grant, Bethlehem and Atterbury distributor has been placed in charge of wholesale sales. He is succeeded by E. W. Papert.

H. G. Wedler of the Emil Grossman Mfg. Co., Brooklyn, has joined the colors and is in the mechanical repair shops, Unit 305, Camp Jesup, Atlanta, Ga.

### Record Pennsylvania Registration

PHILADELPHIA, June 29—It is expected that fully 350,000 Pennsylvania license tags will be used this year, as the department at Harrisburg is issuing No. 325,000. The order for 1919 will be the biggest ever issued—for 400,000, to be of black enamel with numbers in red and a space for the manufacturer's number. They will be similar in general style to those now in use.

### Ohio Has 380,000 Cars

COLUMBUS, O., July 1—The Ohio Automobile Department up to July 1 has issued approximately 380,000 registrations for gasoline cars in Ohio as compared with 347,542 registrations for the whole of 1917. Electrics were registered up to July 1 to the number of 4400 as compared with 4510 during last year, and dealers and manufacturers to the number of 32,000 were registered to the middle of the year compared with 34,078 for last year.

### Truck Converter from Loganville

MILWAUKEE, July 1—Leicher Bros., Loganville, near Prairie du Sac, Wis., have undertaken the manufacture of a new type of truck chassis for application to used passenger cars and plan a large production. The Leicher shops are being enlarged and considerable new equipment installed to handle the growing business, which comes from all sections of Wisconsin and eastern Minnesota.

## Government to Train Women Health Officers

WASHINGTON, June 29—Women health officers, whose duty will be to see that the thousands of women workers in munitions plants are kept healthy and their output of war materials thus maintained at the peak of production, are to be trained under the direction of the Women's Division of the Industrial Service Section of the Army Ordnance Department.

An eight weeks' course of study for a limited number of carefully selected women health officers started to-day at Mount Holyoke College, South Hadley, Mass. The course will be given under the general direction of Dr. Kristine Mann, Health Supervisor of the Women's Branch of the Ordnance Department. The women who are to take the course are college graduates, or women of equivalent technical education. Almost all

have had experience in dealing with working women. The first requirement for admission to the course has been perfect health, and only those have been selected who will inspire wholesome living among the munitions workers.

### G. M. C. Trucks for Medical Corps

WASHINGTON, June 29—One and one-half-ton G. M. C. trucks equipped with special bodies made by the H. M. Babcock Co. will be used by the Medical Corps of the United States Army for mobile X-ray equipment. Each truck will carry a complete X-ray outfit with a specially designed collapsible X-ray table. A stationary gas engine is included in the equipment and generates the electrical power for the X-ray. The sides of the truck body can be converted into tables, on which the patients can be treated. A demonstration of this truck and X-ray table was successfully made here before several medical officers.

## Find Brisk Demand for All Closed Car Types

TOLEDO, June 27—The demand for closed cars is greater than at any previous time, according to the Willys-Overland, Inc., and the proportion of closed car sales as compared with sales of open models shows a remarkable increase. More Willys-Overland closed cars have been sold since Jan. 1 this year than the total sales of all closed cars, excepting only the coupe types, in all the previous years the company has been in business. At the present time three models of closed cars are available for delivery: Overland Model 90 sedan and model 85-six coupe; Willys-Knight model 88-four coupe. Production plans for the balance of this year also provide for other models. These include the Willys-Knight model 88-four sedan and limousine, and the model 88-eight sedan, limousine and coupe.

## The Tractor Demonstration at the S. A. E. Meeting in Dayton

*During the S. A. E. summer meeting there was quite a demonstration of farm tractors, the Fordson, Best, Cleveland, Case and Parrett being put through their paces for the benefit of the visiting engineers. Below is the Parrett and above is the Best; the others are easily recognizable*

## Premier Rubber To Make Insulation Material Line

DAYTON, OHIO, June 29—The Premier Rubber & Insulation Co. has been organized for the manufacture of rubber insulation used for airplane and automobile parts. A plant has been erected here and is already in operation. The company was founded by A. Huetter, for many years superintendent of the Boonton Rubber Mfg. Co., Boonton, N. J., and who is now vice-president and general manager of the Premier organization.

### Buckeye Brass Adds to Plant

CLEVELAND, June 26—The Buckeye Brass & Mfg. Co. has purchased the plant and part of the tool equipment of the Cleveland Pneumatic Tool Co. The former company was organized 8 years ago and has outgrown its present plant.

### Smith & Hemenway Adds

IRVINGTON, N. J., June 29—The Smith & Hemenway Co., Inc., is erecting an addition to its plant. This will be used for the manufacture of Red Devil tools ordered by the Government.

### Anderson Has New Building

DETROIT, June 27—The Anderson Electric Car Co. announces the completion of its new building, 300 by 150, which is to be used for the assembling of ambulances for the Government.

### Combine Boston Maxwell and Chalmers

BOSTON, June 30—One of the biggest deals in combining two forces was announced to-day when the C. E. Fay Co. that handles the Maxwell line joined with the Chalmers Motors Co. of New England. The plan had been under contemplation for some time. Mr. Fay heads the company as president, Francis P. Allen, manager of the Chalmers, is vice-president, and Allan M. Fay, a son of the president, is treasurer.

### Donovan Enters Truck Business

BOSTON, MASS., June 30—Joseph S. Donovan, who conducts the Studebaker agency in Boston and vicinity, has entered the truck business, too. He has taken on the Sanford line for eastern Massachusetts. Frank E. Wing, who has handled the Marmon for many years exclusively, has been considering adding a truck line to his business, and has had conferences with a couple of well known makers.

### Dividends Declared

The Curtiss Aeroplane & Motor Corp. has declared a regular semi-annual dividend of 3½ per cent on preferred stock, payable July 15 to holders of record July 2.

A quarterly dividend of 1¼ per cent on the preferred stock of the Mason Tire & Rubber Co., Kent, Ohio, has been declared, payable July 1 to stockholders of record at close of business June 15.

## Current News of Factories

*Notes of New Plants—Old  
Ones Enlarged*

### Recent Incorporations

MILWAUKEE, WIS.—Acme Motor Parts Corporation; capital stock, \$25,000; to manufacture and deal in motor car, truck and tractor parts and accessories; incorporators, William S. Smulski, Joseph Mietus and William P. Doucette.

MILWAUKEE, WIS.—North Milwaukee Chemical Works; capital stock, \$30,000; to manufacture and refine chemicals, etc.; incorporators, John Hauser, Charles A. Schulz and Joseph M. Thomas.

### Baltimore Branch for Moline

BALTIMORE, July 1—The Moline (Ill.) Plow & Tractor Co. has opened a branch house in Baltimore to take care of the business on the Atlantic coast territory. The branch house has been organized and incorporated under the name of the Eastern Moline Plow & Tractor Co., the same as the branch at Bloomington, Ill.

### Corcoran to Increase Capacity

CINCINNATI, June 27—The Corcoran Mfg. Co. has purchased the former plant of the Knabe Piano Co. and will now be enabled to largely increase its production of radiators.

### Will Market K. A. L. Products

GRAND RAPIDS, June 28—The Furniture City Laboratories was recently organized for the purpose of manufacturing and marketing K. A. L. products throughout this territory. The line which they will produce includes body polishes for automobiles, hood and fender dressing, carbon remover and oil and greases. John F. Healy is manager of the company.

### Harroun Shipping Shells

WAYNE, MICH., June 28—The first unit of the shell department of the Harroun Motors Corp. is in operation, giving employment to about 300 people. There will be three more units in operation as fast as the machinery can be installed. The daily car production of nearly 200 per week is being maintained.

### Another Ford Plant for War

LOUISVILLE, July 1—The Louisville assembly plant of the Ford Motor Co. will be taken over by the Government for war work next month. Manager C. S. Williams said that the factory will cease assembling cars to-day and will prepare to turn over the place to any department of the Government which calls for it.

## Olds Motor Works Will Produce Own Engines

LANSING, June 27—The Olds Motor Works is erecting a new building for the manufacture of engines for its car, which heretofore have been supplied by the Northway Motor Co., Detroit, one of the divisions of the General Motors Corp. The new building, which will be 500 by 240, and loading dock, 700 by 60, will cost \$600,000, and an additional \$500,000 will be spent in equipping it. Contract calls for completion of the new plant by Nov. 1, and operations will be started about Jan. 1, when from 1500 to 2000 additional employees, both men and women, will be placed on the pay roll. Plans call for separate locker rooms for each sex and rest rooms for the women. There will also be a convention lunch room where department heads may gather for meals.

### Bloomington Shops Organize

BLOOMINGTON, ILL., July 1—A strike of mechanics and helpers of Bloomington garages and repairshops was adjusted after the men had been out a week. The terms of the settlement fix 9 hours as a working day, overtime to be paid for at the rate of time and a half, including Sundays and all holidays.

Apprentices are subject to the same shop rules as mechanics. They must be between the ages of 16 and 21 and serve 4 years of 290 days per year before qualifying as mechanics. All competent mechanics with 4 or more years of actual repairshop experience will receive 55 cents per hour. Apprentices will receive 20 cents per hour and an increase of 2 cents per hour for every 6 months until 4 years have been served. Shop helpers will receive a minimum of 35 cents per hour. Floor men, washers and night men were given a 10 per cent increase in pay.

### Feltes Treasurer of Studebaker

SOUTH BEND, IND., July 1.—N. R. Feltes has been elected treasurer of the Studebaker Corp., succeeding Charles C. Hanch, who has been placed in charge of the Automotive Products Section of the War Industries Board. Mr. Feltes has served 8 years as assistant treasurer of the U. S. Rubber Co., one year as treasurer of the Lozier Motor Co. and for the past 4 years has been vice-president and general manager of the Ames-Holden-McCready, Ltd., Montreal.

### F. T. C. Finds Huge Profits

*(Continued from page 33)*

refineries operated for the sake of the gasoline almost exclusively, and fuel oil was commonly sold at a loss, but now fuel oil is a very profitable product.

"The foregoing table will show the percentage of net earnings on investment for a series of years. The earnings for 1918 are estimated on the basis of the second six months of 1917 or the first quarter of 1918."

## Credits America With Tank Idea

NEW YORK, June 29—Major General E. D. Swinton of the British Army, in an address delivered at the Astor Theater for the benefit of the United States Tank Corps, said that the basic idea from which the British tanks were evolved was derived from American agricultural tractors of the creeper type.

The greatest secrecy was maintained in building the first lot of the machines. Even the name given to them was intentionally misleading. "They were called Tanks," said General Swinton, "so that not even the working men who were making them would know what they were manufacturing, and the rumor was circulated among the men that they were to be used in connection with the watering of our men in Egypt.

"Later, when it was time to punch holes in their sides for the guns, another story had to be invented. It was then rumored that they were snow ploughs to be used in Russia, and to carry out this deception each tank was stencilled with a Petrograd address, and when the tanks were finally shipped it was generally believed that they were going to Petrograd.

"In the final days of the construction of the tanks, 700 sentries, in three cordons, were thrown around the field in which the tanks stood. Matters were so arranged that the sentries of the outside cordon were not even aware of what was going on inside. It was shortly before the first of the tanks was shipped to France, in September, 1915, that a Zeppelin hovered over the tanks one night. The Zepp, however, came accidentally, and as they did not throw a searchlight to the earth the secret was never discovered."

## Housing Provisions Determined

WASHINGTON, June 29—All houses constructed for war workers by the Government will remain under the control of the United States until after the war. In so far as possible, all housing accommodations will be of a permanent character excepting where they are constructed in communities not likely to continue after the war. Loans will be advanced for the erection of dormitories to responsible corporations and associations not organized for profit. These arrangements for housing war workers have just been approved by Secretary of Labor Wilson and Director of Industrial Housing and Transportation Otto M. Eidlitz.

A management division is to be organized, which will undertake the manage-

ment of government erected properties, and a division of existent housing will deal with the question of utilizing housing and boarding facilities of each community to reduce government housing to the lowest possible minimum.

In fixing the rentals for government constructed houses the following factors will have to be taken into account:

1. Fixed Charges.  
Interest on investment.  
Insurance.
2. Reserves for upkeep of rented houses.  
Repairs.  
Renovating and redecorating.
3. Reserve for loss in case of non-occupancy.
4. Overhead expenses of administration.
5. Depreciation.

## To Reconstruct Belgian Industry

PARIS, FRANCE, June 29—An organization has been started to help reconstruct Belgian industry and trade by furnishing tools and necessary raw materials for every possible industry. This society, which is called "Comptoir National pour la Reprise de l'Activite Economique en Belgique," and which is working with the co-operation and under the control of the Belgian government, is endeavoring not only to reconstruct the industries, but also to help the people of Belgium by enabling them to work in the reconstructed shops. The organization is appealing to American manufacturers of materials for the construction of buildings, leathers, textiles, farm implements, chemical products, wood machines, electrical materials, motor cars, trucks, oils and greases, for catalogs and price lists to facilitate it in the placing of orders.

## Canadian Settlers May Import Vehicles

OTTAWA, CANADA, June 29—Machines for agricultural purposes, and vehicles and implements moved by mechanical power may be imported free of duty by a settler, provided he has owned it 6 months before his removal to Canada. The machine, however, may not be sold or disposed of without payment of duty before it has been in actual use in Canada for 12 months.

## Grace Motors Takes on Sterling for Canada

MILWAUKEE, June 29—The Grace Motors, Ltd., with headquarters in Toronto, and branches in several Canadian cities, has been appointed Canadian distributor of the Sterling truck.

## No Quad Royalties

KENOSHA, WIS., June 29—There has been much speculation concerning the manufacturing arrangements of the Nash Quad for military purposes, by which several organizations, namely, Hudson, Paige and National, are each building 2000 Quads for military use. C. W. Nash, president of the Nash Motors Co., has given to the United States Government the right to build the Nash Quad without royalty in any factories and in any quantities necessary for the period of the war. In addition to this the Nash company has furnished, free of cost, to different concerns manufacturing the Quads, the necessary working blue prints and is furnishing all the information by way of revisions to these blue prints without cost. G. W. Smith, who has been connected with the Nash engineering department, is giving all of his time assisting these companies in the manufacture of the Quads. It is expected that all three companies will be in production by July and the 2000 trucks from each should be completed soon after the first of the year.

Several outside concerns are assisting in the manufacture of parts for these trucks. Axles are being manufactured by Timken, Columbia and Salisbury. Transmissions are being manufactured by the Brown-Lipe and Haynes companies. Engines are being manufactured by Buda and Haynes. The M & S type of differential is being manufactured by Brown-Lipe-Chapin and M & S Corp. Lavigne is manufacturing the steering gears.

## Offer Night Photography Invention

WASHINGTON, June 29—An Italian invention permitting photography by night has been submitted to the Department on Military Aeronautics of the Army. It is claimed that excellent pictures can be taken of enemy positions from airplanes, lying at low heights on moonlight nights, and that the invention can be fitted to moving picture cameras, permitting photography of actual fighting much of which takes place in the early morning hours.

## Fafnir Starts a Dragon

NEW BRITAIN, CONN., June 30—The Fafnir Bearing Co. has issued a house organ which is called "The Dragon." It is devoted to affairs of the Fafnir manufacturing organization, its buying clientele, and information relating to the products.

## Calendar

## RACING

July 4—Cincinnati, Cincinnati Speedway.  
July 4—Tacoma, Wash. Tacoma Speedway Assn.  
July 27—Chicago. Chicago Speedway.  
Aug. 2—Uniontown. Uniontown Speedway Assn.  
Aug. 10—Providence, R. I.  
Aug. 17—Sheepshead Bay.

Sept. 2—Uniontown. Uniontown Speedway Assn.  
Sept. 7—Chicago. Chicago Speedway.  
Sept. 21—Sheepshead Bay.  
Oct. 5—Cincinnati. Cincinnati Speedway.

## SHOWS

July 29-Aug. 4—Salina, Kan. National Tractor Demon-

stration. Auspices of National Implement and Vehicle Assn.

Sept. 23-28—Chicago. National Accessory Show for Fords. Coliseum.

Oct. 14-27—Dallas, Tex. Seventh Annual Texas Automobile Show. Texas State Fair.

## ENGINEERING

Sept. 2—Cripple Creek, Colo. American Institute of Mining Engineers.

Nov. 14-15—New York. Society of Naval Architects and Marine Engineers. Twenty-sixth general meeting. Engineering Societies Bldg., 29 West 39th Street.

# AUTOMOTIVE INDUSTRIES

## AUTOMOBILE

WEEKLY  
JULY 11, 1918

## Hudson Dealers and the Advantage They Have

Hudson dealers have a decided advantage in these times. They are established. They have built reputations in their communities.

The very fact that most Hudson dealers have concentrated their efforts during the past few years has strengthened their connection, not only with the factory, but with their customers. When others were taking on side lines, Hudson dealers were working for Hudson. It is co-operation of this sort that has made Hudson dealers prosperous and has made them the leaders in their localities.

Hudson has always demanded merchandising ability and now more than ever this quality is necessary for the present day automobile dealer.

**Hudson Motor Car Company**

**Detroit, Michigan**

# THE THREE DOMINANT ACCESSORIES OF THE SEASON

## UTILITY SURE-GRIP PEDALS FOR FORDS

**Price Only \$1.00 PER PAIR**

Transforms the small, smooth Clutch and Brake Ford pedals into standard size, comfortable pedals. The driver's foot absolutely cannot slip off the pedal. The heavy rubber pad and flange at the side prevent all possibility of a slip, even in rainy weather when the shoes are wet.

The Utility Sure-Grip Pedals also serve to easily distinguish the clutch and brake pedals from the reverse.

### One Dollar Prevents Accidents

By installing these pedals on Fords, drivers can absolutely prevent accidents due to the foot slipping off the pedal.

In crowded traffic a slip of the foot may mean jamming into a street car or the car ahead. One dollar will prevent this.

These pedals can be attached instantly—no holes to drill—no special tools required—one nut to tighten and the job is done. Made of high grade pressed steel beautifully finished in black baked enamel.

Absolutely guaranteed.

2 SECONDS AGO

AND NOW

## UTILITY DISAPPEARING TRUCK FOR FORDS

**Price \$32.50**

Once the Utility Disappearing Truck is installed it requires only 2 seconds to change from a Ford roadster to a half-ton truck. The truck is completely out of sight, telescoped under the original turtle back of the Ford. The car is not disfigured in any way—it looks just as it always did, with no hints of the truck when it is not in use.

### Hauls Any Half Ton Load

Can be completely installed by *anyone* with a hammer and wrench in one hour. Only four bolts used in attaching it. No rattle—no vibration. Will haul any load up to a half ton.

Made of heavy gauge steel finished in black baked enamel to match finish of car. Can be pulled out to the desired length. No bolts or rivets are used in its construction. It is acetylene welded throughout.

Makes a Ford the most *useful* car on the market.

**PRICE  
\$1.50**

## UTILITY UNIVERSAL RIM WRENCH

**ONE TOOL FITS EVERY NUT**

The UTILITY Universal Rim Wrench is built in only one size—yet it automatically fits every nut on every demountable rim. In the tool box of the motorist, in the stock or the shop of the garage or repairman, it is small enough to be always out of the way—except when you need it. Then it is always ready for use—a single tool that fits, holds, and turns any nut.

### One Tool For Every Nut

The new UTILITY Universal Rim Wrench is beautifully finished in nickel and black enamel. It is more compact and lighter, and built with practically unbreakable jaws. It is shortened to go into the tool box without folding, and is absolutely rigid in action—a stronger brace that cannot close up or slip while in use by the operator.

## Steel Shipments Can Be Made Without Priority Certificates

War Industries Board Reclassifies Consumers, Allowing Makers of Cars, Trucks and Tractors Sufficient Steel to Complete Present Production

### New Steel Arrangements

*Classification of steel consumers allows shipments to certain consumers without priority certificates or written approval from War Industries Board.*

*Jobbers in steel and steel products will be allowed to maintain and replenish stocks.*

*Consumers ordering not more than 5*

*tons of steel in the aggregate will secure delivery regardless of their classification.*

*Exports of steel and iron products will be supervised by War Industries Board. The steel and iron will not be shipped to the manufacturers for construction into products for export except by written approval.*

By Allen Sinsheimer

WASHINGTON, July 9—Shipments of steel and pig iron can now be made to certain consumers without priority certificates or written approval from the War Industries Board under a new classification plan just arranged.

The trend of the new scheme inaugurated by the Board marks a relaxation from the strict steel control it has supervised in the last 60 days. It appears that the forecasts made by the steel industry that the War Industries Board would learn that the Government does not require the entire steel output for war work are true. Apparently steel production is greatly in excess of Governmental steel requirements.

There are five classifications of consumers, including, according to unofficial version:

*Class AA, A and B*—Ships, including destroyers and submarine chasers; aircraft; munitions; fuel for military, naval and domestic consumption and for war factories.

*Class C*—Railroads and other necessary transportation equipment; public utilities serving war industries, army, navy and the civilian population; clothing for civilian population; fuel for food, clothing and like industries; tools, implements, utensils and equipment required directly or indirectly for food production, completion and preservation.

*Class D*—All industries and products not included in the above.

Making public the classification scheme, the Board declined the request of AUTOMOTIVE INDUSTRIES to outline either the above classifications or the posi-

tions of automotive products as told below, officially, but in interviews indicated that these classifications and positions would be approximately correct.

The positions of the automotive products under the new classification will be:

**Classes AA, A and B**—Airships; passenger cars for war purposes; trucks for war purposes; motorcycles for war purposes; military tractors.

**Class C**—Farm tractors; commercial trucks; passenger cars partly finished and requiring only a minimum of parts for completion; passenger car factories performing considerable war work where it is desirable to maintain that part of the organization making passenger cars; motorcycles.

**Class D**—Passenger cars not strictly for utilitarian purposes or not specified in the above classifications.

Priority certificates will be issued by the director of steel supply, War Industries Board, to classes AA, A and B, indicating that these are of the utmost importance and will receive first consideration.

Producers of steel and pig iron can ship these commodities to class C consumers without priority certificates or written approval. They are allowed by the War Industries Board's instructions to ship to class C consumers not only after priority certificates are filled, but at any time such deliveries do not interfere with the filling of priority certificates. It is anticipated that this arrangement will insure adequate steel supply to all class C consumers.

Orders not exceeding 5 tons in the aggregate for class D consumers can be filled by producers without written approval from the Board provided these shipments are reported monthly with a statement that the orders were filled in the public interest. Orders from class D consumers for more than 5 tons must first be approved by the War Industries Board.

#### Procedure for Manufacturers

The surest plan for all manufacturers to pursue, if not in classes AA, A or B, is to assume that they are in class C and apply for their full steel and pig-iron requirements from the producers on that basis. If they are unable to secure their needs through this plan or cannot find a producer or manufacturer who will accept the order, application for allotment should be made to the Director of Steel Supply and should be supported by strong evidence in writing that the public interest requires that such orders be placed and filled.

Purchasers of steel under class C rating should not apply to the War Industries Board so long as reasonably satisfactory delivery is secured. They should apply for their requirements only to the steel producers. Class D consumers should apply only to the producers and manufacturers of steel and pig iron, who will in turn, when the orders amount to more than 5 tons, mail such applications in duplicate to the War Industries Board for approval.

Discussing the classification of passenger cars it was said that all such applications for steel or pig iron when not in class C or higher will be considered on their respective merits. The extent of loss, the quantity of steel needed, the conversion possibili-

ties of the factory will be taken into consideration.

According to some officials of the War Industries Board a plan is now under consideration whereby steel will be supplied to all passenger car manufacturers under a license plan under which they will be allowed to make and sell passenger cars for solely utilitarian purposes. The plan is at this time very vague in the minds of those conceiving it.

They are considering some method by which the consumer would supply a certificate testifying to the uses planned for the car he desires to purchase. If some such plan can be successfully operated it is expected that the manufacture of the great bulk of passenger cars, which goes to the farmers, doctors, contractors and other businesses and professions, will be continued.

#### Requirements for Jobbers

Jobbers of farm tractors and similar commodities will be allowed to maintain and replenish their stocks, but must observe the essential minimum in placing orders. They must sign a pledge to prevent hoarding, and to sell their stocks only for essential uses. They must exact similar pledges from their customers. By meeting these conditions they will be assured prompt shipments by the makers and will be given priority ratings by the War Industries Board.

The jobbers dealing in plates, sheets, bars and shapes, structural shapes, farm implements, tubular products, wire and wire products, tin plates, heavy hardware, farm implements, mining tools, machinery and equipments, oil well supplies and similar products will operate under the following plan in the maintenance of their stocks:

Each jobber will file before the 5th of each month with the director of steel supply, War Industries Board, a certified statement covering shipments made during the preceding month. Forms will be furnished for the statements by the War Industries Board.

To the extent that such shipments fall within classes AA, A, B or C as defined above or by permits issued by the director of steel supply, the jobber will be entitled to rank with the manufacturer and secure priorities for the replacement of shipments so made, provided that the total tonnage ordered for replacement will not be in excess of the amount shipped during the previous month.

Manufacturers will be expected to scrutinize all orders from jobbers to guard against hoarding.

#### Must File Pledge

All orders placed in accord with the above rules will be rated as class B-4 and entitled to class B priority and precedence, providing the jobber placing the order has filed with the priorities committee and the director of a steel supply, War Industries Board, a pledge in writing as follows:

*"I do hereby pledge myself not to use or so far as lies within my power permit the use of any stocks now in or which may hereafter come into my possession or control, save*

"(1) for essential uses as that term may be defined from time to time by the priorities division of the War Industries Board, or

"(2) under permits in writing signed by the director of steel supply; that I will make no sale or delivery from such stocks to any customer or retailer before his filing with me a similar pledge in writing; and that I will use my utmost endeavor to prevent the hoarding of stocks and to insure that they be distributed solely for essential uses."

When this pledge has been once filed the jobber should certify this fact on each order when placed with the manufacturer. Manufacturers will not accept orders without such certification.

No applications for licenses to export iron or iron

and steel products should be made of the War Trade Board (except on direct orders of the U. S. Government and its Allies) unless the orders are (1) covered by priorities certificates Classes AA, A or B or (2) covered by a permit signed by the director of steel supply. This ruling does not indicate that the steel division of the War Industries Board has usurped the duties of the War Trade Board and will control all exports. It does mean that wherever an article or commodity which would ordinarily fall in class C for consumption in this country, such article or commodity will fall into class B if manufactured for export and the manufacturer will lose his preferential class C rights. Before he secures the steel for manufacture of an article of iron or of iron and steel for export, he must secure a permit from the director of steel supply just as if he were in class B.

# First American-Built Handley-Page Plane Launched

At Ceremony, Ryan Praises Work of His Predecessors, Howard Coffin and Colonel Deeds—Says Liberty Engine Is "Best Ever Built"

ELIZABETH, N. J., July 8—At the launching of the first Handley-Page bombing plane constructed in this country at the plant of the Standard Aircraft Corp., John D. Ryan, head of the Aircraft Production Board, paid a generous tribute to the work of his predecessors, undoubtedly meaning Howard E. Coffin and Col. Deeds, and pronounced the Liberty engine "the best and most powerful aeronautical engine ever built."

With regard to the work of those who had preceded him in charge of the Government's aircraft building program, Mr. Ryan said:

"Much good work has been done by my predecessors, and I am taking this opportunity to assure the people of the country that, in my opinion, there has been no such delay with the work or anything like such incapacity of those in charge as has been indicated in some of the criticism of the accomplishments, or lack of them, in production. A few facts will, I think, bear me out.

"In the fifteen months we have been at war here has been designed and put into production the Liberty engine, which is acknowledged by all of the Allies as a great performance and a distinct contri-

bution to the cause. As a powerful machine to drive heavy aircraft, it is undoubtedly as satisfactory as any engine produced by any nation on either side of the war. There were produced here in our workshops during the months of May and June just passed as many of these engines as Great Britain produced of all types of aeronautical engines in the entire year of 1915, at the close of which she had been seventeen months at war. Including other types of aircraft engines, there were more produced in our shops in the month of June than Great Britain

# Distribution of Truck Weights

## An Analysis of the Weights of Component Parts, Worked Out on a Percentage Basis, and Showing Variation of the Percentages with Truck Capacity

By P. M. Heldt

**A** STUDY of the distribution of weight among the components of a motor truck is of considerable interest. Heretofore we have not given very much attention to weight reduction in trucks, but if fuel and tires continue to increase in price it will assume a much greater importance in the future. As in other pieces of mechanism, the individual components of a truck should be nicely balanced against each other, so that each affords substantially the same degree of safety. The dimensions, and consequently the weight, of some parts are dependent upon the wear desired. In their case it is probably not correct to say that all should be designed for an equal life, as those parts which can be replaced quickly and at slight expense may well be made somewhat smaller, relatively, than others, the replacement of which is fraught with more difficulty and expense.

Motor truck components divide into two classes, one comprising all those which constitute a substantially fixed proportion of the weight of the complete truck, irrespective of the size or load capacity of the truck, and the other all those whose proportional weight varies with the capacity of the truck. In the following discussion the weight of the complete chassis, dry, is taken as 100 per cent.

### Engine Weight Proportions

It is generally known that large trucks carry a relatively smaller engine than small trucks. From the load capacity standpoint, the large truck has a higher weight efficiency, that is, the proportion of useful load to dead load moved is higher, and, besides, the larger truck is geared down more and runs at lower speeds, consequently it does not need so powerful an engine. One well-known truck manufacturer in the past equipped a complete line with a single engine, depending upon the higher gear ratio in the larger trucks to move the heavier loads. This, of course, is an extreme case. In general the piston displacement of truck engines may be represented by a curve concave toward the horizontal axis, the curve tending to become horizontal as the larger capacities are reached.

Data used in this article are from twenty-one models of trucks ranging in capacity from  $\frac{3}{4}$  ton to 5 tons. The data have been averaged, mean percentages being given where there appears to be no variation in the proportional weight with the capacity of the truck, and curves where there is such variation.

Frames appear to bear a substantially constant proportion to the total weight of the truck chassis, the figures obtained for the different trucks varying only within narrow limits. The average value is 10.6 per cent.

In springs there is a decided difference in the proportional weights at the ends of the list but nothing like uniformity of variation from one end to the other. This may possibly be due to the fact that small trucks are sometimes mounted on pneumatic tires and these

may require less range of spring action and consequently less weight of spring material. Taking only trucks above  $1\frac{1}{2}$  tons load capacity, the proportional weight of the springs is not affected by the size of the truck. In this class all four springs together weigh 8.16 per cent of total weight of the chassis dry, whereas the springs of the trucks of  $1\frac{1}{2}$  tons and under weigh on the average 6.77 per cent of the total. The front springs in each case weigh much less than the rear springs. For eight models the front and rear spring weights were given separately, and for these the front springs made up an average of 26.6 per cent of the total spring weight.

The proportional weight of front axles does not vary materially with the load capacity of the truck. The front axles on the larger trucks are slightly heavier in proportion than those on the smaller sized trucks. Thus, if we take the axles on the  $3\frac{1}{2}$  and 5 ton models only, their mean proportional weight is 3.6 per cent of the whole, whereas the mean proportional weight of front axles of trucks of less than  $3\frac{1}{2}$  tons capacity is 3.13 per cent. For all of the trucks on which data were obtained the mean is 3.28 per cent.

Rear axle weights show much the same characteristics as springs in that the percentage is materially smaller at the lower end of the load scale than at the upper, yet there is no steady increase from one end of the range to the other. Thus the average percentage for the three 1-ton models considered is 12.83, while that of the three  $1\frac{1}{2}$ -ton models is 15.82, which is more than that of three 5-ton models, viz., 15.49. It must be remembered, of course, that rear axle designs vary a great deal, both as to the form of drive employed and as to the design of the axle housing which makes up the greater part of the weight. The great majority of the trucks considered have worm drive, however. In the curve an attempt is made to average all the figures, and a gradual increase is shown.

### Steering Gear and Radiator Weights

Steering gear weights are proportional to chassis weights throughout. The lowest figure is 1.11, the highest 1.50 and the mean 1.37 per cent.

Radiators make up a smaller proportion of the weight of large than of small trucks. This is what might be expected, since the size of engines does not go up in proportion to truck capacity, while the size of the radiator must be roughly proportional to the size of the engine. The variation of the percentage weight is shown by one of the curves.

Engine proportional weight shows the most pronounced decline with an increase in truck capacity of all the large items considered. The one  $\frac{3}{4}$  ton truck listed has an engine weight equal to 17 per cent of the chassis weight, which is substantially the same figure as found in passenger cars. On the other hand one of the 5-ton trucks has an engine proportional weight of

Curves showing the relative proportional weights of various truck components and equipment for trucks of different capacities

8.77 per cent and the mean value for all four 5-ton models is 9.75 per cent. Variation of the proportional engine weight with load capacity is shown by a curve.

The friction clutch is not always a distinct part, and it is therefore hardly warranted to expect close agreement between proportional weights of this part on different trucks. For those trucks for which the clutch weights were given the mean percentage value is 1.40. There is apparently a slight decline in the percentage with an increase in the size of the trucks, but the values found are so irregular that it is difficult to see the nature of the variation.

Transmissions drop in proportional weight with an increase in truck capacity even more rapidly than engines. It is customary to use relatively heavy transmissions on motor trucks, for one reason because trucks are driven a good deal of the time on one of the lower gears and the gear wheels must be dimensioned for continuous service. Roughly, on a motor truck the transmission weighs about one-half as much as the engine. One of the curves shows the variation of proportional transmission weight with truck load capacity.

Front wheels, like the front axles on which they are mounted, show no perceptible variation in proportional weight with truck size. The average value for seventeen models is 7.35 per cent.

#### Rear Wheel Weights Vary Considerably

Naturally the total weight of a chassis is 100 per cent for both a large and a small truck, and as the percentage weight of a great many items, such as engine, transmission, radiator, fuel tank, etc., is less in the large truck than in the small one, there must be other items whose proportional weight is greater in a large truck. Chief among these is the rear wheels. As shown by the curve, the proportional weight of the two rear wheels with their brake drums, rims and tires is about twice as great in a 5-ton truck as in a 3/4-ton truck. One reason for this is that the capacity of the rear tires must be in direct proportion to the weight on them when the truck is loaded, and practically all of the load rests on the rear wheels. The front wheels are very little affected by the load and therefore the proportional weight of the front wheels does not vary with the truck capacity. If the load was proportional to chassis weight then the proportional weight of the rear wheels need not vary with truck capacity, but this is far from being the case. Using round

figures, a 1-ton truck weighs about 2 tons empty and when loaded may have 1 ton of dead load and 1 ton of useful load on the rear tires. A 5-ton truck, on the other hand, weighs only about 4 tons empty and when loaded may have 2 tons of dead load and 5 tons useful load on the rear tires. This brings out the reason why the rear tires must be proportioned in accordance with the load. The same applies to a certain extent to rear axles, as the load must be held up by the axle.

It might be thought that as the load has to be supported by the springs the proportional weight of the latter also should increase with the truck capacity. There is indeed a slight increase, as already shown, but this is nothing like as pronounced as the increase in the proportional weight of the rear wheels. One reason for this is that the necessary weight of springs depends on other factors besides the weight to be carried. The heavier trucks are slow speed vehicles and not as much spring compression under load needs to be allowed for as in a

(Continued on page 85)

Axle and wheel weights increase considerably with any increase in the capacity of the truck

# The Matter of Credit in Export Trade

## Soundness of the Short Term Principle Which American Exporters Advocate —Open Credit vs. Time Acceptances—Adapting Methods to Product, Market and Buyer

By W. E. Tarlton\*

**M**ANUFACTURERS anticipating a permanent export business must decide upon some definite policy regarding credit. As a rule, there are three points to consider:

1—The product—If it is non-competitive the exporter may dictate terms and prices; if not, he must be governed very largely in these particulars by what others are doing.

2—The market—The rules of the markets of the world have been long established and are not easily changed for the convenience of the seller.

3—The buyer—He will consider a cash transaction last. He probably will expect credit.

It has been said, and rightly, that if a manufacturer would export at all, he must handle his credits in an intelligent way and along lines not fundamentally different from those employed in dealing with domestic trade.

American exporters have been harangued by writers of various creeds and tongues, even American writers, for their rigidity of terms, and, in contrast with them, mention has been made of the liberality of Germany. We, of course, have to-day our own ideas as to the extent of Germany's liberality. England and other exporting countries have been extolled and their praises sung. We have been told of their philanthropy, of their enterprise, of their investments made for pioneering enterprises with no desire for return except as a benefit to their country as a whole, but all of this is quite misleading.

True enough, in the experience of American exporters, it has been found that in many instances long terms have been granted and liberal credits extended by foreign manufacturers in these various countries, but an analysis of the situation will invariably show that these long terms and liberal credits have been extended only after careful investigation and after applying the same general rules that should always govern the extension of credit of any character.

### Short Term Principle Fundamentally Sound

Even our so-called "American" cash terms are quite freely indulged in by our competitors in international trade, and more often than otherwise are demanded by them. Conservatism pervades the mind of every intelligent credit grantor, whether he learn it from an American business primer or from an English, French or Dutch. The short term principle which, I admit, is desired by every American manufacturer, is fundamentally sound, ideal, and, in fact, enviable, and the time is ripe for a forceful attitude toward short terms, especially in lines of quick turn-over possibilities, commodities, etc.

Up to the present time it has not been expedient nor necessary that we should place our goods in foreign fields on long terms or under a system of loose credit; in fact, it has not been necessary that we sell our goods to foreign countries at all except where it could be done on an extremely profitable basis, and long terms and long profit are not compatible unless they are accompanied by a mediator—long prices. Implicit faith in American business capacity and ingenuity prompts me to feel that we can and will overcome any and all competition, however, when once we have found it necessary to do so.

The manufacturing capacity of the United States has heretofore just about equalled our demand, but, of course, we are

beginning to realize that there will be surplus production so soon as the high peak loads toward which we have been so fast climbing is reached. It is only caution, therefore, that prompts those who have analyzed this situation to begin now to prepare for the struggle for commercial supremacy which will surely follow that for military supremacy now being waged. That we, as exporters, are willing to grant credit is an irrefutable fact.

One hundred and forty-one representative firms were asked the question: "Are you granting credit to concerns located in countries other than our own?" One hundred and ten replied affirmatively, thirty-one only were insisting upon cash in every instance. Our American firms are as able to extend credit, or better able, in fact, than any competitor we have. We have the financial strength, and when the propitious moment arrives and a reasonably substantial basis for credit can be shown, we are perfectly ready to extend the necessary credit.

Importers of our goods, however, must know or be taught, if they do not know, that merchandise on credit costs more, that short terms are economical, sound and safe; that long terms and the pernicious abuses of credit which have been prevalent in some countries, should be wiped out at this, the most opportune time of all history.

### Open Credit vs. Time Acceptances

Up to this time I have not attempted to differentiate between the term "open credit" and "time acceptances." Both are credit, one extremely hazardous, the other considerably less so. There are, of course, sound, honorable business men in every civilized country in the world and I, for one, deeply appreciate the truth of this, but these qualities are most loudly extolled by those whose close, first-hand knowledge and experience is not represented by many years of actual, open-credit relationship with merchants in foreign countries, and I mean it as no reflection upon these merchants when I warn against open credit. It is a policy only to be dealt with with eyes wide open and after a thorough investigation.

Open credit is based solely upon confidence. Confidence is the result of one's own or some one's else experience and should only be dealt in when you are familiar with the details of some such experience.

There will come times, in the experience of every exporter who does any volume to speak of, when he must extend open credit or lose profitable business, and in many cases, under any and all sorts of circumstances, and in most any country, some open credit can be extended with no more attending dangers than is average with any well-organized house, even though dealing exclusively with domestic trade.

We need badly further help from our enormously large financial institutions. They, at least some of them, have had the vision and are bending and lending every effort toward promoting the interests of American exporters. We need also serious study on the part of our legislature toward expansion of foreign trade interests, but, greater than all these, is the need that the mist of indifference and business apathy be removed from the eyes of our manufacturers that they may not only see the benefits that will accrue to them as individuals by a closer study of this vital issue, world's commerce, but that they may consider it a duty to interject their energies into it so that as a nation we may become a real factor.

\*Abstract of a paper presented before the National Foreign Trade Convention.

Fig. 1—Arrangement of cars for shipment on electric flat cars

## New Methods of Loading Freight Cars

Schemes Devised for Loading Cars on Other Than the Regulation Automobile Type—Continental Motors Has Improved Shipping Facilities

By C. J. Shower

THE scarcity of freight equipment has made it necessary for the traffic departments of all car manufacturers to use their ingenuity in devising schemes for loading cars in the most efficient manner. There was a shortage of all kinds of freight cars. If the manufacturer could not get the regular automobile cars he was obliged to accept anything he could get if he wanted to dispose of the accumulating stock. With the supply of box cars very small, manufacturers were thankful to obtain flat cars, gondolas or any other type of car that was available—even cattle cars were used in many instances.

The use of other equipment necessitated a change in loading facilities. A number of companies borrowed the wrecking equipment of a railroad. By running this alongside a gondola it was a very simple operation to lift the passenger cars into it by means of the crane.

The Cadillac Motor Car Co. built its own lifting device. With the aid of chain hoists the cars are lifted off the ground and when above the sides of the freight car are pushed over it and lowered. Fig. 5 illustrates this. After two cars are deposited within the body of the gondola another one can be set on top as illustrated in Fig. 3. The cars are lifted on two iron bars which are hooked to the chains at each end, Fig. 4. Fig. 5 shows a car suspended in the air ready to be moved over the gondola and lowered.

The method of loading gondolas by the Dort Motor Car Co. is somewhat different. Runs are built up to the gon-

dola and the cars are driven up on them. After two cars are thus placed upon the floor of the car, tracks of boards are made on top of them and another incline is built to connect with these tracks. Two more cars are then driven up and placed on boards above those on the floor, making a second tier of cars. Fig. 8 shows a car ready to start on the first incline, while the car in the distance has succeeded in climbing the second incline and is being fastened (Fig. 2).

Fig. 9 shows the method employed by the Olds Motor Works in loading flat cars. A rigid framework is built on a flat car, and boards placed at an angle of about 30 deg. form a track at each side upon which the cars may ride and be placed in position. It is possible to load four cars on a flat by this method; this is styled "end up" loading. Tarpaulins are thrown over the cars afterward

Fig. 2—Fastening the second layer of cars

Above: Fig. 3—The freight has just received the last of its quota. This gondola is carrying three cars; one is directly underneath the one that has just been placed and the corner of a coupe is seen immediately ahead. Upper right hand corner: Fig. 4—This illustrates the manner in which the car is lifted. On right: Fig. 5—The method of loading cars used by the Cadillac Motor Car Co., Detroit. A derrick is built to which the cars to be loaded are driven on the ground. One by one they are lifted with the aid of a chain hoist and swung into the gondola

Fig. 6—Shipping at the Continental Motors Corp. is all handled under cover. The finished motors are loaded in the same cars that have just been emptied of their loads of rough stock without moving the freight cars

Fig. 7—Four Oldsmobiles, with their bodies properly protected, on a flat car ready for shipment

Fig. 8—The way the Dort Motor Car Co., Flint, loads its cars

to give protection from the weather and to exclude dust and dirt.

Fig. 1 shows loading on electric flat car equipment. Two cars are driven upon the flat and a third is raised on its rear wheels with the front ones propped up on a standard over one of the cars.

A feature of interest in the construction of the addition of the Detroit plant of the Continental Motors Corp., besides the fact that all handling of material is done under cover, and therefore may be carried on regardless of weather conditions, is that the incoming material is delivered directly from the cars to the various points in the machine shop, where it is turned over directly to the machines. This eliminates the necessity of trucking of material from the rough stores to the manufacturing department.

A crane in the test house is used in taking up the finished motors and placing them on the shipping platform alongside the railroad track, where they are loaded directly in the same cars which just previously brought in rough stock. This arrangement greatly expedites the

Fig. 9—The method used by the Olds Motor Works in loading cars on end. The cars are driven up the inclined tracks at both sides and blocked

handling of material, and makes it unnecessary to move the freight cars from the point of unloading raw materials to the receiving of the finished product.

## New Pfalz Single-Seater Scout

Fast Plane-and-a-Half Type—Has Elliptic Section Body Covered with Three-Ply Wood and Carries a 160 Hp. Engine

ONE of the latest models of German aircraft to make its appearance on the battlefield is the Pfalz Scout, which is of the type that has come to be known as the plane and a half. This type is characterized by a large top plane and a smaller lower plane. In some of the previous models of this type, like the Albatross, two struts connect to the lower plane in a single point, but in this detail the Pfalz is different, there being a short horizontal distance piece between the lower ends of the two struts. The small lower plane is made with two spars instead of a single center spar, and is therefore a compromise between the single-spar type and the regular two-spar plane, in which the spars are placed the same distance apart as in the upper plane.

One feature of the Pfalz reminding one of the Albatross is that the upper wings are formed in a single piece, and are, of course, without any dihedral angle. The top planes are secured to struts sloping upward from the fuselage. A somewhat novel idea is embodied in the method of securing the lower planes to the body. At the point of attachment there is an inflexion in the

curvature of the body outline, the surface of the body swinging outward and gradually merging into the wing surface. That part of the body extending toward the wing may be regarded as a wing root.

The body or fuselage of the Pfalz is of elliptical section, deep and narrow. This has the advantage that both the engine and the pilot are practically entirely within the body, thus reducing the head resistance to a minimum. The narrowness of the body also minimizes interference with the pilot's view. Body construction is of the semi-monococque type, the body being covered by two thicknesses of three-ply wood put on diagonally in long, narrow strips, one strip crossing the other at an angle of about 90 deg. The tail planes are somewhat unusual in that their top surface is flat, while the lower surface is convex. Just what the object of this deviation from conventional practice is it would be hard to say.

The engine fitted to the Pfalz Scout is a 160-hp. Mercedes, and is very well housed in, only the upper ends of the cylinders projecting from the cowlings.

# Pontiac Centralizes Its Employment of Labor

Organization of Manufacturers' Association Has Eliminated to a Great Extent the Practice of Shop Raiding

By C. J. Shower

FOR the purpose of eliminating shop raiding and of equalizing the scale of wages, the manufacturers of Pontiac have banded together and formed the Manufacturers' Association, whose duty it is to keep an accurate record of all the employed men in the city, find employment for those who seek it and by the same token secure men for the factories needing help.

The association was organized in October, 1917, and since then (to June 4) it has placed 1540 men. It is upheld by the manufacturers by assessments levied on them each quarter, the amount varying according to the expense incurred by the association. One quarter it was 50 cents per employee and the last quarter it was only 40 cents.

## Acts as Central Employment Bureau

This association acts as a central bureau of employment. Any man in search of work applies at the office of the association, where an introductory card is filled out and given him to take to the factory where such help is desired. At the factory an application blank (Fig. 1) is filled out in triplicate. The original is sent to the office of the association the same day and the two copies are retained at the factory until the man leaves its employ, when the second sheet with the reasons for leaving is sent to the association for record. The third, or last, sheet remains at the factory.

From fifteen to twenty-five men apply at the association for work daily. During February and March the average was much higher—from twenty-five to fifty applications were received daily. It is the policy of the association not to place any man who is at the time employed in another factory. It was astounding what a large number of men came to the office and falsely stated

that they were out of work. An employee who states that he has notified his foreman or superior officer that he has quit is considered an undesirable employee and is treated accordingly.

About 5000 names of employees are in the "live" file at the association office—all alphabetically arranged. The cards bearing these names are called "history cards." An accurate record of the employees is kept. In addition to the personal history of the man, space is provided for the names of the places he has worked, and a record of every change is kept. The association can at any time refer to these cards and ascertain where a certain man is employed, how long he has been there, where else he has worked, and whether or not he has a high rating in his line (Fig. 2). A record is kept of all changes within the factory, that is, if an employee goes from one department to another the fact is noted on a slip of paper and sent the association (Fig. 3).

Every day all the factories send to the office of the association a report giving a review of the labor situation. The report made out on the last day of the quarter determines the amount of the assessment to be levied on that factory (Fig. 4).

## No Local Advertising for Help

It is agreed by the manufacturers of Pontiac that no advertising for help be done locally. If necessary to advertise, manufacturers must use outside mediums. It is claimed by the association that advertising for Sunday interviews has a demoralizing effect upon the local market. Very little has been done and the executive board recommends that it be not repeated. It is the belief of the association that fully 95 per cent of the men who answer such advertisements are employed. Many of

# Development of Propeller Manufacture

Output of American Factories Now Fully Equal to the Demand—Materials Used and Methods of Production—Theory of Blade Number

**T**WENTY-FIVE experienced American manufacturers are now producing between 350 and 400 airplane propellers per day, fitted for the most strenuous air service. Ample stock of propeller timber is already purchased or available and the present supply of propellers in this country is more than equal to the demand.

The number of spare propellers required for each fighting unit was reduced by the air service recently. Hence it has been possible to cut down the original program for the production of propellers.

After the declaration of war the Signal Corps was forced to build up the existing propeller industry and encourage the manufacture of propellers as a new enterprise.

## Growth in Number of Manufacturers

In April, 1917, there were four airplane companies making their own propellers. Each of these produced propellers in keeping with the requirements of their airplane output. In addition, six other companies made propellers for airplane companies not manufacturing them and for foreign governments, the U. S. Army and Navy, private aviation schools, and exhibition and amateur fliers. The total output last April was approximately 25 propellers per day.

Since that time, and especially since December, 1917, a great development has taken place. The older companies have expanded and new concerns have sprung up, due chiefly to the increased demand for propellers and the requests of the Signal Corps. The Government co-operated both in design and production, and this co-operation resulted in the adoption of standard methods and economical manufacture. The treatment of airplane propeller lumber was worked out, and many special machines and tools were developed and built, materially reducing the amount of hand work previously necessary.

American double-bladed airplane propellers are built up from boards about 1 inch in thickness, cut out to the rough shape of the laminations. Specifications for mahogany lumber for aircraft propellers as issued by the International Aircraft Standardization Board were printed in AUTOMOTIVE INDUSTRIES of May 23 last.

## Treatment of Lumber

The boards or laminations are cut out from carefully selected lumber which has previously been kiln dried to a uniform moisture content of from 6 to 8 per cent, great care being taken to avoid case hardening and too rapid drying, which may diminish the strength of the lumber. The laminations when cut for use in the propeller must be clear pieces, free of all defects and with straight grain running along the length of the piece. After cutting to shape, the boards are balanced individually and selected according to this balance for grouping together for the complete propeller.

Following this selection, the completed groups of laminations are assembled and placed in a hot box to prepare for gluing. With correct temperatures of material and room, gluing is done as rapidly as possible,

and the glued-up blocks are left in presses or clamps to set for 24 hours. The blocks are then cut down by carving machines, lathes, shapers, etc., to within about  $\frac{1}{4}$  inch of the final finished size and shape, and in this state are hung for two weeks in a conditioning room before being worked to the final finish.

The finishing operation is performed on the bench and completes the propeller to the point of being ready for varnish or covering. The bench work is done with great accuracy, to insure that the propeller conforms exactly to the desired pitch and shape and has the two blades in exact alignment and track. The propeller, acting as a flywheel for the engine, must be perfectly balanced. When the propeller is finished in the "white," it is ready for inspection of glue joints, dimensions and balance, after which it is finished with 5 coats of spar varnish and rebalanced.

Some propellers have the tips covered with linen fabric to protect them against splitting, which results from picking up sand, running in long grass or in the rain.

Existing opinion is somewhat divided as to the best wood for propeller purposes, but the past practice of the French and English Governments greatly favors walnut and mahogany for combat plane blades, the former being considered best. Other woods have been extensively used for training-type propellers, principally quarter-sawed white oak, birch, cherry and poplar. Originally the walnut used by the French was their own French walnut, but this wood is no longer available. American black walnut has taken its place, and large quantities have been exported to England and France for propeller purposes, as well as for the manufacture of rifle stocks. To-day the available supply of black walnut is limited by the ability of producers to obtain the scattered timber, and the demand is greatly in excess of the supply. The exclusive use of black walnut for rifle stocks manufactured in the United States has an important bearing upon the available supply for propellers.

## Mahogany Used Comes from Central America

All the mahogany used has, for the past four years, been exported as lumber from the United States, having been imported in the log from Central America and Mexico. Some of the largest and best tracts of mahogany timber are in British Honduras. This is being cut under the direction of the British Admiralty and brought into the United States for manufacturing into propeller lumber before exporting to England. Large quantities of British Honduras mahogany and other tropical mahogany have been exported, so that the existing situation is one wherein the available supply is just about adequate for the combined demands of the Allies and the United States, provided restrictions are placed upon the use of mahogany propeller stock for commercial purposes. This situation affecting the manufacture of furniture, pianos and the like can be relieved by the use of substitutes, such as Philippine mahogany, which is lacking in some qualities required by the specifications for propeller wood.

It is believed that quarter sawed white oak will come to be used more generally, on account of its greater

strength and the necessity for getting maximum strength in the propellers used on the newer high-powered, high-speed engines.

The amount of wood in the present two-bladed propellers varies from 30 board feet in a training type to 80 feet in a combat type. These figures are net, while the gross lumber required to manufacture will be about twice the net amount in both instances.

Many attempts have been made to design and produce a metal propeller, but to date no tests reported have been sufficiently successful to warrant putting the propellers into production. The difficulty is to construct the blade light enough and strong enough to resist the tensile and bending strains set up. Propellers have been manufactured from a synthetic material called "Bakelite," shaped under hydraulic pressure at a high temperature. To date these have been successful, in destruction tests and flight. They weigh slightly more than wooden propellers of the same design but have greater resistance to wear and tear.

In determining the number of blades to use in the pro-

PELLER, account is taken of the double requirement of developing the maximum efficiency in converting shaft horsepower into propulsive horsepower and at the same time developing a blade that will be adaptable to the construction of the complete machine.

The greatest efficiency is always obtained by a two-bladed propeller of the largest diameter that the engine will turn at the correct engine speed. In this way the propeller has an effective thrust over the maximum possible air area, with least blade surface resistance.

In many cases, however, the construction of the plane is such that a two-bladed propeller of sufficient diameter cannot be used on account of clearance, and the three or four-bladed propeller is adapted to take up the full horsepower in effective thrust, in spite of greater resistance losses. The four-bladed propeller is generally used instead of the three, because of its simpler and stronger construction features. The two-bladed propeller is more efficient than the three or four, and would always be used if the arrangement of plane and engine permitted.

## An Improved Cost Keeping System

Mechanical Time Recorders Make for Accuracy—Electric Clock System, Comprising a High Grade Master Clock and Secondary Clocks Throughout the Plant, Adds Further to Accuracy

A TIME recording system for cost keeping, making use of secondary clocks operated from a master clock by means of electric current, is manufactured by the Stromberg Electric Co., Chicago. The machine makes an imprint of the exact time on a card or work ticket, which may be placed in it for that purpose. As a rule, secondary clocks and time recorders are distributed throughout the shop, the clocks being operated from the master clock which is located in some central position, generally the main office. The master clock is a high grade timepiece and claimed to keep accurate time. The mechanism of this clock is used to periodically make electric contact, to the end that electric current may be transmitted through relays at regular intervals to operate the electromagnets of the secondary clocks. The master clock is self-winding, the work of keeping it wound being accomplished by the same current that operates the secondary clocks, and as all of the secondary clocks must always be in absolute synchronism with the master clock, the same time is shown by clocks throughout the plant.

The Stromberg company points out the advantage of the mechanical system of recording the time spent on different operations in the shop, insuring the greatest degree of accuracy in the cost keeping. When workmen are required to put down the time spent on different jobs with a pencil, they often wait until the end of the day and guess at the time worked on different jobs. It is obvious that this introduces appreciable errors.

We show herewith an illustration of the Stromberg company's time recorder and also reproduce a combination pay roll and cost coupon ticket worked out by the accounting de-

partment of the Metal Specialties Mfg. Co., Chicago, which is filled out from the records of a Stromberg time recorder. This ticket takes care of both day and piece work. It permits of quickly accounting for a full day's time. The top

Time card

coupon is marked under the employee's number in the payroll department and the totals are added at the end of the pay period. No daily posting is necessary. The job coupons go to the cost department and are there filed under their respective numbers and totaled when the job is completed. It is claimed that by this method much posting and chance for error are eliminated.

# Solving the Problems of Female Labor in a Car Making Plant

The Importance of Careful Selection of Women Employed and Sympathetic Supervision Over Them, as Shown in the Experience of the Maxwell Company—Rest Rooms and How They Should Be Used

*Women exclusively are employed in this department of the Maxwell plant. More than fifty of them are engaged here in assembling ignition and lighting wiring units*

**T**HE several problems incidental to the employment of women in large numbers in manufacturing plants where they have not previously been used to any great extent have been given careful study by the Maxwell Motor Co. of Detroit, where recently it was estimated that fully 12 per cent of the working force is made up of female operatives.

Special thought has been given by the Maxwell company to the method used in selecting the women who are employed, to adequate arrangements for and equipment of rest rooms, to the proper dressing of the women for their work, to the provision of hospital facilities and cafeteria. The company has its Supervisor of Female Welfare in the person of an experienced woman.

Great care is exercised by the superintendent of employment who hires the help to see that there are taken on only such women as are not working merely for pin money with which to buy clothes and luxuries. It is considered inadvisable to hire a married woman whose husband earns six dollars or more a day, as she would be very apt to leave on short notice after having earned suf-

ficient money with which to purchase some particular article or make certain investment, the desire for which had provided the chief reason for seeking employment.

The girls who apply for work at the Maxwell plant are first interviewed by the supervisor of female welfare, who ascertains particulars in regard to their ambitions, their home life and their physical condition. In order to minimize the percentage of transient help, they are thoroughly questioned as to whether or not their livelihood depends upon their employment. They are then turned over to the superintendent of employment, who has a faculty for reading human nature and hires only those who he believes will make the best grade of women workers.

## Success Largely Due to Careful Selection

By weeding out the applicants and recommending for employment only those who are likely to develop into good workers, much of the credit for obtaining such excellent results as have been obtained from the use of women at the Maxwell plant is given to the supervisor of female wel-

fare. She is a woman of very pleasing personality, who makes it her business to be a friend to all the girls, encouraging them and keeping them satisfied with their work and factory surroundings at all times.

If a girl is dissatisfied with the work she is doing, or if she desires to increase her earning capacity, she is transferred to some other job where she has more congenial surroundings or an opportunity to earn more money. If the work allotted to any girl is found too heavy for her she immediately reports at the supervisor's office, presents her statement of the case and is transferred to lighter work.

On a card index maintained by the supervisor a record is kept of the name of each dissatisfied employee, the nature of her work, her foreman, present wages, and the date on which the dissatisfaction was manifested. The matter is investigated by the supervisor, who confers in regard to the case with the foreman in charge of the particular department in which the girl works. If it is decided that an increase in pay is merited, or a change of work desirable, it is immediately put through. When the change or increase is made, a notation to that effect is made on the card in red ink and the card is disposed of in a dead file. In this way the women are kept satisfied and the company is saved much inconvenience and cost resulting from losing help and breaking in new operatives. The minimum wage at the Maxwell plant is \$2.50 per day and some of the women make as much as \$4.50 a day on piecework.

Rest rooms are regarded as of prime importance and are established chiefly as places for the women to change their clothes, and to provide space for the woman who is suddenly taken ill to rest in retirement. They are not in-

*One of the four rest rooms for women workers at the Maxwell plant. It is impressed upon the women that the privileges of these rest rooms must not be abused*

tended to be general loafing places, and women are not permitted to go to them at any time they may happen to choose for the purpose of loafing. If a woman is out of work she must remain at her machine or at least in the department where she is working. Lunching in the rest rooms is discouraged.

The Maxwell company maintains three spacious rest rooms, one of which is shown in an illustration herewith. The girls are allowed to spend their noon hour in them in dancing, reading or playing games. These rest rooms are furnished with lounges, easy chairs, palms; in fact, everything possible which would add to the comfort of the girls employed at the plant.

A matron is placed in charge of each rest room to look after the requirements of the girls and to keep the room in order. The girls are allowed to spend 10 minutes during working hours in these rest rooms, and, in order that the privilege may not be abused, the matron records when a girl comes in and informs her when her time is up. However, the precaution seems hardly necessary, as in only a very few instances is advantage taken of this privilege. Adjoining the rest room are cloak rooms, wash rooms and toilets. Another large rest room is being constructed at the Maxwell plant, as women are hired every day in increasing numbers.

In one section of the factory is a general hospital and doctor's office shown in the illustration herewith. Both men and women are treated in this hospital, there being separate rooms for male and female help. All employees are given to understand that no matter how small an injury may be, even if it is only a scratch, they should report at the doctor's office for treatment. In this department a physician is in charge assisted by two trained nurses.

#### A Restaurant on the Serve-Self Plan

A cafeteria for those women who do not care to bring their lunch is also maintained at the Maxwell plant. It is shown in the illustration herewith. It is conducted on the serve-self plan and the girls can have whatever they want to eat.

The women workers in the Maxwell plant are furnished with bloomer uniforms and caps in cases where the work

*A view of the Maxwell company's cafeteria, exclusively for women*

is dangerous. These uniforms are laundered and kept up at the expense of the company. The women go about their business in these uniforms without any annoyance from men employees. The men are warned by the foreman of each department that such conduct would constitute a serious offense and the guilty liable to dismissal.

Visiting among female employees during working hours is discouraged by the foreman, and the machines on which the girls work are spaced far enough apart so as to preclude conversation or whispering among the girls during the working period.

#### Much Depends on Foremen

According to the views of those in charge at the Maxwell company, success in adapting women to the industry rests with the foremen, who should aid in their proper training, and at all times lend their influence to maintaining good deportment. The women who are serious-minded and show a desire to improve and become adapted should be given careful and painstaking encouragement; while, on the other hand, those who do not adapt themselves to conditions and are prone to visiting soon eliminate themselves.

*General hospital and doctor's office at the Maxwell plant. There are separate rooms for male and female employees in addition to the general office shown above*

## An Innovation in Strip Steel Practice

THE rapid development of the automotive industries and their demand for improved materials have led to the introduction of new methods in rolling and handling strips in standard and alloy steels. To meet the requirements especially of the automobile industry, the National Pressed Steel Company has recently put down an interesting plant at Massillon, Ohio. This plant was designed to turn out a wider range of sizes and the proper quality of hot and cold rolled strips used in deep drawing, stamping, forming and pressing operations.

In order to be able to accurately gage the demands of the trade, a questionnaire was prepared containing thirty-seven questions. This was sent to a large number of manufacturers of pressed and drawn products, and the returns from it were most satisfactory, inasmuch as 47 per cent of those addressed answered either all or some of the questions posed. The information thus obtained, relating to the size, finish, chemical analysis and physical properties of the steels used by those addressed, was made the basis for the design of the new plant. In spite of the adverse conditions in the materials and machinery markets, it was only ten months and one day from the time ground was broken until the new plant was in operation.

For the product of the new plant it is claimed that it can be used without annealing for many purposes which have called for annealed strip heretofore. Raw material is received in the form of slabs and billets and is unloaded from the cars by means of cranes carrying rectangular lifting magnets. Before any material is placed in stock or used, each piece is carefully inspected for seams, pipes or any other defects which could be rolled into the steel by later manipulation and not detected until the material was in the customer's presses. The stock yard has a capacity of from 15,000 to 20,000 tons of steel and adjoins the mill building.

Great care and attention were given to the design and detail for the furnaces to insure uniform heating. They are of the large continuous reheating type, using powdered coal as fuel. All parts and accessories were specially designed and constructed for this method of heating. Pushers, drawing machinery, door hoists, transfer tables and all equipment auxiliary to the furnaces are electrically operated. The steel is transferred to the roughing mill in a unique manner, and in such a way that practically all furnace scale is removed.

The roughing mill is a high speed 24-in. two high universal mill and is driven by a Westinghouse reversing motor similar to those used in blooming mills, but smaller and much faster.

An idea of the extreme proportions of the mill will be conveyed by the statement that the housings weigh approximately 42 tons each, and that all other parts are correspondingly heavy. When it is borne in mind that this company produces large quantities of special alloy steels in the form of strips up to No. 00 gage by 24 in. wide, the necessity for such heavy units will be appreciated. The extreme rigidity of the mill and foundations are also realized upon considering that when finishing 0.50 carbon steel less than one-thousandth inch (0.001 in.) is allowed for spring of the mill. The vertical rolls on this mill are designed and operated so that proper side work may be given the steel. This method of rolling also holds the width dimension to slight variation.

If the material is brought to gage on the roughing mill, the strip is turned over after rolling in order to facilitate inspection and remove any slight remaining scale. It is then transferred to a leveller or straightener of extremely rugged construction. From this the product is delivered to the hot bed.

When producing lighter material only the roughing operations are used on the roughing mill, as a train of finishing mills has been provided for the final passes. These mills are operated entirely by mechanical means—no manual labor being required. Driving power is furnished by a Westinghouse motor of the Kramer type, permitting a wide range of operating speeds with good electrical efficiencies.

From these mills the material is delivered to hot bed or coiler as may be required. On leaving the hot bed the strips are cut to length and piled by a mechanical piler, placed in stock if they are to be shipped as plain hot rolled material, or transferred to the finishing department if additional treatment is required.

In addition to the usual slitting, shearing, oiling and liming machinery, the finishing department has extensive facilities for heat treating and pickling. Each furnace has a charging capacity of approximately 25 tons and also the necessary mechanical means for reading and heat control, assuring uniform and proper heat treatment. The furnace men can observe and control the furnace temperature at all times, but the recording instruments and the records are seen only by the department superintendent, who thus has a definite and accurate record of all conditions and every operation employed on past work. The pickling vats are of the plunger type in standard details, but of large size for pickling large pieces whether flat or coiled. The steam for heating pickle liquors and other miscellaneous heating processes is generated by a boiler placed over the annealing furnace flues.

# War Airplanes of To-Day

A Comprehensive Collection of Photographs and Descriptions of the  
Scout, Reconnaissance, Battle and Bombing Planes and  
Flying Boats in Use in the World War

(Concluded)

**I**N the July 4th issue of AUTOMOTIVE INDUSTRIES appeared the first part of this comprehensive collection of photographs and descriptions of airplanes, employed by the warring powers in Europe, which formed the basis of the paper which was presented at the Dayton meeting of the Society of Automotive Engineers by Fay Leon Faurote.

The planes shown and described previously were the Bristol tractor monoplane and scout tractor biplane, the Morane Parasol and three place tractor; the Spad pursuit biplane, the Pomilio and the Thomas Morse single seater. The remainder of the collection is shown on the following pages.

## HALBERSTADT SINGLE-SEATER MACHINE

Equipped with an Argus or Mercedes engine. Fish-shaped fuselage. Staggered planes—the upper plane with overhang. Width, 28½ ft. and length, 24 ft.

## MARTINSYDE SCOUT TRACTOR BIPLANE

One-seater, powered with a 120-hp. Beardmore, which drives a two-bladed, 9 ft. 6 in. propeller with pitch of 6 ft. Span, 38 ft.; chord, 5 ft. 11.75 in. Gap, 5 ft. 8 in. Overall length, 26 ft. 6 in. It is moderately fast, making 98 m.p.h. near the ground and climbing 3000 ft. in 4 min. The complete machine unloaded and dry weighs about 1400 lb.

## D. F. W. AVIATIK C V

The wings have a dihedral but no sweepback. The span of the lower wings is 42 ft. 5 in., nearly equal to the span of the upper wings, which is 43 ft. 8 in. The ends of the upper planes are oblique, those of the lower retracting and rounded. The maximum chord is 5 ft. 9 in. The total lifting surface is

about 421 sq. ft. The gap is 5 ft. 7 in. The angle of incidence of the upper plane is 5 deg. from the cabane to the sixth rib and 3.3 deg. at the thirteenth rib, where the ailerons commence. There are two pairs of struts on either side of the fuselage. The metallic ailerons are rectangular with rounded ends. The empennage has a heart-shaped appearance. The fuselage, rather shallow in depth, terminates in a vertical knife-edge in the rear, with a somewhat pointed propeller pot in front. It has the standard landing-gear.

The D. F. W. is equipped with a fixed Benz engine of 228 hp. at 1410 r.p.m., almost entirely inclosed in a special cowl. The radiators are mounted on the sides of the fuselage. The pilot sits on the gasoline tank, with a machine gun within easy reach of his right hand; the passenger sits behind in rear cockpit. The full load carried is 2100 lb., of which 660 lb. is the useful load.

## C-4 RUMPLER (GERMAN SINGLE-SEATER BIPLANE)

The upper plane is 12.6 m. span, the length, 8.4 m., height, 3.25 m., chord, 1.7 m., gap, 1.85 m., dihedral angle, 2 deg., the angle of incidence, 5 deg. and a sweepback of 3 deg.

The C-4 is generally equipped with a 200-hp., six-cylinder Mercedes. The tank capacity is 290 liters. Contrary to German practice, the trailing edges are rigid.

The upper wings are cut out for visibility above the body. The lower wings have rounded tips like a D. F. W. It has two pairs of interplane struts on either side, narrow horizontal stabilizers and balanced elevators. The control cables are carried entirely within the body in wooden tubes. The fuselage is of regular construction of wood and wires. The engine is similar to that used in a Zeppelin; its radiator has blinds. It is equipped with one fixed Spandau machine gun.

Halberstadt (German)

Aviatik DFW (German)

Martinsyde Scout (British)

Profile of the Rumpler C-4 type (German)

The pilot sits in front, the gunner in the rear. It has a Parabellum gun placed in the rear and four bombs, radio and camera are carried.

It will climb 16,400 ft. in 35 min. The machine is good for all purposes and high altitudes have been made with it. The machine can fly 4 hr.

#### STURTEVANT SINGLE-SEATER SCOUT

It has pyramid trussing. This is a half-wing feature made by the steam-lining of the single lower spars. The stationary engine is carefully cowled. Overhead radiators are set into the wings. Its design affords a wide range of view and good facilities for mounting a machine gun. Its compactness is notable. All structural parts are built of vanadium steel. It is fitted with 150-hp. Sturtevant engine, of the eight-cylinder, water-cooled type. The net weight is 1000 lb.

#### VICKERS SCOUT ES-1 ONE-SEATER BIPLANE

Rather chubby fuselage; small wing span, 24 ft. 4½ in.; only 20 ft. 4 in. long and 8 ft. 10 in. high. Driven by 100 to 110-hp. air-cooled Clerget or 110-hp. LeRhône, equipped with 8-ft. 6½-in. propeller of 8-ft. 2½-in. pitch, two-bladed. Aspect ratio 5.1. Small dihedral of 1 deg.; no stagger and no angle of incidence. Chord, 4 ft. 9 in.; gap, 4 ft. Total weight, 1500 lb. Carries 28 gal. of gasoline and 6½ gal. of oil. Climbs 10,000 ft. in 18 min. Maximum speed, 112 m.p.h.

The Vickers Scout is a difficult machine to fly and tiring

*Vickers Scout E.S.1. with rotary engine (British)*

on the pilot. Great care is required in landing. The machine is tail-heavy with the engine on. It will get off in about 325 ft. and can be stopped in 600 ft. if the engine is off. A slightly better performance is attained by the use of the 110-hp. LeRhône engine.

#### ENGLISH S.E.5.A. SINGLE-SEATER FIGHTER

The two wings have an area of 22.8 sq. m.; span, 8.15 m.; chord, 1.52 meters. Stagger, 0.46 m. The wings have no sweepback. Dihedral, 171 deg. The lower wings are cut away near the body for a better view. The angle of incidence of the wings is 5 deg.

The interplane bracing is streamline wires. That of the overhanging portion is thick-ended wire. The trailing edge of the wings is formed by a wood strip. Between every two ribs are two short false ribs running from leading edge to front spar. The engine section struts are steel tubes streamlined with wood fairings. The interplane struts are of wood. The lift wires are in duplicate and landing wires single. Non-balanced ailerons are hinged to the rear spar on both upper and lower wings.

The fuselage is a type of girder, and has a turtleback formed by vertical formers. It is covered up with wood as far as the pilot's seat. The tail plane, cambered on both sides, is so attached to body that its angle of incidence can be varied during flight from + 4.5 deg. to - 3 deg. The front spar oscillates freely from end; the rear spar and its bracing is attached to a tube, which can be raised or lowered in the stern post of the body.

The under-carriage is of the usual type. The tail skid,

*Sturtevant Scout (American)*

which is of unusual construction, is swivelled from the stern post and connected to the rudder control-cables. A brass shoe is sprung by means of two spiral springs inclosing telescopic tubes.

The inclosed Wolseley-Hispano engine develops 206 hp. at 2005 r.p.m.

The radiator forms the nose of the body. Shutters operated from the pilot's seat permit of covering up about half of the radiator. The main gasoline tank is mounted behind the engine on the upper longerons.

The fixed machine-gun is mounted to the left of the pilot inside the body covering. The firing of the gun is operated hydraulically by control mechanism in front of the engine, and driven by spur gearing on the propeller. The trigger is mounted on the control lever. On a bent rail above the center section of the upper plane is a Lewis machine-gun which can be pointed to fire upward during flight.

The weight of machine empty is 706 kg., and 250 kg. useful load is carried.

### Battle Planes

#### BREGUET RECONNAISSANCE TWO-SEATER

It is powered with a 450-hp. Renault twelve-cylinder engine. The gross weight is about 3700 lb. It carries a live load of about a half ton. It has a spread of 38 ft., a small dihedral on the upper plane only and a little sweepback. It is made largely of aluminum, the ribs are wood. The speed is about 128 m.p.h., and the machine will climb 16,000 ft. in 19 min. It carries four machine guns. It has a double set of ailerons, the lower ones being longer and extending from the wing tip nearly to the body. The elevators are balanced. There are two vertical fins and a vertical rudder. It has a three-wheeled landing-gear. The machine may be recognized by its three sets of struts on either side and set of V-struts in the

*Breguet in flight (French)*

Twin-engined Bristol (British)

center, the line of which if continued makes a large V with the front landing-gear. An M is formed by the trussing of landing-gear.

#### BRISTOL WITH TWO 120-HP. BEARDMORE ENGINES

Two two-bladed propellers of 9 ft. 6 in. diameter and 7 ft. 8½ in. pitch. Weight, 5210 lb. Maximum speed, 85 m.p.h. Comparatively wide span of 53 ft. 6 in.; overall length, 39 ft. 2 in., and is 12 ft. 8 in. high. Capacity for 115 gal. of gasoline, 9 gal. of oil, and 10 gal. of water. Total wing area, including tail planes and elevators, 945 sq. ft., making a loading of 5.5 lb. per sq. ft. Aspect ratio, 6.7. Stagger slightly less than 1 ft. Dihedral, 4 deg.; angle of incidence, 2 deg.; chord, 8 ft.; gap, 7 ft. 10½ in.

This machine is heavy and extremely trying to fly. It has to cover considerable ground to get off and cannot be landed in a small field. It is a very slow climber, taking 54 min. to climb 10,000 ft.

#### L.V.G. (MADE IN TWO TYPES)

The D-9 has a 175-hp. Mercedes or Benz engine, the D-2 a 235-hp. engine. It is distinguished by its half-negated ailerons. The D-2 has a wing chord greater near the fuselage than at its extremities.

#### GERMAN RUMPLER TWO-SEATER MACHINE

It is equipped with a 260-hp. six-cylinder vertical engine, but actually develops 286 hp. at 1500 revolutions. It has little dihedral and very little stagger. The war load is 1150 lb., and it will attain a speed of 110 m.p.h. It cannot climb very

Captured L.V.G. (German)

well, making only 14,000 ft. in 35 min. and 16,000 ft. in 43 min. Its weight is 10.6 lb. per square foot.

#### BRISTOL TWO-SEATER TRACTOR BIPLANE

One of the best known of British reconnaissance machines. Powered with a 200-hp. water-cooled engine, driving a four-bladed propeller of 8 ft. 1 in. diameter. Credited with air speed of 111 m.p.h. At this speed it consumes 14½ gal. of gasoline with the engine running at 1290 r.p.m. Equipped with this engine it climbs at the rate of about 68 m.p.h. Wing spread, 42 ft. 6 in. Overall length, 31 ft. 1 in.; 10 ft. high Aspect ratio, 7.7. Dihedral, 3 deg.; stagger, 12 in.

Equipped with a 310-hp. Rolls-Royce and crew of two, this bombing machine carries a total military load of 545 lb., makes a speed of 130 m.p.h. at 10,000 ft., and climbs 15,000 ft. in 21 min. It has an air endurance of four hours at full speed at 15,000 ft., including climb to that height. The machine weighs fully loaded 3575 lb. The machine is modern in design and has a tail that can be adjusted by the pilot so that he is enabled to climb at any speed without effort.

#### BRITISH FE 2-B TWO-SEATER PUSHER BIPLANE

Equipped with 160-hp. Beardmore and four-bladed propeller 8 ft. 11.9 in. diameter. Wing spread, 48 ft. Chord, 5 ft. 6 in. Gap, 6 ft. 3 in. It is 33 ft. 4 in. long and 12 ft. 8 in. high. Carries total useful load of 976 lb. Total flying weight is 3037 lb. The best climb with which it is credited is 10,000 ft. in about 40 min.

It is very stable and is especially useful for photographic

Battleplane (DH4) built in United States

FE26 (British) Pusher Plane

and reconnaissance work. Being a pusher the engine is located in the after part of a nacelle, and the empennage is carried at the extremity of a V-shaped outrigger system of trusses. The machine has a wide tail with a comparatively small chord. The nacelle projects forward from the central portion of the machine and carries a pilot in the after cockpit and a gun and gunner in the forward. The landing-gear has the well-known third wheel in front. The machine is readily distinguishable on account of its peculiar rudder form.

#### S. I. A. TWO-PLACE COMBAT MACHINE

This Italian biplane has remarkable air endurance. It made a nonstop flight from Turin to London and a 100-mile flight from Turin to Naples and return. It is equipped with a six-cylinder Fiat engine with an exhaust stack leading to the upper plane. Both planes have an equal span. Central braces from the fuselage to the upper plane are in the form of a letter W. The trailing edges of plane surfaces are straight and not formed of wire. A balanced rudder is used. It has a high forward compartment and flies in a tail high position so that the pilot-seat is unobstructed.

#### FARMAN F-40. SINGLE AILERONS ON UPPER PLANE ONLY

Pusher type of biplane with a Renault or Lorraine-Dietrich engine. Nacelle above the lower wing plane which has only about two-thirds the span of the upper panel. Empennage carried at end of outriggers, which terminate in vertical knife-edge.

#### ROLAND (GERMAN) TWO-SEATER WITH 175-HP. MERCEDES

Carries machine gun and bombs. Fuselage egg-shaped, very high and narrow. Windows provided in sides of fuselage for observation. Fuselage fills in entire space between wings. Only one interplane strut on either side of fuselage. Planes considerably staggered. Fin and rudder very high.

The DH4 (British)

S.I.A. (Italian) with 300-hp. Fiat engine

#### ENGLISH DH4 (REDESIGNED TO TAKE THE LIBERTY ENGINE)

This machine has a wing-spread of 42 ft. 7 in. Its length over all is 30 ft. 7 in. It is equipped with one Liberty twelve 420-hp. engine. Its weight, empty, is 2337 lb., and when completely loaded about 4100 lb.

### Bombing Machines

#### TWIN-ENGINED A. E. G. (GERMAN) BOMBING BIPLANE

Basically the A. E. G. bomber is similar to the Gotha biplane, the latter being somewhat larger however; also the former has its two propellers placed in front of the main

Reconnaissance Farman (British)

planes—the Gotha has pusher screws. The wings sweepback, are placed at a dihedral angle, appearing larger in the bottom than in the top plane. The span of both wings is the same, 57 ft., the overall length about 30 ft. The ailerons, peculiar in shape, are fitted to the top wing only and operated by a crank lever working in a slot. The tail wings, of monoplane type, have fixed stabilizing planes and a vertical fin-hinge to elevators and rudder respectively. Elevators and rudder have forward projections in order to partly balance them. The tail skid, which is under the stern of the fuselage, is sprung, not by rubber shock absorbers, but by coil springs. This is also the case with the landing-chassis.

The material used in the construction is mainly steel; the ribs and main planes are of wood. The main spars are of steel tubes. The fuselage is built up of steel tubes, also the longerons, struts and cross members. These are connected by welding; the joints are stiffened and an anchorage provided for the cross bracing wires by triangular pieces of sheet steel welded to longerons and struts.

There are three divisions for passengers. The cockpit in the extreme nose provides a seat for the bomber, who sights through openings in the floor. A rack is placed at the right for holding bombs. Under the center of body there is another bomb-holding rack and near the inner ends of the lower plane there is space for more. The center cockpit has two seats for two pilots or two pilot gunners. Behind the pilot's cockpit is the gunner's, who operates a machine gun mounted on a turntable. The engines are generally of 260-hp. Mercedes

*Breguet Bomber (French)*

type, and placed one on each side of the center section of the lower plane. The main gasoline tank is carried in the pilot's cockpit, and a service gasoline tank is fitted in each engine housing. The speed is not known, but is roughly estimated at about 90 m.p.h. The head resistance appears to be excessive.

#### BREGUET BOMBER OF TRACTOR TYPE

This machine is an example of excellent streamline construction and compactness, and its construction represents a marked advance in engine cooling. Attention is called to the louvers in the cowl, and also to the clean opening between the panel and the fuselage. It is being used for bombing and has a great carrying capacity for its size. Its war load is 1900 lb. It has a speed of 110 m.p.h. and will climb 12,000 ft. in 33 min.

#### TYPES OF CAUDRON MACHINES

The Caudron G-4 has two rotary LaRhône engines carried in small nacelles between the planes. The pilot's nacelle is situated between the engine nacelles. The empennage is carried on four outriggers running back on a line with the engines, the lower outriggers acting as landing-skids. The four fins and four rudders are carried above the tail.

The Caudron G-6 has two rotary LaRhône engines and four

landing-wheels. The upper wing is large with a considerable overhang. The lower wing is much smaller and narrower. The trailing edge is flexible. There are twin powerplants in line with the centerline of the landing-chassis. The fuselage is fish-shaped and in the center of the machine. The two main struts are on either side of the engines; the outer forms part of the triangular truss with a slanting strut supporting the overhang of the wing.

In the Caudron R-4 the Hispano or Renault engines are used. The landing-gear is made up of five wheels, a set of

*The Voisin (French)*

two each under each engine and one small fifth wheel under the nose of the fuselage.

The Twin Caudron is a bombing machine, equipped with two 110-hp. LaRhône engines. The 1914 model was the first twin-engined machine ever built.

*Caudron Twin Tractor Biplane (French)*

*Handley-Page Bomber in flight (British)***VOISIN PUSHER TYPE OF BOMBING PLANE**

The Voisin of 50-ft. span carries a useful load of 1000 lb. The maximum speed of 80 m.p.h. and climbs 6000 ft. in 15 min. It is powered with a 150 to 200-hp. Renault engine, and has a cruising radius of 4 to 5 hr. The Voisin has no fuselage. It has a balanced rudder and a balanced elevator carried on four tubular outriggers, which terminate in a vertical knife-edge. There is no horizontal fin. The gunners sit very far forward.

Various engines are used: the Peugeot, the Renault and the Salmson. A small cannon and a machine gun are carried. Both pilot and gunner sit in front of the engine. The machine gun may be fired forward and backward over the upper plane.

**HANDLEY-PAGE BRITISH BOMBER**

This is a very large machine (in the same class as the Russian Sikorski, the Italian Caproni and the giant Curtiss boats. Wing spread, 97 ft.; length, 47 ft.; and height, 15 ft. Chord, 9 ft. 6 in.; gap, 9 ft.; no stagger and no sweepback, a small dihedral, and an angle of incidence of  $3\frac{1}{2}$  deg. It carries sufficient fuel so it can stay up from 10 to 12 hr. Its gross weight is about 13,000 lb. and it carries a useful load of a little over a ton. Its maximum speed is about 88 m.p.h. and it will climb 10,000 ft. in 30 min. Powered with two 450-hp. Rolls-Royce engines. All-wood fuselage with passenger compartments below and a gunners cockpit in the nose.

In spite of its size, the machine has been a great success, and it is to be expected that even larger machines of this character will be manufactured.

**CAPRONI TRIPLANE WITH THREE ENGINES**

It is equipped with three 200-hp. Fiats or Isotta-Fraschini engines, two located in the tractor position at the front of the fuselage and one pusher at the rear of the pilot's nacelle. It carries about a ton and a half. Next to the Curtiss triplane

boat it is the largest triplane that has ever been built and successfully flown. It has five sets of struts on either side of the engines. The planes have practically no stagger, no dihedral and no sweepback. The empennage is very wide but has a small chord, and the elevator is a single narrow tail-flap with three balanced rudders above it. The landing-gear is composed of four pairs of wheels, one set under each fuselage. The fuselages are very long and only about half as deep as the gap. They are located just under the middle wing panel.

An unusual form of skid prevents the machine from turning over when landing. The machine is used for bombing and has a very large cruising radius.

*Burgess U-2 Hydroaeroplane (American)*

*Macchi Flying Boat (Italian)*

### Flying Boats

#### BURGESS "U-2" NAVY SEAPLANE

The length over all is 30 ft. 5 in.; the width, 46 ft. 9 in.; height, 11 ft. 2 in.; chord, 6 ft. 3 in.; gap, 6 ft. Its supporting area is 574 sq. ft. The weight, when empty, is 1800 lb.; its live load 600 with a 100-hp. Curtiss OXX engine. Its low speed is 48.3 m.p.h., its high speed 75.2 m.p.h. It will climb 300 ft. per minute.

#### F. B. A. FLYING BOAT OF PUSHER TYPE

Equipped with a Gnome, Clerget or 130-hp. Hispano-Suiza engine. It has a span of about 46½ ft., a chord of 6 ft., and a gap of 5 ft. 9 in. It is 32½ ft. long. The engine is mounted well up between the planes on an inverted V frame. There are three sets of vertical struts on either side with a set of inclined ones at the ends.

The after part of the boat comes to a rather sharp point. The fins and rudder are mounted at some distance above the hull. The front of the hull is whale-shaped with room for pilot and passenger side by side in a forward cockpit.

#### MACCHI FLYING BOAT (ITALIAN)

This boat has a very peculiar tail, Nieuport V-type of strut, is a pusher type and is very fast. Single-seater, fine construction, light weight, high-powered motor, quick climber. Head resistance slight. Struts and interplane bracing similar to Nieuport. Isotta-Fraschini engine. Over all dimensions: span, 39 ft. 4 7/16 in.; length, 27 ft. 3 in.; height, 9 ft. 10 1/16 in.

#### ARMSTRONG-WHITWORTH (90-Hp. R. A. F. ENGINE)

Two-seater, tractor stick-controlled biplane school machine. Aspect ratio, 7. Dihedral at the top, 3½ deg.; at the bottom, 2½ deg. Stagger, 1 ft. 11.6 in., a chord of 5 ft. 8.3 in., gap 5 ft. 10.9 in., and angle of incidence 2½ deg. It is equipped

*Löhner Flying Boat (Austrian)**A Curtiss Flying Boat (American)*

with R. A. F. 90-hp. air-cooled engine, which at 1700 r.p.m. drives a four-bladed propeller of 9-ft. diameter, 10-ft. pitch. It carries a military load of 80 lb., a human load of 360 lb., total load of 440 lb. The weight hp. ratio is 22.8. Span, 40 ft. Over all length, 28 ft. 9 in. It will climb 10,000 ft. in 49 min., and has a speed of 72 m.p.h. Total weight, 2050 lb. The air endurance is 3 hours. It consumes 9.3 gal. of gasoline and 3.3 pints of oil per hour.

Length of run to unstick, 85 yards. Length of run to pull

*Ago (an Austrian flying boat)*

up (engine stopped), 120 yards. Single stick control. It will climb 12,300 ft. in 78 min.; rate of climb 75 ft. per minute.

#### AGO AUSTRIAN FLYING BOAT

This is a two seater sea-going fighter. There are no wires employed in the structure of the wing cell, which is composed of two cross-networks consisting of a front spar and a rear spar and of adjacent struts in inclined planes connecting the spars. The struts are of steel tubing with a fairing of laminated wood with good streamline effect.

The span of the upper plane is 8 m., the lower 7.38 m., and the chord for both planes is 1.50 meters. The length over all is 7.62 m. It is powered with a 218-hp. engine.

The carefully stream-lined shape of the hull and complete covering of cables and control wires are designed to decrease head resistance as much as possible.

#### AUSTRIAN LÖHNER FLYING BOAT

In this six steel struts are placed on either side, and, two by two, are connected in transverse planes with steel tubes. The upper plane span is 9.70 m., the lower span 7.20 m., the chord of the upper plane 2.70 m., that of the lower 2.20 m. The length of the hull is 12.50 m. The capacity for carrying bombs is 400 kg.

It is equipped with a 300-hp. Austro-Daimler twelve-cylinder V engine.

# Tubing in Airplane Construction\*

## Manipulation of Tubes and Design of Tubular Structures for Aircraft

By A. G. Hackett

THE possibilities of tube manipulation, such as butting, tapering, drawing with taper gage, expanding, flanging, bending, lapping, etc., are becoming better understood. Some designers, however, while recognizing the usefulness of these different operations, still ask for what is not commercially possible, because they fail to make allowances for the alteration in the thickness of the tube which will occur as the result of such operations. For instance, if the diameter of a tube is increased the thickness of the wall is reduced, and if decreased in diameter the thickness is increased. Again, if a tube is flanged, the flange will not be of uniform gage, but will decrease in thickness as it increases in diameter.

A section of a bent tube cut from an F.2.B. undercarriage "V" strut shows that the gage of the tube has, by bending, been reduced on the outside of the curve from 0.061 in. to 0.048 in., and increased on the inside from 0.061 in. to 0.072 in. The thinning of the tube would cause it to break if it had not been properly annealed; and, further, if proper mandrils had not been used, or the tubes had not been filled with suitable material, a series of "puckers" or "corrugations" would have been formed on the inside of the bend. Where proper thickening up of the wall along the inner curve takes place in bending the bent portion of the tube is the strongest, but if "puckering" takes place this point becomes the weakest.

Bending is sometimes carried out with steel tubes in the hot state, but where strength is required this is bad practice, as by heating the tube is rendered much weaker than it would be if bent in the cold state. Of two "V" struts, one bent in the hot and the other in the cold state, and the same weight being applied in each case, it will be seen that the tube bent while hot has been distorted much more than the other.

### Tubular Joints

Generally speaking, structural work for aircraft purposes is to-day carried out by means of sockets placed in suitable positions and arranged to receive the ends of the various tubular cross-members and bracings. These tubes and sockets are connected in three or four ways, namely:

By brazing.

By silver-soldering.

By soft-soldering.

Sometimes the sockets or lugs are dispensed with, in which case the cross-tubes are mitered and welded direct to the main tube.

The latter method is not advisable except in very rare instances, as any operation involving great heat is dangerous, owing to the weakening which results from the annealing or perhaps burning of the steel.

Another method is sometimes employed in which the cross-bracings are connected by means of a hinge joint to a sleeve on the main tube (i.e., a trapped end tube with a nut and bolt).

Of types of lugs used in aircraft structural work, perhaps the most common is the lug made up by one long sleeve, with two branches mitered and welded on. Into and through these the main and branch members are fitted, and are held there, preferably, by soft-soldering and pegging. Another form of lug is made in two halves, pressed to shape, trimmed to depth, and welded along the joints. A wiring plate may be included. A three-way lug, with double wiring plate is common.

It will be useful to give the results of some comparative tests made on these various methods of jointing tubular structures, but before doing so we would remark that, in a paper like this, only the fringe of the subject can be touched. Everyone who is in any way connected with the practical side of aeronautical construction will readily call to mind many other types of joints, each designed for a special purpose or to overcome a constructional difficulty.

### Soldering, Brazing, or Welding

Speaking from an experience of at least eight years in which we have been in touch with aircraft construction and design, we have met with a surprising amount of fluctuation in the respective popularity of soldering, brazing, welding, etc., for steel tube work, all these methods having been ruled out in turn, only again to find favor in certain quarters. This is partly due to the fact that machines designed by private manufacturers have been brought into great popularity, and the methods and designs of such makers adopted.

We have seen welding carried almost to excess and then almost abolished. Brazing has been boomed and then decried, and soft-soldering substituted for it—with a different type of lug or joint to allow for the reduced strength of the jointing material.

This, again, has been deemed unsafe, and silver-soldering, or hard-soldering, has risen into prominence, and to-day one hardly knows which type really is the popular one, as on the machines now being built for war purposes all styles and types of jointing may be found.

One has to realize that in all these methods the human element comes much into play. For instance, it is possible so to weld a joint that it appears to be sound, yet it may be a "fake"—metal being merely laid on and not fused with the surrounding parts. Or, again, the welded joint may be burnt, thus causing a dangerous weakening.

Similarly with brazing, it is possible with care to make a fine type of joint, but the probability is that in a certain percentage of cases overheating will take place and failure result.

We will now deal with the results of a few experiments recently carried out on certain of these types of joints.

### Soft-Soldered Joints

Let us take soft-soldering first. In all cases the tests were made with a soft-solder composed of 60 per cent tin and 40 per cent lead—using "Fluxite" or some similar article as a flux.

Tubes of various gages were tried, but up to a certain point the strength of the soldered joint was such that the tube failed in tension without the joint giving way.

It was found that the strength of a soldered joint is much greater than it is generally supposed to be, and from experiments carried out, the clearance or thickness of the soldering material does not, between the limits of 0.001 in. and 0.008 in., make much difference, but for any components that can be guaranteed to size we would recommend as "thin" a joint as possible.

A striking example of a strong joint of the soft-solder type was given, an elevator "bloater" and its tube being selected for the purpose. The test on this joint was carried out in order to prove to the satisfaction of inspectors that the stipulated minimum clearance of 0.005 in. on the diameter was not necessary. In this particular case the elevator lever (or

\*From a paper read before the Aeronautical Society of Great Britain.

"bloater") was held stationary while a torsional load was exerted on the tube. The result showed that the tube twisted and buckled without affecting the soldered joint.

One of the chief arguments against the use of soft-solder is the reduction in strength resulting from vibration, it being claimed that this form of joint will not sustain a vibratory load nor a series of shocks. This may sometimes be right, but even under these conditions a very satisfactory result can be obtained if the sweating is done thoroughly and well, and added strength is given if the joint be "pegged."

#### Tests on Soldered Joints

The writer recently carried out some experiments on what may be termed a "tup-testing machine" for soldered and brazed joints. It will be noted that the rising and falling tup or hammer is actuated by a bell crank lever, worked by a "sudden-drop" cam rotating in the direction of the arrow. The dead load on the tup shaft can be varied by means of the sliding weight. This consisted in fitting a tube into a lug or socket and then tapping—or "tupping"—it on the end to try and drive it further into the socket. A standard drop of 4 in. was arranged.

It was at first thought that the effect of the "tup" action would be to quickly rupture the joint, but to our great surprise the joint held to such an extent that we found it necessary during the test to increase the load from 10 lb. to 24 lb. The following are the details of the test:

Size of tube: 1 in. outside diameter by 18-gage.

Depth in socket (or lap):  $\frac{1}{2}$  in.

Thickness of solder: 0.005 in.

Number of blows: 113,500 with 10 lb. weight up.

Further number of blows: 64,000 with 24 lb. weight up.

At this stage the joint showed signs of giving way, so it was decided to apply a tensile test to see if the repeated blows had in any way deteriorated the solder. To our surprise the tube did not pull out until a load of 5.2 tons had been registered, giving the excellent result of 3.31 tons per super inch on the solder lining.

It may be urged that these results are not a fair basis on which to reckon, as they do not represent the ordinary work of the average operative. In answer, we would say that these results were all obtained from test pieces sweated by different operatives, in some cases being the work of girls with about two months' experience.

It may be possible to work out a formula to arrive at a basis for designers of soft-soldered joints, but even here, as in all calculations relating to structures, other factors have to be taken into account. For instance, a joint may be quite strong enough if in a 1 in. by 20-gage tubular joint the solder reaches to a distance of  $\frac{1}{2}$  in., and working on this basis it follows that the same distance for a 2 in. diameter tube of the same gage would be correct, but no one would be satisfied with this, and would naturally double the length of socket to meet the increased diameter.

Generally speaking, it may be taken for granted that with ordinary care, and with a good quality of soft-solder, a joint can always be made to withstand a shearing stress of  $2\frac{1}{2}$  tons per super inch on the solder itself—provided (and this is the crux of the whole matter) that the articles are well tinned and cleaned prior to the operation of sweating.

#### Choice of Sweating Apparatus

As regards the apparatus for sweating, different people will have a different choice, but having tried soldering irons, blow-lamp, coal-gas jets, and hydrogen flame, we have found that the three latter are about equal, and each is better than a soldering iron alone, but this latter is necessary for finishing in awkward corners.

Eventually the use of a simple electrical device will probably become popular for repetition work.

As previously mentioned, this means of connection still has many adherents. There is, however, a great disadvantage attached to it, viz., the risk of burning the tube owing to the intense heat necessary. That this burning and consequent weakening does take place can be easily shown by the results of tests carried out by us on a cantilever testing machine.

The tests were upon tubes which had been fixed into sockets and brazed or soft-soldered, and showed the decided dis-

advantage of the brazed joint from the standpoint of strength.

A further series of tests was carried out on the alternating stress machine, and these results were similar.

Another point may be mentioned with regard to these tests. In one test the result was poor in comparison with the others. This joint was "faked," the tube and socket being left dirty and improperly tinned, in consequence of which the soldered joint had no "life." Even under these conditions the joint held for 75,130 revolutions, as against about 4000 for the brazed joint. At this point the socket failed, due to the insecure fixing of the tube.

Another peculiar feature of this test was the heat generated in the brazed tubes due to the constant working of the molecules. The tubes commenced to warm up almost immediately, and, before they broke, the temperature of the tubes near to the points of fracture (i.e., near the socket) was about 120 deg. C., sufficient to cause the charring of any adjacent wood, whereas the soldered tubes remained quite cool until the last few minutes prior to fracture.

We are quite aware that in many places on aircraft structures brazing is permissible and good, but where any weakening of a member is likely to cause disaster, brazing should be carefully avoided.

#### Silver Soldering or Hard Soldering

The foregoing remarks as to brazing hardly apply to silver-soldering, as by this method a strong joint can be obtained without undue heat. We are not in a position at the moment to give any comparative figures of tests, but we should say that from the standpoint of tensile strength, silver-soldering is higher than soft-soldering, and very near to that of brazing. The heat necessary to perform the operation is lower than for brazing, and it is not likely to weaken any members if reasonable care is used. It is, however, a longer process, and the material used is very costly.

We may well ask ourselves, in these days, where we should be without some form of autogenous welding. The thousand and one articles that are built up of sheet metal welded together speak for themselves, and make us wonder how we ever got on without this useful engineering process.

Still, welding has its limits of usefulness, and if these are exceeded danger may be near.

In the early days of aeronautical engineering welding was often used in places and on parts where to-day it is "taboo," and such a method as welding tube to tube has dropped to a great extent out of favor, having been superseded by the more costly but better and safer engineering practice of jointing by means of machined or built-up tubular sockets.

Welding—by whatever means it is done—is always open to a certain amount of doubt, and though there are innumerable cases where this doubt as to the strength of a point is well covered, yet, owing to the hidden nature of the defects of welding and the possibility of burning and oxidization, present-day designers avoid it in any important member of an aircraft structure.

A most important rule introduced during recent years has been the suitable annealing of welded joints, and this rule should be adhered to whenever possible. Many will have noticed the brittleness of a welded joint before annealing or normalizing and the malleability of the same afterward.

On this point the writer discovered within the last few months a rather strange fact. We had occasion recently to make up some small lugs in which it was found that a certain amount of shortening took place as the result of the welding on of the arm. We have since noticed this shortening in other tubes, some of quite considerable length, where various fittings have been welded on at intervals, and so far we have not arrived at a satisfactory explanation.

#### Notes on Welding

The easiest method of welding is the butt joint, i.e., when two tubes are placed end to end and joined together to form one length or mitered together to form one piece. In such a case the surfaces to be welded are readily accessible, and the flame has freedom for doing its work.

A more difficult type of welding is that necessary when one tube has to be mitered to the outside of another tube, as

when forming a "T" lug. In this case the easily-melted end of the one tube has to be united to the outside surface of the other, and anyone who has had experience with welding will know how much more difficult it is to attack the hard outside skin of a tube or sheet than it is the edge.

In order to prove this point we carried out tests on tubes measuring 1 in. outside diameter by 20 gage, and 1 in. outside diameter by 16 gage—some being butt welded and others having an interposed tube of about the same diameter, to which the end of each tube was welded.

Comparative tests were made on a cantilever tube joined to the main member by welding, and a similar type of leading was also tested for a lug, with the tube fixed in place by welding.

The following were the results: Welded direct to tube, 335 lb.; welded into socket, 365 lb.

Welding is often harshly criticized as regards its ability to withstand vibration, but even in this respect we have found striking instances where the tube has broken before the joint.

Some time ago we tried an intermittent shock and vibratory test on a machine which gave a series of vibrations to the tube, the blows due to the "peg-cam" being 1400 per minute. In some cases the tube broke off without the welded joint suffering in any appreciable manner.

As regards welding of any description to be done on tubing, we do not advocate the use of tubing made from steel too high in carbon. A low carbon steel gives the better result, and it is also most essential that the phosphorus content of both tube and welding wire shall be low.

Wherever possible, we would suggest that the welding on of hinges and sockets to a main spar or post be avoided. To slot a tube, or soften it by welding, is unwise, and in place of any fixtures that at present demand such operations we recommend a sweated and pegged fitting.

In support of this some experiments were carried out by

our company in order to convince some of our friends of the advisability of following the course we have suggested. In one case a wiring lug was fixed on a main spar by welding, and in the other by sweating and pegging. Alternating tests on these tubes gave the following results: Welded, 5190 revs.; soldered, 8800 revs.

#### Rust Prevention

One further point remains to be mentioned. It is well known that a long life for any modern aeroplane is not expected. The present necessary wastage in aircraft is such that the question of internal rust and corrosion of the steel work is not of serious moment. The time is coming, however, when such matters will have to be seriously considered. For any post-war machines—especially if designed for general passenger traffic—the question of the length of life of all parts will be one of primary importance.

We have experimented with two or three methods of preserving from rust and corrosion, with fairly satisfactory results, and in the case of airship framework, subject as it is to salt water influence, we have used with fair success the "Cosletizing" process.

For soldered work, such as rudder and fin frames, we have instituted at our works a thorough system of washing and brushing in hot soda water to remove all traces of the "fluxite" or the flux, and we think this is most essential.

In conclusion, we would say that "the last word" in tubes and tubular structures has not by any means yet been spoken. With the increase in the size of machines, the constant and ever-increasing shortage of seasoned timber, the extended use of machines in future years in hot climates, with all the climatic effects on timber, the "all-steel" machine will undoubtedly soon become a reality and a necessity, and consequently the subject of tubes and tubular construction assumes increasing importance.

*A wind tunnel serves to determine the air resistance of different shapes of wings, struts, bodies, etc., the experiments being usually carried out by means of scale models*

Canada .....	One Year, 5.00
Foreign Countries .....	One Year, 6.00

To Subscribers—Do not send money by ordinary mail. Remit by Draft, Post-Office or Express Money Order or Register your letter.

### HORSELESS AGE SUBSCRIBERS

Subscriptions for the Horseless Age transferred to the subscription list of AUTOMOTIVE INDUSTRIES in the merging of the two publications will be completed in full by the weekly issues of AUTOMOTIVE INDUSTRIES to the dates of expiration shown on the record of the Horseless Age Co.

Owled by United Publishers Corporation, Address 243 West 39th St., New York; H. M. Swetland, President; Charles G. Phillips, Vice-President; W. H. Taylor, Treasurer; A. C. Pearson, Secretary.

Entered as second-class matter Jan. 2, 1903, at the post-office at New York, New York, under the Act of March 3, 1879.

Member of the Audit Bureau of Circulations.

Automotive Industries-The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

## The Vestibule School and Shop Training

**T**HERE are apparently two or more sides to the training question just as there are, or have been, to all other questions which have come up so far in the history of the world. Some manufacturers find that the vestibule school, or its equivalent, serves best for them as a means of developing the skilled operatives whom they must add from time to time to their working forces and others find, or believe they find, that the best, or at least satisfactory, results are obtained through training new employees in the shop under the direction of production foremen.

The users of each system of training advance an array of arguments which, standing alone, would convince any casual observer and when set against the arguments for the other system would apparently leave little or nothing to choose between them.

There is one point—it is a more or less general observation, perhaps, but it seems to bear on fundamentals—which apparently indicates that the vestibule school or the training department is based on sound logic. In such a school the chief business of the one charged with the instruction is to teach, and the chief business of the one sent there for instruction is to learn.

In the production department, on the other hand, the chief business of the one who does the instructing is to insure and secure output and the instruction of the beginner is a secondary or minor consideration. The desire of the latter to learn is in a measure counteracted by the inability of the former to teach, either through lack of natural aptitude, which is often the case, or through lack of time, which amounts to the same thing in the end, so far as results are concerned. In the separate school, however, the two principal factors—the desire to learn and the ability to teach—supplement each other, and this fact would lead to the anticipation of desirable results which could not otherwise be obtained.

It would, therefore, seem logical to expect when other things are equal—and they usually are—that the training of the vestibule school will be more thorough and more quickly accomplished than that done by the shop method.

## The Production Value of an Employee

**A** MANUFACTURER, in calculating the production value of a machine, considers what it will produce in quantity and quality per hour, per day and during a period of some considerable length. Many a machine has been discarded or has not been adopted even though its hourly output rate was high because its total output during a lengthy period was less than that of a slower machine which had the very desirable quality of regularity—of keeping everlastingly at it.

In calculating the production value of an employee the manufacturer is too prone to figure only on his output per hour or day. He is likely to overlook the fact—and in this day of labor scarcity and the high cost of labor turnover it is a most important fact—that it is not so much what an employee produces in one hour, in one day or even in one week, that counts, as what that employee produces during his working lifetime. And it is greatly to the advantage of the employer to see that the working lifetime of an efficient employee is as long as it possibly can be.

### Human Efficiency and Working Life

It is the employer's duty to himself, to the employee and to all of us who make up the population of this now sorely tried world, to use all available means and methods of making the employee's working life not only as long as possible, but as efficient as it is long.

They have learned much in Great Britain, since

the war began, about the output capacity of male or female workers—about human efficiency and how to obtain and maintain it. They had to learn it or lose the war. In spite of increased hours of labor production fell off. They thought it was *in spite*, but they found it was *because*. They discovered that within certain limits, which were considerably below what had formerly been considered the possible low limits for maximum production, the lessening of the hours of labor per week actually resulted in an increased output. They learned some surprising things along this line.

They learned that the working lifetime of an employee is a production unit that must be used in figuring total output. They learned that this lifetime can be varied in length and in total average efficiency by the conditions under which the worker works and lives.

They learned that the worker's health is something that has a decided commercial value, that without healthful conditions in the shop and in the worker's home both the worker's and the employer's best interests suffer. They learned, as it was expressed in a summarized report of the British Health of Munition Workers' Committee, that "without health there is no energy, without energy there is no output," and we might add, without output there are no profits for the manufacturer.

Welfare work well done pays real dividends, and pays larger ones now than ever before.

## A Scientific Headlight Law

IN New York State there now is a definite method, a prescribed legal procedure, for determining what is, or rather what is not, a glaring headlight. There is no guesswork about it; no opportunity for the local policeman or Justice of the Peace to exercise his own peculiar judgment as to what objectionable glare is, for glare is or isn't, legally, according to a fixed standard which has recently been announced by the Secretary of State under authority conferred upon him by an amendment to the State Highway law. It is possible to tell exactly in any given case by means of scientific measuring instruments whether or not the law is complied with.

For the first time in the history of headlight legislation, nothing is left to individual opinion, and this means that for the first time also car manufacturers, lens makers, dealers and car owners know, so far as one state at least is concerned, just what requirements they must meet and how they can positively meet them. A careful study of the New York law and the adopting of its provisions by other states should be strongly advocated by all with even the smallest interest in the matter.

Besides being entitled to congratulations upon being the first to standardize headlight requirements scientifically, New York may also be congratulated upon the manner in which the requirements adopted were worked out. They are not the result of the usual legislative methods of procedure, but of the research work and investigation of competent engi-

neers. The Secretary of State, acting under the provisions of the amendment to the highway law, called to his assistance representatives of the Society of Automotive Engineers and of the Illuminating Engineering Society, who conducted a number of elaborate tests, as recorded in AUTOMOTIVE INDUSTRIES at the time, and finally put their recommendations into the form of specifications for standard headlight tests, which were adopted as official.

The progress toward scientific legislation and law enforcement indicated in this case is worthy of more than passing notice. When the law makers and administrators seek the help of those who know of what they speak, another ray of optimism is projected into the future.

## School Teachers as Shop Workers

REPORTS received from a number of manufacturing plants indicate that a fairly large number of women school teachers prompted by patriotic motives or the desire to earn an extra bit of money during their otherwise idle months are seeking employment in industrial establishments as operatives to replace men who have gone into government service.

The kind of woman school teacher who would seek employment of this kind is very likely to prove to be a most excellent operative after a comparatively short training period. Certainly she would bring to the job a degree of intelligence above the average of those who usually fill it. While she works she should be able to produce at as high a rate as conditions would permit and by example, at least, should have a good effect on the others with whom she works.

She will work hard, as well as intelligently, while the job is new, at any rate, and while she works she will undoubtedly be an admirable employee. But she is a transient. She will go back to her old work as soon as the schools open in the fall. She must be replaced and therefore cannot be counted on as a regular contributor to industrial production. About as soon as the employer finds that she is an exceptional employee she will leave him unless he can persuade her that an industrial life will pay better than a life of teaching, and in some cases it might be not only possible but desirable to do so.

And here's a thought. With the possibility pretty definitely established as a probability that our industries will hereafter employ a much larger proportion of women than they did in the pre-war days, there are opportunities for advancement to positions of considerable responsibility, and proportionate reward, opened to women of the right caliber, to women who have executive ability added to the pluck and determination which prompted them to take up even, as they thought, temporarily, a radically new line. It seems highly probable that such timber may be found among the school teachers who are filling in their spare time by working as operatives in industrial plants. Consider them carefully, Mr. Manufacturer, with this in mind.

## Airplane Production Satisfactory

### Senate Committee Finds Excellent Progress Being Made in West

DETROIT, July 10—Airplane production in the middle Western territory is proceeding satisfactorily. The Senate investigating committee, after leaving the middle West, was greatly pleased at the progress which is being made in the factories in Dayton, Detroit and other centers in this vicinity.

This feeling on the part of the Senate investigating committee is reflected largely by manufacturers who now feel that they have set their pace and that they can see daylight in the way of production in Liberty engines and planes.

The Packard Motor Car Co. still leads in the production of Liberty engines. This concern just fell short of 800 engines during June by a very small margin. Eight hundred was the goal which was set for this month.

The production at the Lincoln Motor Co. is second, with an average of very close to 17 per day. The ultimate capacity of the Lincoln Motor Co. with its newly designed equipment will be about 70 Liberty engines per day, and it is expected that this will be reached during the coming winter.

The Ford Motor Co. has fallen far short of the rather hasty prediction given by Henry Ford during the spring. At that time he stated in his interview given out in Washington that about July 1 the Ford Motor Co. would be producing 100 per day. This was realized to be impossible by those who had had experience in airplane engine production, and the fact that Ford is in production at all is regarded by them as a big accomplishment in spite of the fact that the production falls far short of the mark set by Henry Ford at that time.

The Ford plant, according to best estimates, is turning out 2000 Liberty engine cylinders per day, and is nearing a production of complete engines of 10 per day. This is, furthermore, a remarkable accomplishment in view of the fact that the production heads of the Ford Motor Co. have been largely concerned with rapid production of the Eagle boats, or submarine chasers; one of these was ready to launch on July 4, and they will soon be coming through in a constant string, and eventually at the rate of one per day.

The Marmon company is not yet in production on Liberty engines, but shortly will be. The tooling-up progress is being pushed rapidly, and parts of the engine are ready to be in production. The complete

engines, however, are not coming out of the factory as yet, although it is a matter of but a few weeks before the Nordyke & Marmon Co. will be added to the list of Liberty engine producers.

The Cadillac Motor Car Co. is now in production on complete engines. This concern which was one of the first to conquer the difficult connecting-rod manufacturing problem on the Liberty engine, is now turning out, in connection with Buick, complete sets of parts and assembling them. The rate of production is not stable enough to set a fixed average per day, but soon will be, and probably in a few weeks a production of five per day will be reached. This will be increased rapidly as time goes on, so that this concern will be a fairly large producer of Liberty engines late in the fall or early in the winter.

The Trego Motors Co. is turning out a complete Liberty engine every day or two.

There have been reports that the Navy has taken a large percentage of Liberty engines. This is true, the percentage being estimated at from 40 to 60 of the total. With the rapid production of the De Havilland bombing plane demanding Liberty engines for equipment, the engine production will have to be speeded up to take care of both the navy and army demands. The Navy type has proved exceptionally satisfactory, and it has not been confronted with the problems of carburetion at high altitudes which has been one of the difficult kinks to solve in the Army plane.

The Liberty engine carburetor system on the Army types will have to be modified slightly for the extreme altitude. Advices have come from the staff of the American Expeditionary Forces to the effect that the carburetion system, particularly as concerns the gasoline feed, will have to be altered to eliminate fire danger due to spitting back while cold.

It has been practically decided to abandon all pressure feed of gasoline on the West front, due to the fact that a bullet through the gasoline tank renders the gasoline feed system inoperative and for this reason gravity feed will have to be substituted, or some other method which is not susceptible to destruction by punctures.

The Fisher Body Co. is pushing along rapidly with its plant and the 10 acres originally designed for have just about been completed. In addition, there will be more buildings added to take care of the enlarged battle plane production program.

The new plane which has been designated at the Packard plant under the auspices of the French Commission has been flown and has been declared a success. Captain Flachaire of the French Flying Corps, who has been in this country on propaganda work, giving exhibition flights with his Spad in different cities throughout the country, was one of those to fly the new type of machine and expresses himself as highly satisfied with it. In fact, Captain Flachaire was able to successfully execute a tail spin quite close to the ground with the machine, after having been up only a short time. This is a two-seated battleplane particularly adapted to the Liberty engine and is a modification of the design which has proven highly successful with the Bugatti engine.

## Passenger Car Tax May Be 10%

### Treasury Department Submits Tax Proposals—Gasoline Impost Not Likely

WASHINGTON, July 10—It is probable that a 10 per cent retail sales tax on passenger cars will result from the tax recommendations made yesterday by the Treasury Department to the Ways and Means Committee.

It is unlikely that the proposal to tax gasoline will be taken seriously.

The car taxes suggested include both retail sales tax to "label the taxed article as a luxury and serve notice that the Government's ban is honest," and certain manufacturers or producers taxes, as follows:

Retail sales tax:  
Twenty per cent on passenger cars.  
Twenty per cent on trailers.  
Twenty per cent on truck units.  
Twenty per cent on motorcycles.  
Twenty per cent on tires for automobiles, motorcycles and bicycles.

A license tax on passenger cars based on horsepower as follows:

Producers or manufacturers tax:  
Twenty-three h.p. or less.....\$15  
Twenty-four to thirty h.p..... 25  
Thirty-one to forty h.p..... 40  
Over forty h.p..... 50  
To be paid by wholesale dealers:  
Ten cents per gallon on gasoline.  
To be paid by consumers:  
Twenty-five per cent of the wages paid to domestic chauffeurs.

The Ways and Means Committee was both startled and amused by the suggestions. While no definite conclusions were reached following a day spent in going over each item mentioned, it was plain that the majority of the members are in favor of a high increase in the tax on passenger cars, probably to 10 per cent.

At the same time the majority are against a tax on gasoline for the reason that numerous inequalities would result. It was pointed out that motor trucks performing valuable services in relieving transportation and passenger cars engaged in utilitarian work would be unjustly taxed. If a scheme could be devised so that gasoline used for pleasure purposes could be taxed separately, it would find favor but since this plan is practically impossible, it is felt unwise to place a wholesale tax on it.

The Committee returned the list to the Treasury Department with a request for an estimate of the taxes it would yield. It is believed that in view of the greatly decreased consumption that would accompany such exorbitant taxes that the Treasury Department will find it difficult to furnish an accurate estimate of the revenue that would result.

# Automotive Industries □

## Reclassify Freight; Rates Changed

### Would Increase Passenger Cars 10% and Reduce Trucks— Permit Mixed Loads

NEW YORK, July 10—Under the Consolidated Classification, which is now in print and ready for filing before the Interstate Commerce Commission, freight rates for passenger cars will be increased 10 per cent on Western railroads, and rates on trucks will be considerably reduced.

Heretofore passenger cars and trucks have been placed in the same classification by railroads and have paid the same rates. Under the Consolidated Classification these are separated, and whereas trucks heretofore have been rated double first-class rates in l.c.l. lots and first-class rates with a minimum of 10,000 lbs. in c.l. lots, under the Consolidated Classification rates charged will be 1½ times first-class rates l.c.l. and for c.l. second-class, with a minimum of 12,000 lbs. for a 36-ft. car.

If the Consolidated Classification becomes effective, rates on passenger cars will be the same as those at present prescribed in the Official Classification on l.c.l. shipments. This is 2½ times first-class at actual weight, with a minimum charge on 5000 lbs. each at first-class rate; double first-class rate when crated and 1½ times first-class rate when boxed. Rates for c.l. shipments are increased to 110 per cent of first-class with a minimum of 10,000 lbs. This represents an increase of about 10 per cent.

A further change proposed by the Consolidated Classification would permit the mixing of various articles at carload rate. When this is done the carload will be rated at the highest rate of any commodity in it, with the carload minimum rate the highest provided for any article in the carload.

Hearings on the new classifications are to be held in Boston, Aug. 1; New York, Aug. 8; Chicago, Aug. 12, and in Omaha, Portland, San Francisco, Denver and Fort Worth at subsequent dates and at Atlanta on Sept. 19.

### Tracy To Conduct Official Fuel Consumption Tests

NEW YORK, July 10—Joseph Tracy, consulting engineer, has been appointed consulting engineer of the Bureau of Oil Conservation, United States Fuel Administration by W. Champlin Robinson, who is Director of Oil Conservation. Mr.

Tracy will conduct sanctioned tests of automobiles, motor trucks, and other apparatus for the purpose of securing greater fuel economy. These tests will be sanctioned by the Bureau of Oil Conservation. This practical testing work is being concentrated under the complete direction of Mr. Tracy. The definite plans as to the exact nature of road tests have not been decided upon.

### Ford Will Reduce Production

DETROIT, July 9—Nothing has been definitely decided upon but indications point to a sharp cut in the production of passenger cars and trucks of the Ford Motor Co. It is expected that the output of the factory will be brought down to 375 passenger cars and 450 trucks a day by Aug. 1. This is necessary because of the immense amount of government work handled at the Ford factory. It is reported that the government has suggested this action. The company is now turning out only 1000 cars daily as compared with 1600 less than 30 days ago. This last figure represents only 50 per cent of its greatest normal production.

### Government Control of Sulphur

WASHINGTON, July 10—The War Industries Board has taken over control of production and distribution of sulphur materials and W. G. Woolfolk has been made chief of the section in charge of sulphur and pyrites. Sulphuric acid is used to a certain extent in the automotive industries for pickling baths but it is not anticipated that there will be any difficulty in obtaining this material. Sulphur is an indispensable article in the vulcanization of rubber, about one-fifth of the weight of crude rubber being required. It is understood that the rubber industry, which is looked upon as an essential industry by the War Industries Board, will be protected in its requirements.

### Restriet Graphite Crucible Imports

WASHINGTON, July 11—The importation of graphite crucible has been restricted by the War Trade Board after July 15. The action was taken when it was shown that there were adequate supplies in the country.

### Marmon and Hall Going to France

DETROIT, July 11—Major Howard Marmon, Colonel Hall and Charles H. Willard, chief engineer of the Aero-marine Plane & Motor Co., will form a Government commission to obtain the latest military information on aircraft. They will leave shortly for France and England.

## No War Revenue Tax on Exports

### Treasury Department Rules Cars Shipped Abroad Can- not Be Taxed 3 Per Cent

NEW YORK, July 10—The Commissioner of Internal Revenue of the Treasury Department has ruled that manufacturers of automobiles can export cars without paying the 3 per cent War Revenue Tax which heretofore has been payable, and has virtually ruled that it is unconstitutional to tax any article which is exported from the United States.

The ruling is based on an opinion of the Attorney-General of the United States, which holds that the 3 per cent War Revenue Tax does not apply to articles sold in foreign commerce by any one of the four following methods:

- 1—Articles shipped by a manufacturer to an agent in a foreign country and sold there by the agent;
- 2—Articles shipped by a manufacturer to a foreign purchaser to fill orders received by an agent in a foreign country;
- 3—Articles shipped by a manufacturer to a foreign purchaser to fill orders received by the manufacturer in the United States;
- 4—Articles shipped by a manufacturer to a foreign purchaser to fill orders solicited by mail and received by mail from a foreign purchaser.

### Applies to Shipments to Foreign Lands

This ruling applies only to articles shipped from any state in the United States to a foreign country. The taxes apply, however, to articles sold in foreign countries by a manufacturer located in a territory or elsewhere in the United States other than in a state, and also to articles sold in commerce between the United States and any of its island or other possessions except the West Indian Islands acquired from Denmark.

In explanation of the decision, which is supplemental to Regulations No. 44 approved May 31, 1918, it is pointed out that whereas Section 600 of the Act of Oct. 3, 1917, imposes a War Revenue Tax of 3 per cent on motor cars and other articles, Section 9 of Article 1 of the Constitution of the United States provides that "No tax or duty shall be laid on articles exported from any state."

The Treasury Department has issued in pamphlet form a revision and summary of its various rulings covering the 3 per cent war tax and referring particularly to Articles 1 to 10 inclusive.

## New Rules Govern Export Licenses

After July 15 to Be Regarded As Having Been Used in Period of Validity

WASHINGTON, July 8—After July 15, new rules will be operated by the War Trade Board governing the expiration dates of export licenses. On and after July 15, 1918, export licenses will be regarded as having been used within the period of their validity:

(a) If the through export bill of lading is issued and signed on or before the expiration date of the license and subsequent to Oct. 9, 1917; or

(b) If the ocean bill of lading is dated on or before the expiration date of the license; or

(c) If the dock receipt is dated on or before the expiration date of the license, and the ocean bill of lading covering the same shipment is dated not later than 30 days after the expiration date of the license; or If the dock receipt is dated on or before the expiration date of the license and prior to July 15, 1918, and the ocean bill of lading covering the same shipment is dated not later than 30 days after July 15, 1918.

(d) If the railroad notice of arrival issued at the port of exportation is dated on or before the expiration date of the license, and if the ocean bill of lading covering the same shipment is dated not later than 10 days after the expiration date of the license; provided, that the provisions of this paragraph (d) shall apply only when the merchandise is exported on vessels loading at railroad docks, where dock receipts as provided in paragraph (b) cannot be issued by the vessel or its agents.

On and after July 15, 1918, shippers shall prepare and deliver to the railroad agent issuing a through export bill of lading one additional copy of such bill of lading, which copy will be mailed by the issuing railroad agent to the Bureau of Exports, War Trade, Washington, D. C., after there has been noted thereon the port of exit through which the shipment will pass.

Shippers who have goods in transit on through export bills of lading issued subsequent to October 9, 1917, and prior to July 15, 1918, and which goods have not actually cleared from the United States prior to July 15, 1918, must mail immediately to the War Trade Board, Bureau of Exports, Washington, D. C., a copy of such through export bill of lading, giving the port of exit from the United States as well as the number of the export license under which the shipment was made so that the War Trade Board may arrange clearance for such shipments.

### Studebaker Adds a Sedan

SOUTH BEND, IND., July 8—The Studebaker Corp. has added a sedan to its series 19 models, and this will be fitted to both the four and six-cylinder chassis, the four listing at \$1,685 and the six at \$2,185. There is practically no difference in the two bodies, both seating five passengers. Upholstery is high

grade cloth laid in parallel pleats, and equipment includes a dome light, silk roller curtains, door locks and a three-piece windshield with adjustable visor. The finish is Studebaker blue with the chassis and upper half of the body black.

### Ferro-Silicon Output Increases

WASHINGTON, July 6—Increased production of ferro-silicon, electrodes, phosphorus, chlorine and abrasives has resulted through a general supervision of the electrical power provided by the Niagara Falls, according to a report just issued. The supervision has extended over all the power generated or imported by the Hydraulic Power Co. and the Niagara Falls Power Co., and which has been distributed chiefly to war industries. Of all the power available, the war industries have received 85.29 per cent.

### Permit Magnesite to Come In

WASHINGTON, July 5—Importation of magnesite will be allowed under the new War Trade Board backhaul provision, which permits the importation of magnesite when shipped return cargo from Europe and the Mediterranean coast of Africa, and when shipped from convenient ports where loading can be done without delay. Importations of manganese ore from Asia and Australasia have, by another ruling, been prohibited as to ocean shipments made on and after July 20, 1918; and, to make this ruling effective, all outstanding licenses for the importation of manganese from those countries have been revoked as to ocean shipment on and after July 20, 1918.

### M. A. M. A. Washington Office Closed

WASHINGTON, July 6—The office of the Motor and Accessory Manufacturers' Association in this city has been discontinued, as forecast in last week's issue. A. W. Copland, who was the special representative for the association here, and who will continue as chairman of its War Service Committee, has returned to his business duties in Detroit. Mr. Copland is the head of the Detroit Gear Co.

## Production of Coal Down Slightly

Bituminous Drops 5% From Last Week, But Is Ahead of Output Last Year

WASHINGTON, July 6—Bituminous coal production for the week ended June 22 was 12,016,000 tons, a decrease of 610,000 tons, or 5 per cent less than the preceding week, and an increase of 701,000 tons, or 6 per cent, over the corresponding week of 1917. Despite the sharp decline compared with the preceding week, the Fuel Administration indicates that the mines have adjusted their stride to a basis of 12,000,000 tons per week, and that this output is not far below the average necessary to provide the tonnage to meet the estimated requirements of the country. Falling off in production was reported from all producing centers, Ohio and Alabama decreasing the most.

Anthracite shipments for the week of June 22 amounted to 41,170 cars, a decrease of 700 cars from the preceding week, or 1.9 per cent loss.

The Fuel Administration states that the record production of 12,626,000 tons for the week ended June 15 was accomplished without any enlargement of the working forces at the mines. Output was increased by individual efforts of the men.

During this week the mines operated up to 79.7 per cent of their full time output. The percentages of full lost time are accounted for as follows: Car shortage, 10.9 per cent; labor shortage, including strikes, 4.7 per cent; mine disability, 3 per cent; no market, 0.3 per cent; all other instances, 1.4 per cent.

Insufficient car supply hampered production in Illinois, Ohio, western Pennsylvania, West Virginia and the western states. Illinois reported labor shortage. Car shortage based upon full time capacity ranged as high as 20 per cent in some districts.

Type of sedan body which has been added to the Studebaker line. It is supplied on both the four- and six-cylinder chassis

## Coal for Passenger Cars 25%

Use to Be Restricted Regardless of Quantity Stored—100% for War Work

WASHINGTON, July 8—Passenger car makers will be allowed to use only 25 per cent of the coal allotment of the 1917-18 period in the 1918-19 period, regardless of the quantities of coal they have purchased now and stored away.

Manufacturers engaged in war and passenger car manufacture will receive 100 per cent coal supply for the war work, but will be allowed the 25 per cent allotment only for passenger car manufacture. Many of the manufacturers have made expenditures of money, used considerable space for storing large quantities of coal this spring, in the anticipation that the Fuel Administration would allow them to use all the coal they buy now for passenger car manufacture next winter. The above ruling was made by F. W. Noyes, Director of Conservation of the United States Fuel Administration, to AUTOMOTIVE INDUSTRIES to dispel these hopes. It was pointed out to the Fuel Administration that:

(a) The Administration requested manufacturers to buy their coal now to relieve the railroads next winter.

(b) Many manufacturers heeding this request are making expenditures of money and using important factory space to store the coal.

(c) Many manufacturers are securing enough coal to provide them with a 100 per cent allowance for passenger car use.

(d) Other manufacturers are not heeding the request of the Government to buy coal now, and it would be a great injustice if the Administration refuses to allow those manufacturers with foresight, who buy their 100 per cent coal needs now, to use the full coal allowance next winter.

(e) It would be a great injustice to the foresighted and patriotic manufacturer who buys his coal now and who devotes an outlay of money and use of space for that purpose to be forced next winter to either have his coal lie idle or be obliged to divide it with those manufacturers who do not display the foresight and are not willing to spend the money or use the necessary space to buy coal now.

Regardless of the injustice, and regardless of the fact that manufacturers that buy their coal now are only heeding the United States Fuel Administration requests, the above rulings were made by Director Noyes.

### Benford Develops Golden Eagle Spark Plug

A new design of spark plug, especially adapted for use on tractor and truck engines, has been placed on the market by the Benford Mfg. Co., Mount Vernon, N. Y. It is of substantial construction,

and an extensive test, covering 17,000 miles in a tractor engine, has shown it to be well adapted for the purpose for which it was designed. The Golden Eagle plug is being made in several different sizes, viz.,  $\frac{7}{8}$ -in. regular;  $\frac{3}{4}$ -in. regular; metric,  $\frac{7}{8}$ -in. long,  $\frac{1}{2}$ -in. long;  $\frac{3}{4}$ -in. long and  $\frac{1}{2}$ -in. extra long. This large assortment of sizes permits of meeting the requirements of all different types of engines.

The Golden Eagle plug is of the mica-insulated type. There is an inside layer of sheet mica, wrapped tightly around a tapered rod. By a special method employed, it is possible to wrap the mica tighter around the rod than is usually the case, and it is claimed that at least one-third more mica is gotten into the same space than by ordinary methods. This extra tight winding of the mica is claimed to absolutely prevent short-circuiting by oil. As is well known, when the mica is loosely wound, oil will seep into the interstices and soak through the mica core, thus short-circuiting the plug.

To the bottom of the tapered central rod is welded a pure nickel electrode, and a pure nickel side electrode runs from one side of the shell to the other, this latter electrode being curved around the central electrode in V fashion, the same as in the Golden Giant. The bottom of this plug is closed by what is generally referred to as a "baffle plate." There are four holes in this baffle plate, through which the combustible charge and the burning gas can pass in and out respectively. The object of the baffle plate is to keep oil out of the spark plug chamber, thereby preventing the plug from fouling. It is also claimed that the baffle plate confines the heat to the spark plug chamber, and that the resulting high temperature will burn any oil that may get into the chamber, thus making carbonization practically impossible. Only one gasket is used in the plug. This is  $\frac{5}{64}$  in. thick, and is made of copper. It is claimed to hold the strongest compression. Stock plugs will be provided with double lock washers. The retail price of the Golden Eagle plug is \$2.

### First Wolverine Truck Out

DETROIT, July 8—The first Wolverine  $1\frac{1}{2}$ -ton truck of the American Commercial Car Co. is expected on the market the last of this week. The retail price will be \$1,825. The company was organized last year by H. C. Wiedeman and associates, who purchased a large manufacturing plant at the corner of Gratiot Avenue and the Detroit Terminal railroad, comprising about five acres of ground together with three large factory buildings and machine shop equipment.

## Canadian Exports Need License

Individual Permits for Non-Canadian Products—Ban Graphite for 1918

WASHINGTON, July 8—Hereafter all shipments of articles of non-Canadian origin imported from Canada and Newfoundland will require individual import licenses similar to those required for imports from other countries. This ruling by the War Trade Board is made to prevent evasions of the general import regulations. Some concerns have been making sea shipments to Canada of restricted commodities, and then import through Canada by rail to the United States. Goods of Canadian origin will be granted entry but will require individual import licenses.

WASHINGTON, June 28—The War Trade Board has modified the export conservation list effective June 28, 1918, as follows:

Individual licenses for the export of fuel have to be secured for marine engines and parts of more than 60 hp.

Individual licenses must be secured for the export of logs, including timber round, hewn, sawed, sided or square, and for lumber manufactured in all dimensions and sizes for commercial uses, including wood suitable for gun stocks, airplane propellers, blades, veneers, for airplane and hydroplane bodies, airplane and hydroplane frames and for ordnance construction, and for wood handles for tools necessary for war supplies.

### Ban Graphite for All of 1918

WASHINGTON, July 2—The importation of graphite or plumbago has been extended to be effective for the entire calendar year 1918 by the War Industries Board. Under the List of Restricted Imports No. 1 this restriction was made absolute until July 1 of this year, the possibility of importing not to exceed 5000 long tons for the remainder of the year being left open should investigation prove that stocks in this country were inadequate to meet the home requirements for the entire year. As a result of the investigation, it has been found that present stocks, together with the home production, suffice to meet requirements until well into 1919. The restriction has therefore been continued and the Bureau of Imports has been instructed to issue no licenses for the importation of plumbago or graphite for the rest of the calendar year.

Section showing construction of Benford Golden Eagle spark plug

## Favor Government Airplane Plant

### Congress Will Probably Pass Bill for \$100,000,000 Air- craft Corporation

WASHINGTON, July 8.—The bill demanding the organization of a Government-owned aircraft corporation proposed recently by Senator Chamberlain, and told of in a past issue of AUTOMOTIVE INDUSTRIES, will probably pass Congress. This bill, which calls for the creation of a corporation directing production of aircraft equipment or materials will be formed under the laws of the District of Columbia with a capital stock of \$100,000,000.

According to Congressman Kahn, one of the chief objects of the corporation will be efficient division of spruce to the Allies. Great Britain takes eleven twenty-fourths, France one-sixth, Italy one-eighth, and the United States one-fourth of the output, and it is believed that the corporation should be organized, and each of the Allies put upon debentures of this Government for the amount of lumber they are receiving from it so that when the time of settlement arrives nations will get returns from their salvage in proportion to the stock they are allotted in the corporation. The United States Government will at all times be the majority stockholder, and the minority stock it is proposed, will be sold to the various allied governments.

The corporation will to some extent purchase all the existing plants now manufacturing aircraft, but it is anticipated will in the main co-operate with existing plants rather than purchase them or build new ones.

The corporation, which will be under the control of the Aircraft Production Board, will be similar to the Emergency Fleet Corporation, and will function with regard to the production of airplanes as the Emergency Fleet Corporation operates in regard to building ships.

Congressional debate regarding this bill developed the fact that the Wright-Martin Co., Dayton, shipped 421 planes up to June 22, and sent out 36 carloads in one day from Dayton. Some of the congressmen, told by Congressman Kahn, that they were little "behind the time" endeavored to bring up the subject of the efficiency of the Liberty engine, and the results of the expenditures of the \$640,000,000 appropriated last year for airplanes.

#### N. A. C. C. Endorses Work of N. A. D. A.

DETROIT, July 10.—At the regular monthly meeting of the National Automobile Chamber of Commerce, held here to-day, efforts of the National Automobile Dealers' Association to assist the government by reducing the amount of free service given by dealers were given the support of the chamber. Drive-aways from factories are increasing and the production of trucks has gone up 100 per

cent. The following committee chairmen were appointed: Patents, C. C. Hanch (Studebaker); Motor Truck, Windsor T. White (White); Legislation, H. H. Rice (Chevrolet); Good Roads, Roy D. Chapin (Hudson); Traffic, William E. Metzger (Columbia); Electric vehicles, W. C. Anderson (Detroit); Handbook, C. H. Pelton (Maxwell); Exports, J. Walter Drake (Hupmobile); War Service, Hugh Chalmers (Chalmers); Standardization, C. W. Churchill (Winton).

#### Reduce Airplane Mail Rate

WASHINGTON, June 29.—Beginning July 15 the postage rate for airplane mail between New York and this city, now 24 cents per ounce, will be reduced to 16 cents for the first ounce and 6 cents for each additional ounce. This is a 6-cent rate, plus the usual 10 cents for special delivery. The reduction is expected to greatly increase the use of the air mail service.

#### Six Deaths at Aviation Fields

WASHINGTON, June 28.—Six deaths resulted from aviation accidents at the aviation fields in this country during the week ending June 15. Summary is as follows:

Barron Field, Everman, Tex.....	1
Carlstrom Field, Arcadia, Fla.....	1
Ellington Field, Houston, Tex.....	1
Kelly Field, San Antonio, Tex.....	1
Payne Field, West Point, Miss.....	1
Scott Field, Belleville, Ill.....	1

#### Airplane Investigators Go to Dayton

WASHINGTON, July 8.—Charles E. Hughes, Attorney-General Gregory and Assistant Attorney-General Fitts, who are investigating the aircraft situation, leave to-day for Dayton to gain first-hand information at the factories there.

#### Solid Tires to Be Standardized

AKRON, July 8.—At a recent meeting of the War Service Committee, Division of Solid Tires, the following classification of pressed-on solid tires was adopted tentatively:

Class "A"	Class "C"	Class "D"	Class "E"
Permanent Standard	To be discontinued Nov. 1919	To be discontinued Nov. 1918	To be discontinued at once
32 x 3½	32 x 2½	42 x 5	34 x 7
34 x 3½	32 x 3	34 x 6	34 x 8
34 x 4	34 x 3	42 x 6	40 x 8
36 x 4	36 x 3	42 x 7	34 x 10
34 x 5	36 x 3½		42 x 10
36 x 5	32 x 4		36 x 12
40 x 5	38 x 4		42 x 14
36 x 6	40 x 4		
40 x 6	38 x 5		
36 x 7	38 x 6		
36 x 8	38 x 7		
36 x 10	40 x 7		
40 x 10			
40 x 12			
40 x 14			

Although the above classification has not been finally adopted, it is entirely probable that it will be at a later meeting, the definite date of which has not been announced.

## Deliver 4495 Planes to Government

### All for Elementary Training— 820 for Advanced Training Have Also Been Received

WASHINGTON, July 5.—Four thousand four hundred and ninety-five elementary training airplanes were delivered to the United States Government by manufacturers in this country up to June 8. Eight hundred and twenty advanced training airplanes were delivered up to Jan. 8. This information, together with other data, was submitted to Congressman S. H. Dent, Jr., by Secretary of War Baker this week. The further information regarding aviation included: The average weekly production of advanced training planes during April was 22; during May, 45½; week ending June 8, 78.

To June 8, a total of 286 combat planes were delivered. The weekly average of this type of machine in April was 5; in May, 38; week ending June 8, 80.

More than 2000 Liberty engines have been delivered to the Army and Navy. The average weekly production in April was 96; in May, 143, and in the first week of June, 115.

Thirty-seven thousand two hundred and fifty machine guns were delivered for use on airplanes before June 8.

#### Airplane Bombing Demonstrated

WASHINGTON, July 11.—Airplane bombing, airplane bomb flares and other trench warfare was successfully demonstrated in an exhibit held here yesterday by the trench warfare section of the engineering division of the Ordnance Department. The display included salvos of grenades, barrages, drop bombs, trench mortars, high explosives, gas and pyrotechnic signals. A De Havilland plane equipped with two Liberty engines, dropped four demolition demonstration bombs from an altitude of 2000 ft. aiming at a target 30 ft. in diameter and striking within a radius of 200 yards each time. The bombs, which are one-fourth normal effectiveness, tore holes 10 ft. deep and 30 ft. in diameter.

Airplane flare bombs used to light cities to be bombed were also exhibited. They are 36 in. in length and 8 in. in diameter and contain a parachute which suspends them in the air after they are released. They throw a light of 350,000 cp. over a radius of 2 miles. Flares used to guide night bombers to their hangars were also displayed and created a light as powerful as daylight over a radius of 300 yards. Various pistol rocket signals, used to guide or signal night bombers by throwing various colored lights carried by small parachutes into the air were shown. These are used by aviators on their return and at the hangars.

Another demonstration was of incendiary bombs, which, dropped from an altitude of 2000 ft., started huge fires in the fields.

## Exports Show Drop of 22%

Figures for May, 1918, Only  
Half Those for May, 1917  
—Trucks Increased

1918				
Cars	Value	Trucks	Value	Parts
May...2,801	\$2,907,390	866	\$1,958,603	\$2,859,496
April...6,104	3,958,560	655	1,392,125	4,004,383

1917				
May...6,725	5,189,980	1,764	3,216,620	2,715,796

WASHINGTON, July 10—Exports of passenger cars, trucks and parts during May amounted to \$7,725,489. This is 22 per cent less than the April total and 48 per cent less than the amount exported during May, 1917. The chief drop came in passenger cars. Only 2801, valued at \$2,907,390, were shipped during May as compared with 6104, valued at \$3,958,560, during April. During May, 1917, 6726 cars, valued at \$5,490,509, were shipped, which is more than twice as large as the May, 1918, figure.

Commercial car exports, on the other hand, showed an increase over the April figure. In May, 866 trucks valued at \$1,958,603 were shipped as compared with 655, valued at \$1,392,125, in April. The May total is smaller than that of May, 1917, when 1764 trucks worth \$3,222,807 were exported.

One airplane was shipped as compared with 24 during May, 1917, and none in April. The value of airplane parts increased from \$359,436 in April, 1918, and \$513,104 in May, 1917, to \$771,673 in May, 1918.

Of the 2801 passenger cars shipped 733 went to Canada. The second largest

purchaser was Australia, who received 199. Cuba came third with a total of 181. The commercial cars went chiefly to the United Kingdom, France and Canada.

### Overland Prices Increased

DETROIT, July 10—The Willys-Overland, Toledo, has advanced the prices of all its models, effective July 16, as follows:

Model	Old Price	New Price
T. touring.....	\$850	\$895
roadster.....	850	895
90, country club.....	875	925
sedan.....	1340	1385
panel delivery.....	865	895
express delivery.....	840	875
85-4 touring.....	965	1025
roadster.....	965	1025
1200-lb. delivery.....	975	1075
85-6 touring.....	1195	1300
roadster.....	1195	1300
85-6 coupe.....	1420	1550
sedan.....	1620	1720
89 touring.....	1450	1525
club roadster.....	1450	1525
38-4 touring.....	1625	1650
coupe*.....	2275	2600
sedan*.....	2325	2650
limousine*.....	2425	2750
38-8 touring†.....	2100	2500
limousine†.....	2900	3300
coupe†.....	2770	3175
sedan†.....	2800	3200

\*Include 5-inch cord tires.

†Include 5 wire wheels and 5-inch cord tires.

### Rainier Adds 1½-Ton Model

NEW YORK, July 10—The Rainier Motor Corp. will begin shipments of a new 1½-ton truck styled R-6 in the latter part of July. The chassis price has been fixed at \$1,790 f.o.b. the factory in Flushing. This model will have a Continental 3½ x 5½ in. engine, with governor, Brown-Lipe clutch and transmission and worm-driven rear axle. The wheelbase is 133 in. and the tire equipment is the Firestone solid pressed-on type, 34 x 4.

## Big Spurt in Rubber Imports

Nearly 8000 More Came in During June Than May—Figures for Half Year

NEW YORK, July 10—Imports of crude rubber took a big spurt during the month of June, an increase of 7836 tons being shown over the quantity which came in during May. During the first six months of 1918 the total amount imported was 99,468 tons. This is 11,387 tons more than were imported during the first six months of 1917.

The big increase shown during the month of June probably is due to a certain extent to anticipation of the action of the War Trade Board in limiting imports. The quantity which is to be allowed to come in during the period from May 6 to July 31 has been set at 25,000 tons, which will make an aggregate total of 100,000 tons for the entire year. Although this total has now been reached, most of the rubber which has come in has been what is known as free rubber, which is to say that it was shipped prior to May 8, when the restrictions on imports became effective. Following are the statistics compiled by the Rubber Association of America:

Month	1917, tons	1918, tons
January .....	12,788	16,084
February .....	10,162	13,108
March .....	18,624	17,161
April .....	13,000	12,703
May .....	18,411	16,288
June .....	15,096	24,124
Total.....	88,081	99,468

## Rules for Recruiting Unskilled Labor

Only Those Employing Over 100 Need Go to Government Employment Bureau

WASHINGTON, July 8—Amending the original labor program, the Department of Labor states that for the present only manufacturers engaged on war contracts and employing over 100 workers will be required to recruit unskilled labor through the United States Employment Service after Aug. 1. Non-war industries will be affected only indirectly in so far as they must not offer superior inducements, prevent the transfer of workers urgently needed for war production or in any way attempt to compete with the Government for labor.

The following five classes of labor need not for the present be recruited through the U. S. Employment Service, although of course the machinery of the Employment Service is available to all employers seeking these classes:

- 1.—Labor which is not directly or indirectly solicited.
- 2.—Labor for railroads, except in so far as the Director-General of Railroads has or may recruit, that recruiting shall be exclusively through the United States Employment Service.
- 3.—Farm labor, which will be recruited through the Department of Agriculture.
- 4.—Labor for non-war work.
- 5.—Labor for establishments in which the maximum force including the additional number recruited does not exceed 100 employees.

WASHINGTON, June 28—The number of workers in automobile factories decreased 10.5 per cent in the past year, according to a report by the Department of Labor. In March, 1917, 27 automobile manufacturing plants reported 83,678 workers, and in March, 1918, 74,889. Forty-nine factories reported 118,255 workers in February, 1918, and 122,998 workers in March, 1918, an increase of 4 per cent, while in the same time the salaries for February, \$2,642,126, were 11 per cent less than those in March,

\$2,933,676, showing a startling increase in wages as compared with the increase in the number of workers.

Below is a table making comparison of employment in identical establishments in February, 1918, and March, 1918, showing increase and decrease of employment and wages.

### Reclassify Automobile Mechanics

BOSTON, July 8—The draft boards in Boston have set about reclassifying workers in the automobile industry, and during the past week a number of employees were ordered to come in and report what their work amounted to. Those who were doing nothing but the ordinary cleaning of cars or trucks, or porter work, were told that it did not grant them any exemption, and so some of them have been changed from the deferred class into Class 1A. Others who were working as mechanics were questioned as to whether they were employed upon trucks or passenger cars, and it is thought that the boards will rule that if they are repairmen on the passenger cars they will be certified into the "work or fight" class. Salesmen were not all called in, for about all those left now in the industry are above the draft age.

### Local Labor Boards

WASHINGTON, July 8—Community labor boards to supervise recruiting and distribution of labor will be established in each industrial region of the country by the United States Employment Service. They will apply the federal labor policies as the local draft boards put into operation the selective construction act. Employees and employers will select representatives for these boards to insure adequate representation. There will be one representative of employers, one representative of employees, and three representatives of the United States Employment Service. The members of the boards will be appointed by the State directors of the U. S. Public Service Reserve assisted by Chambers of Commerce and manufacturers' associations, who will nominate industrial management representatives, and State and city federations of labor, which will nominate the labor members.

## War Industry Short 300,000 Workers

U. S. Employment Service Seeking Relief—Coal Miners Needed

WASHINGTON, July 8—War industries of the United States are to-day short between 300,000 and 400,000 unskilled workers. The shortage of workers in the coal mining industries is said by the Department of Labor to be imperiling all other war production.

The situation is considered so serious that the United States Employment Service, which assumes control of unskilled labor on Aug. 1, is endeavoring to complete its machinery so that relief may be given even before that date.

Skilled labor is also facing a serious shortage. One of the largest munitions plants, turning out heavy-caliber guns, is short 2000 machinists. The war plants of Connecticut and Maryland alone face a shortage of 35,000 skilled machinists. The solution, according to the Department of Labor, lies in the recruiting by the United States Employment Service of workers for war work from the non-war industries as quickly as possible.

This work, as was told previously, is to be undertaken at the earliest possible moment by the United States Employment Service, which is increasing its offices to number 700 throughout the country, and is adding greatly to corps of local agents and traveling examiners.

### Many Jobs for Women Workers

WASHINGTON, July 5—Women are packing parts, stuffing bags with excelsior, working on wire parts, cutting copper pieces, binding wires with tape, and soldering joints of wire, applying "dope" and painting the United States Emblem on the bodies of the airplanes in airplane factories, according to a report made by the Women's Committee, Council of National Defense. They are also doing light carpentering and metal work, and sew linen on the wings.

### Mammoth Hotel Garage for New York

NEW YORK, July 8—Hotel men representing a number of the largest hostleries in the city, such, for example, as the Waldorf-Astoria, McAlpin, Claridge, Plaza, Ritz-Carlton, etc., are interested in the erection of a mammoth garage to care for the cars of hotel guests. A company has been incorporated under the style Inter-State Garages, Inc., and it is planned eventually to have a garage in all of the principal cities in the country. The company has obtained a city block bounded by 47th and 48th streets on Second avenue, with a frontage of 250 ft., and extending 350 ft. on the side streets. It is planned to provide an individual locked space for each car, the total capacity to be 863 cars. There will be no elevators, ramps being used to reach the five floors of the building.

Comparative Figures of Employees in Identical Trades in February and March, 1918

Industry	Establishments Reporting for February and March	Period of Payroll	Number on Payroll in—		Per Cent of Increase (+) or Decrease (—)	Amount of Payroll in—		Per Cent of Increase (+) or Decrease (—)
			February, 1918	March, 1918		February, 1918	March, 1918	
Boots and shoes.....	71	1 week	60,767	60,980	+0.4	\$933,308	\$1,016,947	+ 9.0

## South Africa Is Poor Tractor Field

**Gasoline \$1 a Gallon—Machinery Won't Displace Oxen For Some Time**

CAPE TOWN, SOUTH AFRICA, May 10.—Any attempt to sell gasoline farm tractors in South Africa to-day will meet with heavy resistance because the price of gasoline is \$1 per gallon, which makes it prohibitive for farm cultivation. Kerosene is selling at half this price, but if the wear and tear on an engine burning kerosene is greater than that using gasoline, and the same efficiency is not obtained from kerosene, it is a problem to see how it will be economical to use kerosene.

That a tractor is pretty expensive to operate here in addition to the fuel cost is evident because of the great use of oxen for agricultural purposes. The farms are so large in area that it costs very little to feed the oxen, so that farm cultivation with them is cheap no matter how much they are used. Many farmers consider oxen a good investment, even if they are only worked a few days of the year and the remainder of the time are kept grazing.

While the South African farmer will continue to use oxen for many years to come there is certain to be an opening for a suitable farm tractor at the conclusion of hostilities in Europe. There are several South African distributors who are giving personal investigation to the tractor situation, and while they do not expect actively to take up sales for some time they feel certain that the day of the tractor in South Africa is sure to follow the closing of the war. Large farmers are certain to take on a few for experimental purposes, and these will form the beginning of the tractor business.

### Fordson Reports Misleading

LONDON, ENGLAND, June 20.—The circulation of derogatory reports with regard to the performance of Fordson tractors is heard from time to time, and it is unfortunate that these continue to receive attention in many places.

Persons circulating such reports must be ignorant of the exhaustive tests to which these tractors were submitted before the British government permitted itself to purchase 6000 of them. They must also be ignorant of the success this tractor achieved in the competitions arranged by the Food Production Department. They apparently are not aware that these tractors worked 24 hours a day in actual plowing before the government decided to purchase them.

The best answer to the suggestion that the Fordson is not successful when using kerosene for fuel is the fact that these tests were accomplished on kerosene, and the British government after exhaustive trials has continued to use kerosene as the fuel in all of the Fordson tractors.

Six acres were plowed in 44½ hours with a consumption of 1.84 gal. of kerosene per acre. This was made under official observation. The gallon referred to is the British Imperial gallon, which is one-fifth larger than the American gallon.

### England Unifying Transportation

LONDON, ENGLAND, June 4.—England is wrestling with the problem of unifying as well as effecting national control of all forms of transportation. At a recent meeting of the Transport Workers' Federation it was proposed that a National Board of Communications be formed, the constitution of which would be equal representation of employees and the state. This board will take over and administer all inland passenger, mail and merchandise transportation. It would embrace transportation by highway, railroad, water and air.

### World-Wide American Trade Organization

LONDON, July 6.—A world-wide organization of bodies interested in American foreign trade may result from steps recently taken by the American Chamber of Commerce in London. On the ground that nothing short of intelligent co-operation can prevent waste of effort in the end, this chamber has invited about twenty of the leading American foreign trade organizations both in the United States and abroad to work out a practical plan for close co-operation.

### Permits for Use of Roads

LONDON, ENGLAND, June 19.—After Sept. 1 no person in England will be permitted to use a vehicle for the transportation of merchandise on the highways except in accordance with the terms of a permit granted by the Road Transport Board. This is one of the first tangible steps in the complete co-ordination of the vehicles on the highway system.

The official order known as Road Transport Order 1918, issued June 4, specifies that all persons owning or having under their control any vehicle used for the transportation of merchandise by highway shall, before July 31, make a return on the prescribed blank, giving details of the vehicles, their load capacities, and the work for which they are normally used. The only exception to this order is agricultural vehicles and horse-drawn vehicles having a load capacity of less than 1680 lb.

### To Secure Widespread Interest in Export Trade

LONDON, July 6.—To secure a greater personal interest among prominent American business men in every city for American export trade, the American Chamber of Commerce in London is asking secretaries of Chambers of Commerce throughout the United States to give it the names of members interested either in export trade or in our general relations with Great Britain.

## Lack of Ships Hurts South America

**Merchants Can't Move Goods Out and Cars Can't Come In—Expect Improvement**

BUENOS AIRES, ARGENTINA, May 20.—Shipping conditions are the greatest problem that the Argentine distributors have to cope with to-day. There is the difficulty of the Argentine merchant getting ships to move his products, and added to this the export tax that the government levies on all goods exported. Notwithstanding this situation, the good crops of the past season have done much to overbalance the bad conditions following the railroad strikes which began last November. Business conditions are not what they should be, which is partly due to the export situation, and also to the restricted imports. Many stocks of goods are being rapidly absorbed, and prices are increasing every day.

The automobile distributors in Argentina are coping as well as they can with these generally unfavorable conditions, and are looking forward to increased shipments of automobiles, trucks and accessories from America. It is hoped that good shipments will be forthcoming in October so that the coming summer selling season will be favorable.

The numerous strikes have not been without their favorable side, and during the past 10 months, which has been the period of strikes, the automobile distributor has had the opportunity of demonstrating to the Argentine public that the automobile is a practical and essential vehicle. Some of the more enterprising distributors sent cars all over the country and were able to get a great deal of propaganda out of this. Studebaker was one of the leaders in this movement.

Gasoline is now selling at 90 cents a gallon, which, taken in conjunction with the high price of tires, has materially increased the cost of operating a car. The scarcity of gasoline has had a depressing effect, but there are assurances that the United States will supply all that is necessary. Lower powered cars and those economical in fuel are bound to have greater selling opportunities than those which are heavy consumers of gasoline and are heavy users of tires. Shipments of gasoline reaching Argentina before October, or even during November and December, will have a very beneficial effect on the sale of automobiles during the coming spring and summer.

### Hardcastle and Rochette Partners

BUENOS AIRES, ARGENTINA, June 1.—P. A. Hardcastle, Overland distributor for Argentina, has formed a partnership with E. Rochette, who was formerly in charge of the Overland business for all South America. For over 2 years Rochette has been making his headquarters in Buenos Aires. Hardcastle will continue actively in the business.

## 15 Tractor Makers on Exhibition List

### Implement Manufacturers Also Reserve Space for Salina Farming Demonstration

NEW YORK, July 5—Fifteen manufacturers of farm tractors and four makers of plows and other implements have reserved space for the National Tractor Farming Demonstration which is to be held at Salina, Kan., July 29 to Aug. 2. It is expected that the list will be lengthened from week to week, and that the accessory exhibition will be even more comprehensive than has been the case in the past. Following is the complete list of exhibitors to date:

#### Tractors

Avery Co. ....	Peoria
Square Turn Tractor Co. ....	Chicago
Hart Parr Co. ....	Charles City
Holt Mfg. Co. ....	Peoria
Nilson Tractor Co. ....	Minneapolis
Moline Plow Co. ....	Moline
Dauch Mfg. Co. ....	Sandusky
Parrett Tractor Co. ....	Chicago
Russell Co. ....	Massillon
Gile Tractor & Engine Co. ....	Ludington
Advance Rumely Thresher Co. ....	La Porte
Aultman & Taylor Machine Co. ....	Mansfield
Rock Island Plow Co. ....	Rock Island
Gray Tractor Co. ....	Minneapolis
La Crosse Tractor Co. ....	La Crosse

#### Implements

P. & O. Plow Co. ....	Canton
Oliver Chilled Plow Works. ....	So. Bend
John Deere Plow Co. ....	Moline
Grand DeTour Plow Co. ....	Dixon

Following are the complete rules and regulations for the National Tractor Farming Demonstration:

1. Public demonstrations shall begin at 1 o'clock and end at 3, unless other hours are announced by local committee at least 24 hours before starting time. Private demonstrations may be held in the forenoon from 8 o'clock to 11.30.

2. No exhibitor shall be allowed more than one tractor of each size and type on the field during the public demonstrations doing the same kind of work. He may have one or more machines performing different operations, namely, one plowing, one disking, one seeding, etc.

3. Size of land for each tractor exhibitor for plowing demonstrations will be determined by the average number of plow bottoms pulled, the width of plows and speed of machine as given in company's catalog. Each tractor exhibitor must plow out dead furrow to its left.

4. All plows on any given gang must be set at the same depth and kept there during the day's demonstration. This depth will be announced daily by the general manager. (Plows found operating otherwise will be ordered from the field for the balance of the day's work.)

5. All exhibitors will be allotted land in the same field or adjoining fields during each day's demonstration. Land for private demonstrations will be provided daily, in one field or adjoining fields.

6. In all public demonstrations the motor or tractor must not be run at more than 10 per cent above its catalog plowing speed. Tractors may be run on high gear with normal engine speed when disking, harrowing, seeding, etc.

7. Positions on field first day will be arranged by lot, in following manner: Drawing to take place at 10 A. M. Monday, the opening day of demonstration, by serial numbers representing total number of exhibitors.

Position on field for the first public demonstration will be according to numbers, starting 1, 2, 3, 4, etc.

The total number of exhibitors will be

divided into same number of divisions A, B, etc. "A" will occupy preferred position on first day public demonstration, and "B" preferred position on second day, etc.

Exhibitors who do not have representatives at drawing, the drawing will be done for him under the direction of the general manager.

Each exhibitor will be required to finish his land daily in a workmanlike manner, and assist in plowing the end lands as directed by the general manager.

8. Each field plowed will be surveyed and staked ready for afternoon demonstrations. These fields will be tested for the drawbar pull of a 14-inch plow, plowing at the specified depth previous to the demonstration. All manufacturers will be furnished information relative to drawbar pull so they can better determine the number of plows to use on each gang.

9. Each tractor shall bear a placard, to be furnished by the chief observer, showing the brake horsepower of the engine, the revolutions per minute, the plowing speed in miles per hour, and the kind of fuel used and its Baume test. Tractors using more than five per cent of gasoline shall be classed as burning gasoline and be so placarded.

10. All tractors on the demonstration field belonging to one exhibitor must be kept on or along the land allotted him for that day's demonstration, until the hour designated by management for returning to headquarters.

11. No machine will be allowed to operate with special equipment other than that designed for practical use with same. No spectacular methods will be permitted on the part of salesmen or others to attract crowds. The demonstration must speak for itself.

12. Each tractor exhibitor will have the privilege of burning any kind of fuel he desires, but no one will be permitted to burn fuel of higher gravity test than that used by his competitor burning the same kind of fuel. All exhibitors will be required to obtain fuel from one source, such to be designated by general manager.

13. No time will be required of exhibitors to make movie pictures or group photographs for commercial purposes. Manufacturers can arrange to get photographs during the demonstration if they desire. Any manufacturer or representative of farm or trade papers, or news agency will be allowed to have their official photographer on the grounds to get pictures for their own use.

14. Manufacturers will be privileged to make brake horsepower, drawbar pull, and such other efficiency tests as they desire. All such tests desired should be reported to the general manager not later than July 15, so that a sufficient number of Prony brakes, dynamometers and other apparatus can be provided. These early announcements will also be necessary in order that a suitable number of competent judges and sufficient acreage can be provided for all who desire to make tests.

15. The results of all tests made at the demonstration shall be furnished to the exhibitors only and such exhibitors may publish the results as official from the management of the demonstration. No official report of any tests made will be kept by the general manager, judges or the association except by permission of the exhibitor making the tests.

16. Manufacturers will be privileged to exhibit not more than two belt-driven machines in connection with their exhibition.

17. Arrangements will be made for daily demonstrations showing use of tractors harrowing, disking, seeding, and other farm operations, demonstrating general utility of the tractor. The rules governing these demonstrations will be the same as those applied to plowing.

18. The interpretation and enforcing of these rules shall be left to the local manager of each demonstration and the general manager of the demonstrations.

19. Each company exhibiting at these demonstrations shall appoint one manager, who will be expected to report to the general manager not later than 8 o'clock each morning for instructions and information regarding the day's work. This manager of exhibits will be held accountable for the work of his company and no instructions will be issued to any one else, nor will requests, instructions, or complaints be recognized from any one but this exhibit manager. He shall wear a badge furnished him, specifying his being official exhibit manager.

20. Each exhibitor will be expected to keep plows, tractors, etc., around his tent arranged in first class order, and the land allotted him for exhibiting purposes free from circulars, rubbish, etc., such as will be distributed around headquarters daily. They will also be expected to use care at all times in operating machinery with respect to its safety for all visitors. The management will appreciate co-operation of these exhibit managers in all matters.

21. Each entrant will sign the rules and thereby agree to live up to the rules and co-

## Store Door Delivery for New York

### James S. Harlan of Interstate Commerce Commission Outlines Plan for Shipments

NEW YORK CITY, July 8—The greatest step yet taken to eliminate the serious l. c. l. railway freight terminal congestion in New York City was made here to-day by James S. Harlan, Interstate Commerce Commissioner, who outlined a plan for the delivery of all l. c. l. freight direct from the terminals to the consignees without the formality of any notices of arrival. At first the plan contemplated handling only the incoming shipments and these will be delivered to the consignees on their dates of arrival and stored in public warehouses if the consignees refuse to accept them and pay the freight and delivery charges when they are delivered at their doors.

The entire mercantile district of the city will be divided off into zones and all the trucks delivering the freight will leave from the various terminals with full loads to be delivered in one of the zones. Each truck used in the work will be registered and will be under the supervision of a city drayage director who will have general supervision and control for the consignee of the trucking of freight from pier or freight station after it has been placed on the pier or freight station floor by the carrier.

Only registered trucks will be used to deliver the goods and full loads will be carried by each truck when it leaves the freight station or pier.

The system as proposed may be put into effect in this city by Aug. 15, 1918, and will prevent consignees from utilizing railroad cars, piers and freight stations as warehouses by taking advantage of the 48-hr. demurrage-free period heretofore in effect.

Although for the present, the system is to be only applied to incoming shipments, Commissioner Harlan believes that in the natural course of events, the many benefits will result in its being extended to include a pick-up service for outgoing goods. The whole system is to be largely self-governed and there probably will be a carriers' committee, a shippers' committee and a draymen's committee for the purpose.

operate with the committee in every way to make the tractor demonstration a success.

22. The field manager shall have authority to order from the field any machine whose operator does not comply with the rules, and, further, any exhibitor who is manifestly disregarding the rules will not have land laid out or furnished for him on the succeeding days, or until such time as he has met the conditions.

23. No exhibitor joining the national demonstration will be permitted to exhibit until he has given correctly the price that he is in position to furnish tractors at regular production, the correct weight of tractors, and all data pertaining to their construction and rating, minimum and maximum speed at which the motors are to run, and the committee has the right to have any such machines placed under test to prove the correctness of the data that are furnished.

# Gasoline Production Increases

Record Output in April—Ten Months Figures for Production and Stock on Hand

WASHINGTON, July 8—The production of gasoline in April of this year was the largest that the country has ever known. It was more than 23,000,000 gal. greater than the production in March and more than 80,000,000 greater than the output of April, 1917. The daily average production for April, 1918, was 9,779,872 gal.

According to figures just issued by the Bureau of Mines, the stock of gasoline on hand at the refineries on April 30, 1918, was 509,197,134 gal., or 17,185,252 gal. less than was on hand one month previous, but it was 163,997,939 gal. greater than the stock on hand on July 30, 1917.

Crude oil production in April showed a very slight drop which, in view of the fluctuations in the production curve, is almost negligible. The decrease amounted to only 38,108 bbl. when compared with the output for March. The 26,201,554 bbl. of crude produced in April constitutes an output greater by about 4,000,000 bbl. than that of February. The stock of crude on hand April 30 was greater than that on hand at any other recent time except March 31, 1918.

The curves accompanying show how the production and stocks on hand of crude oil and gasoline have varied since July, 1917. The following table gives the amount of crude and distillates on hand at refineries on April 30 and March 31:

1918	Total April 30, 1918	Total March 31, 1918
Crude run (bbl.)	12,600,062	26,239,662
Oil purchased to be re-run (bbl.)	954,205	3,696,372
Gasoline (gal.)	509,197,134	269,627,968
Kerosene (gal.)	393,527,476	151,228,007
Gas and Fuel (gal.)	471,644,479	587,985,804
Lube (gal.)	144,383,212	69,308,351
Wax (lb.)	151,228,317	43,957,019
Coke (ton)	13,109	44,248
Asphalt (ton)	101,328	56,901
Misc (gal.)	248,260,551	94,865,148

## Plenty of Gasoline If Not Wasted

WASHINGTON, July 9—There is no shortage of gasoline. The gasoline supplies are ample to take care of our war and normal requirements if we will practise sane conservation in this country.

These statements were made to-day by W. Champlin Robinson, Director of Oil Conservation, United States Fuel Administration. The demand for gasoline for airplanes and trucks with the American Expeditionary Forces is constantly growing, and will necessitate continually increasing shipments overseas.

The present stocks are now ample to supply the war needs and allow the normal rational consumption to continue.

Production and stocks on hand of crude oil and gasoline for the past ten months

But waste of gasoline must cease, stated Mr. Robinson, in order that we may be able to continue normal rational consumption in this country and amply meet our war requirements.

There is no suggestion of enforced curtailment of gasoline or lubricating oils in the minds of the Fuel Administration.

There is no suggestion of limiting the use of passenger cars, despite newspaper reports to the contrary.

There is a decided opposition by the Fuel Administration, however, to the careless wasteful handling of gasoline as exists at present in this country, and the Fuel Administration warns that unless the waste is eliminated possible restrictions may have to be inaugurated to insure sufficient gasoline and oil for our war needs.

The Fuel Administration will soon issue a poster to every garage and distributor of oil and gasoline, pointing out

five important methods of preventing waste, as follows:

- 1—That the use of gasoline for cleaning parts be abolished.
- 2—That all leaks in gasoline lines on passenger cars, gasoline tanks, gasoline tank hoses and nozzles, etc., be stopped.
- 3—That careless handling of the gasoline tanks and hoses creating unnecessary waste through spilling be stopped.
- 4—That the tops of gasoline tanks be kept tight.
- 5—That motorists shut off their engines when not driving.

## Plenty of Gasoline if Not Wasted

PLAINFIELD, N. J., July 8—The Wright-Martin Aircraft Corp., Long Island City, has purchased the Plainfield (N. J.) plant of the Bosch Magneto Co. The plant has not been used for some little time. It is not stated for what purpose Wright-Martin will use it.

## Happy Farmer Equipment To Be a One-Man Outfit

LA SALLE, WIS., July 6—A line of farm machinery specially designed for use with the Happy Farmer tractor so that one man can operate the tractor as well as the machinery is being developed. The line will consist of gang plow, disk harrow and power-lift seed drill. The control levers on these pieces of machinery will be such that they can be operated by the tractor driver, thus making the machinery a one-man outfit. The LaCrosse Tractor Co. is working on a production schedule of 4000 tractors this year.

### Overland Factory Being Enlarged

TOLEDO, July 5—The Willys-Overland Co. is building additions costing \$307,430 to its Toledo plant. The largest addition is to be a 300-ft., one-story structure, costing \$225,000, to be fitted as a machine shop for making 8-in. shells, under a new contract recently awarded the company. Other additions are a boiler room, costing \$65,430, and an extension to one of the factory offices at a cost of \$15,000. All have been necessitated by the large demands upon the company by the government.

### Perfex Radiator to Expand

RACINE, WIS., July 8—The Perfex Radiator Co., Racine, Wis., expects to begin work Aug. 1 on its new plant, to be 125 x 300, three stories, and cost more than \$100,000.

### New Shop for Federal

MILWAUKEE, July 8—The Federal Pressed Steel Co., which is devoting much capacity to the manufacture of shells for anti-aircraft guns and other munitions, will build a new machine shop, 100 x 252, at its works on Keefe Avenue, at North Pierce Street, Milwaukee. The project will involve a total expenditure of more than \$125,000 in buildings and equipment.

### Geuder, Paeschke & Frey Adds

MILWAUKEE, July 8—The Geuder, Paeschke & Frey Co. has broken ground for a new galvanizing and pickling shop, 50 x 45, at its main works at Fourteenth Street and St. Paul Avenue. The unit will cost about \$15,000 completely equipped.

### Coast Branch for Hyatt

NEW YORK, July 8—The Hyatt Roller Bearing Co. of Chicago has opened a branch office in San Francisco, from which Pacific Coast trade will be handled. A. W. Fisher will be in charge of the branch.

### Gerlinger to Double Capacity

MILWAUKEE, July 8—The Gerlinger Steel Casting Co. has started work on the construction of additions which will increase the capacity more than 100 per cent. The company has been operating electric steel foundry exclusively for

## Current News of Factories

*Notes of New Plants—Old  
Ones Enlarged*

several years, but has been engaged in the steel foundry business for many years. The main addition will be 80 x 171 x 200, and will be equipped with a new 5-ton Moore electric furnace. The present equipment consists of one ¾-ton and one 1½-ton Snyder electric furnaces.

### Austin Developing Farm Tractor

CHICAGO, July 6—The F. C. Austin Corp. has for some time been developing a farm tractor which it expects to start production on this fall, and to build in quantities. This company has for years been a large manufacturer of road machinery, the manufacture of which is continuing, but a new factory is being built for tractor production. Technical details are not available, but it is expected the tractor will sell somewhere between \$1,600 and \$2,000.

### O'Neil Paint Expands

MILWAUKEE, July 8—The O'Neil Oil & Paint Co., 297 East Water Street, Milwaukee, a large refiner and wholesaler of motor oils, gasoline, etc., has increased its capital stock from \$350,000 to \$500,000 to accommodate the growth of its business. At the annual meeting several employees were elected vice-presidents in appreciation of faithful service. Harry C. Topp, assistant treasurer and credit manager, was elected treasurer to succeed William E. Krause, who resigned July 1. The official personnel now is: President, George F. O'Neil; vice-presidents, L. D. O'Neil, James S. Motter, Frederick C. Fowler and Roy H. O'Neil; secretary, H. W. Houghton; treasurer, Harry C. Topp; assistant treasurer, P. M. Lauf.

### Stroh Castings Enlarges Plant

DETROIT, July 6—The Stroh Castings Co. announces the conclusion of plans to add a second plant. The old Denby Motor Truck Co. factory at 22 Dubois Street has been taken over. This has 25,000 sq. ft. of floor space, and will be devoted exclusively to cleaning, grinding, inspection and shipping. The space formerly occupied by these departments will be used for moulding, and the plant will have a capacity of 100 tons of castings daily, 90 per cent of which will be taken by the Government.

### Wilcox Making Army Tents

TOLEDO, July 5—The M. I. Wilcox Co., manufacturer of radiator covers, is working on a government order for tents at the new plant, No. 3, which is a three-story building with basement, and contains 20,000 sq. ft. of floor space.

## United States Carburetor Breaks Ground for Plant

OMAHA, July 6—Ground has been broken for the first unit of the factory buildings to be occupied by the United States Carburetor Co. The company, which is capitalized at \$500,000, is manufacturing a kerosene carburetor, 15,000 of which already have been contracted for, and the output of the factory, about 500 a day, has been sold for some time ahead. The factory will be located on the belt line facing Florence Boulevard. The first structure will be 125 x 125, and will house 200 men. The officers of the company are: President, Henry R. Gering; vice-president, A. C. Marshall; secretary, T. R. Murphy; treasurer, Henry T. Goos.

### Automotive Sales Co. Incorporates

DETROIT, July 6—The Automotive Sales Co. has been incorporated and will conduct an automotive manufacturers' sales agency, with offices at 554 Book Building. W. L. Mack, formerly sales manager of the Shakespeare Co., Kalamazoo, Mich., is president. A. H. Doolittle, for the last 3 years sales manager for the Zenith Carburetor Co., Detroit, is treasurer and manager. The company will sell entire factory outputs and handle all factory sales of the Shakespeare company, Copeman Lubricating System and Connecticut Electric Clock, as well as several other automotive specialties.

### Lapeer Tractor-Truck Plant Complete

LAPEER, MICH., July 6—The new plant of the Lapeer Tractor-Truck Co. was completed last week. It is a two-story structure, 60 by 200 ft. Machinery is being delivered and the plant is expected to be completely equipped within the next 2 weeks. The capital stock of the company is \$100,000, practically all of which has been subscribed for by Lapeer people. The officers of the company are: President, W. H. Tucker; vice-president, C. W. Smith; secretary, E. E. Mix; treasurer, R. T. Carpenter.

### Schweppe & Wilt Enter Machine Tool Field

DETROIT, July 8—The Schweppe & Wilt Mfg. Co. has entered the machine tool field, and has taken over the business and part of the equipment of the Wilt Engineering Co. This latter concern was an engineering and developing company which brought out several new types of machine tools, which the Schweppe company will now manufacture, in addition to its standard automobile parts. The company has greatly increased its floor space.

GRAND RAPIDS, July 8—The Rapid-Change Wheel Co. has been incorporated with a capitalization of \$50,000. The company will make a supplemental hub. The officers are: President, John S. Noel; vice-president, J. Seman; secretary, Louis Dolan; treasurer, H. Hagen.

## Couzens to Run for Mayor— Resigns as Head of Police

DETROIT, July 5—James Couzens, former vice-president and general manager of the Ford Motor Co., and for the past 2 years commissioner of police, has resigned the latter office to become a candidate for mayor.

George Woelfel, Jr., secretary to Commissioner William M. Webster, of the National Association of Automobile Accessory Jobbers, has resigned and will leave the work of the jobbers' association July 13.

N. W. Meyer, former sales promotion manager of the King Auto Sales Co., Detroit, has been appointed sales manager of the Detroit branch of the Roedding Signal Tail Light, Grand Rapids.

O. M. Brede, assistant secretary of the Detroit Section, Society of Automotive Engineers, has enlisted in the aviation section of the United States Army and has left for the aviation repair depot at Lovefield, Dallas, Texas. Mrs. Brede will fill the vacancy during the period of his enlistment.

T. L. Loose, formerly with the Hendee Mfg. Co., Springfield, Mass., is now manager of the Canton spring and axle plants of the Standard Parts Co., succeeding J. B. Childe, who will go to the general offices of the company in Cleveland.

W. L. Woodward, assistant manager of the rim and tube plant of the Standard Parts Co., became the manager of that factory July 1, succeeding J. C. Manterach, whose resignation was effective that date.

B. R. Winborn, until recently sales manager of the Perfection heater division of the Standard Parts Co., has been appointed general manager of that division.

Curtiss Wadleigh has been appointed manager of the New England branch of the Republic Tire Co., succeeding W. S. Carleton, who has entered the government service.

Roy S. Fraser has been placed in charge of the New England branch of the Pennsylvania Tire & Rubber Co., taking the place of Wallace O. Durrell, who has joined the United States Army.

Frank B. Crockett has resigned from the C. P. Rockwell Co., Boston, Mass., to take charge of the New England territory for the H. J. Koehler Co.

Prescott C. Ritchie has been appointed district representative of the Westinghouse Electric Mfg. Co., with headquarters in Indianapolis. He succeeds H. S. Johnson, who has resigned.

J. B. Clarkson, managing director of Hope Gibbons Sons & J. B. Clarkson,

## Men of the Industry

*Changes in Personnel and  
Position*

Wellington, New Zealand, dealer in automobile accessories, who is now in England, expects to sail from there in time to arrive in New York about July 10.

### Palmer to Manage Permalife

NEW YORK, July 8—C. B. Palmer has been elected general manager of the Permalife Storage Battery Co., Poughkeepsie, N. Y., and will have full charge of the business during the absence of President W. H. Lyall, who is in class 1A of the draft and expects soon to enter government service. Mr. Palmer was formerly secretary, treasurer and general manager of the Duchess Mfg. Co., Poughkeepsie, and for the past 2 years has been president of the board of directors.

Major B. H. Gitchel has been appointed chairman of the industrial relations section of the Aircraft Production Board, succeeding C. P. Neill. Major Gitchel is at present assistant in the office of the Secretary of War. Mr. Neill becomes chairman of the Railway Board of Adjustment No. 2.

G. Stanley Porter, who was connected with the Jackson Rim Co., Jackson, Mich., for the past 5 years, will have charge of the fabricated steel wheel department of the Hayes Wheel Co. of the same city.

L. K. Cooper has been appointed sales manager of the Chevrolet Motor Co. of St. Louis with headquarters at the St. Louis plant. He has been assistant to the sales manager of the Chevrolet Motor Co. of New York.

Charles Schenck, who has been with the Budd Wheel Corp., Philadelphia, for the past 2 years, has resigned as manager. His future plans have not been announced.

T. C. Woodin has been appointed sales manager of the Champion Spark Plug Co., Windsor, Ont.

F. W. Henderson has been elected president of the Signal Motor Truck Co., Detroit, to succeed A. C. Burch, resigned, to become vice-president of sales and a director of the Clyde Cars Corp., Clyde, Ohio.

C. C. Winningham has resigned as advertising manager of the Hudson Motor Car Co., Detroit, but retains his stock interests. He has not announced his future plans. It is said that no successor will be appointed during the war.

## R. H. Johnston Elected Vice-President of White

NEW YORK, July 8—R. H. Johnston, who has been manager of the New York branch of the White company since 1910, and has been actively connected with the company for the past 15 years, has been elected a vice-president. He will immediately transfer his headquarters to Washington, and is to be succeeded as New York manager by William H. Moore of Pittsburgh.

### Deliver 5000 Class B Trucks

WASHINGTON, July 6—Slightly more than 5000 class B standard army trucks have been produced and delivered to the Government to date. Production of the B truck, which is 3-ton capacity, is between 75 and 100 per day. Production has been slightly hampered by some delays in parts manufacture.

### Open Bids for Kitchen Trailers

WASHINGTON, July 8—Bids will be opened this week from automobile manufacturers for the 15,000 1½-ton kitchen trailers which will shortly be purchased. These trailers will be for delivery in September or October. Bids were requested in quantities of 500, 1000 and 2000, insuring wide distribution of the orders.

### Refinery Plans Four Buildings

CLEVELAND, July 5—The newly organized Cleveland Smelting & Refining Co. has broken ground for the first of a cluster of units, which will be a storage building, 60 by 140 ft., to cost in the neighborhood of \$20,000. Three other buildings, each 60 by 120 ft., will be erected later. These will be a refining room, blast furnace and copper room.

### New Incorporations

MILWAUKEE—Badger State Sales Co.; capital stock, \$25,000; to deal in new and used motor vehicles; incorporators, Herbert F. Krueger, Milo E. Winkie and others.

MILWAUKEE—O'Neil Oil & Paint Co.; amendment to increase capital stock from \$350,000 to \$500,000.

MILWAUKEE—Crude Oil Gas Burner Co.; amendment to change corporate style to Crude Oil Gas Systems Co. J. L. Marshall, president; J. C. Pinney, Jr., secretary.

RACINE—Racine Mutual Automobile Insurance Co.; no capital stock; to underwrite motor vehicle coverage on mutual plan.

CHICAGO—The Perfection Truck Tire Co.; capital stock, \$25,000; incorporators: F. H. Drury, W. A. Hamilton and W. L. Pollard.

### Dividends Declared

The Chevrolet Motor Co. declared its regular quarterly dividend of 3 per cent, payable Aug. 1 to stockholders of record July 15.

# Scientific Tests for Headlamps

## New York Develops Laboratory Method and Will Certify Anti-Glare Devices

NEW YORK CITY, July 10—A sane effort has been made by Secretary of State Francis H. Hugo of New York, to test headlights for the purpose of determining whether they should be classed as glaring or not. Instead of a state evolving its own scheme, Secretary Hugo has for some months been working with a special committee of the Society of Automotive Engineers and another committee from the Society of Illuminating Engineers. A long line of laboratory experimentation has been carried on, and the result is that glare is to be tested according to the strength of the light at a distance of 100 and 200 ft. in front of the car.

While all of the experimental work was conducted in the laboratory it will be possible with a foot-candle meter to make tests on darkened streets of any city. The entire scope of the law is based on tests with such instruments. This is the first time in which a scientific method of tests has been developed, and one in which the personal equation is almost entirely eliminated.

The New York State law which makes compulsory the elimination of glare provides also for the testing of headlamps by the Secretary of State. The Secretary of State, following a conference between makers of glare eliminating devices and representatives of the S. A. E. and the Society of Illuminating Engineers, has laid down the following specifications to which devices must conform to be acceptable:

- 1—The candlepower must be at least 1200 at a distance of 200 ft. in front of the car and at a point between the roadway and 42 in. above it.
- 2—The candlepower must not exceed 2400 at a distance of 100 ft. in front of the car and at a point 60 in. (or any higher) above the road.
- 3—The candlepower must not exceed 800 at a distance of 100 ft. in front and 7 ft. to the left of the center of the car at a point 60 in. above the road.

According to the provisions of the New York State law, a manufacturer of headlamp glare eliminating devices may submit samples to the Secretary of State for testing. These will be tested according to a standard method and with instruments which are standard and have been developed for this specific purpose. If the devices conform to the specifications previously mentioned a certificate to that effect will be given the manufacturer. If the devices cannot be made to conform to the specifications using the standard bulbs prescribed by the specifications but are O.K. with bulbs of another candlepower, the device may be passed with corresponding limitations.

Any manufacturer of glare eliminating

devices may submit samples of his product to the Secretary of State for testing. The law provides a fee of \$50, payable to the Secretary of State, for the work.

Following is the complete text of "Specifications for Headlight Tests":

### SPECIFICATIONS FOR HEADLIGHT TESTS

#### General Conditions of Acceptability

For the purpose of test the intent of the New York State law dealing with automobile headlights and providing that front lights shall be so arranged, adjusted and operated as to avoid dangerous glare or dazzle, and so that no dangerous or dazzling light, projected to the left of the axis of the vehicle when measured 75 feet or more ahead of the lamps, shall rise above 42 inches on the level surface on which the vehicle stands, such front lights shall be sufficient to reveal any person, vehicle or substantial object on the road straight ahead of such motor vehicle for a distance of at least 200 feet, is deemed to be complied with if the following conditions are fulfilled:

1. Any pair of head lamps under the conditions of use must produce light which, when measured on a level surface on which the vehicle stands at a distance of 200 feet directly in front of the car and at some point between the said level surface and a point 42 inches above this surface, is not less than 1200 apparent candlepower.
2. Any pair of head lamps under the conditions of use shall produce light which, when measured at a distance of 100 feet directly in front of the car, and at a height of 60 inches above the level surface, on which the vehicle stands, does not exceed 2400 apparent candlepower, nor shall this value be exceeded at a greater height than sixty inches.
3. Any pair of head lamps under the conditions of use shall produce a light which, when measured at a distance of 100 feet ahead of the car, and 7 feet or more to the left of the axis of same, and at a height of 60 inches or more above the level surface, on which the vehicle stands, does not exceed 800 apparent candlepower.

#### Conditions of Laboratory Test

In order to determine whether any particular device conforms to these requirements, it shall be subjected to laboratory tests according to the following specifications:

#### Number of Samples

Two pairs of samples of the device submitted shall be subjected to test. In the case of front glasses, the sample shall be of 9 1/4 inch diameter, when practicable.

#### Reflectors and Incandescent Lamps

The reflectors used in connection with the laboratory tests shall be of standard high-grade manufacture of 1.25 inch focal length, with clean and highly polished surfaces and as nearly truly paraboloidal in form as practicable, and as approved for this purpose by the National Bureau of Standards.

The incandescent lamps used in connection with the laboratory test shall be of standard high-grade manufacture and as approved for this purpose by the National Bureau of Standards.

#### Adjustments by Manufacturers' Representative

The manufacturer of the device shall be given due notice of the date and place of test. Manufacturers' representatives present at the test shall be privileged to adjust their devices in any way which represents an ordinary and legitimate adjustment, including tilting the lamps or reflectors, which can be carried out by purchasers of the device, or such adjustment may be made by the laboratory expert acting on the instructions of the manufacturer. The character of the adjustments so made shall be carefully noted and stated in the report as manufacturer's adjustment.

#### Tests

The tests shall be as follows:

- Test 1. Four-point test of pairs of samples. A pair of testing reflectors, mounted similarly to the head lamps on a car, shall be set up in a dark room at a distance of not less than 60 feet nor more than 100 feet from a vertical white screen. If a testing distance of 100 feet is taken, the reflectors shall be set 28 inches apart from center to center, and if a shorter testing distance is taken, the distance between reflectors shall be proportionately reduced. The axis of the lamps shall be parallel and horizontal, or as tilted in accordance with manufacturer's adjust-

ment. The intensity of the combined light shall then be measured with each pair of samples in turn, with the reflectors fitted with a pair of each of the following types of incandescent lamps, in turn.

- (1) Vacuum type, 6-8 volts, 17 mscp., G-12 bulb.
- (2) Gas-filled type, 6-8 volts, 20 mscp., G-12 bulb.

The lamps shall be adjusted to give their rated candlepower. Measurements shall be made at the following points at the surface of the screen:

A In the median vertical plane parallel to the lamp axes, on a level with the lamps.

B In the same plane one degree of arc below the level of the lamps.

C In the same plane one degree of arc above the level of the lamps.

D Four degrees of arc to the left of this plane and one degree of arc above the level.

In an acceptable device both pairs of samples shall conform to the following specifications for observed apparent candlepower.

Points A and B. At least one of these points the apparent candlepower shall not be less than 1200.

Point C. The apparent candlepower shall not exceed 2400.

Point D. The apparent candlepower shall not exceed 800.

Provided, however, that if the test indicates that a device which is unacceptable with either of the test lamps will come within the specifications with lamps of another candlepower or of the other type, the device may be passed with corresponding limitations as to the incandescent lamps to be used in connection with it. Test 2. Complete test of single sample.

A single sample taken as an average representative of the device as manufactured, shall be submitted to a complete test with a vacuum incandescent lamp of 17 candlepower, 6-8 volt rating in a G-12 bulb. This test shall show its light distribution characteristic by actual measurements made according to recognized and exact methods.

#### Distribution of Samples

One pair of the samples submitted shall be retained by the testing laboratory for purpose of future reference and as sample of construction, and the other pair shall be returned to the office of the Secretary of State.

#### Report

The report of the tests shall be rendered in duplicate to the Secretary of State, and shall be signed or initialed not only by the expert making the test, but also by an executive officer of the institution making the test.

It shall include a statement by the testing laboratory as to whether the device when properly applied substantially complied with Section 286 of the Highway Law and shall suggest the maximum candlepower to be used with the same, and as to the other conditions necessary in the operation of the device, in such a way that it will comply with the requirements of this specification.

#### Distribution of Truck Weights

(Continued from page 48)

faster vehicle. Of course, quality of steel used also is a very important factor, but it would be difficult to say whether alloy steel springs are more used in large trucks than in small trucks.

Propeller shaft proportional weights are not affected by load capacity. The average value for this part is 1.45 per cent. Many of the larger trucks have double propeller shafts, and both of these, as well as the universal joints in the transmission line, are included in this figure.

#### First American-Built Handley-Page Bombing Plane Launched

(Continued from page 46)

produced in the whole year of 1915." And on the Liberty engine, the present director of airplane building placed an uncompromising endorsement which has much weight coming from a man of Mr. Ryan's well known conservatism and capacity for getting at facts.

**General Engineer Depot Contracts**

WASHINGTON, June 28—The following awards have been made by the General Engineer Depot, United States Army:

June 19, 1918

Champion Spark Plug Co., Toledo, Ohio; spark plugs.  
Duff Mfg. Co., Pittsburgh, Pa.; automobile jacks.

June 20, 1918

Penberthy Injector Co., Detroit; valves and injectors.

**Medical Contract for Prest-O-Lite**

WASHINGTON, June 26—A contract has been issued by the Surgeon-General of the Army to the Prest-O-Lite Co., Indianapolis, Ind., for laboratory apparatus.

**Ordnance Contracts Awarded**

WASHINGTON, June 28—The Ordnance Department has placed contracts with the following companies:

Nash Motors Co., Kenosha.  
Four Wheel Drive Auto Co., Clintonville, Wis.  
Russel Motor Car Co., Buffalo.  
Willard Storage Battery Co., Cleveland.  
Chicago Pneumatic Tool Co., New York.  
Timken Detroit Axle Co., Detroit.  
Detroit Steel Castings Co., Detroit.  
Commerce Motor Car Co., Detroit.  
Dodge Brothers, Detroit.  
Aluminum Casting Co., New York.  
Packard Motor Car Co., Detroit.  
Pyrene Mfg. Co., New York.  
The White Co., Cleveland.  
Wilson Body Co., Detroit.  
Holt Mfg. Co., Peoria, Ill.  
Motor Trucks (Ltd.), Brantford, Ontario.

**Contracts**

International Harvester Co. of New Jersey, Chicago.

C. I. Best Gas Traction Co., Dayton.  
American Automobile Accessories Co., Cincinnati.

Maxwell Motor Co., Dayton.

WASHINGTON, July 3—The Surgeon-General of the Army has approved the following contracts:

Plymouth Rubber Co., Canton, Mass., rubberized fabric.

Tyer Rubber Co., Andover, Mass., surgical equipment.

U. S. Rubber Co., New York, basins.

WASHINGTON, July 3—The Bureau of Supplies and Accounts of the Navy has placed the following contracts:

Wayne Oil Tank & Pump Co., Fort Wayne, tanks.

Packard Motor Car Co., Detroit, trucks.

Detroit Forgings Co., Detroit, forgings.

Rome Brass & Copper Co., Rome, N. Y., rods, sheets, tubes.

Wayne Oil Tank & Pump Co., Fort Wayne, measuring pumps.

Ford Motor Co., Detroit, twelve Ford cars.

Becker Milling Machine Co., Hyde Park, Mass., milling machinery.

WASHINGTON, July 3—The Willys-Overland Co., Toledo, Ohio, has a contract with the Ordnance Department for the manufacture of 2927 75-millimeter guns and carriages, according to a letter from Major-General Crozier, Chief of Ordnance, to Senator J. W. Weeks, published in the Congressional Record.

WASHINGTON, July 3—The General Engineer Depot of the War Department has placed the following contracts:

The Acme Rubber Co., Trenton, fire hose.

Arcadia Trailer Corp., Newark, spare parts for trailers.

Goodyear Tire & Rubber Co., Philadelphia, steam hose.

Goodyear Tire & Rubber Co., Dayton, nozzles for fire hose.

Splitdorf Electric Co., Newark, electric parts.

Westinghouse Co., Schenectady, engine parts.

**Navy Contract Awards**

WASHINGTON, July 5—The Bureau of Supplies and Accounts of the Navy Department has placed the following contracts:

Lawrence Bros. Co., South Gardiner, Me., airplane spruce.

Morse & Buffman Co., Providence, airplane spruce.

Van Blerck Motor Co., Washington, gas engines.

WASHINGTON, July 6—The General Engineer Depot, War Department, has placed the following contracts:

Hendee Mfg. Co., Springfield, bicycle and motorcycle tools.

Arcadia Trailer Corp., Newark, N. J., tire-pressure trailers.

Detroit-Trailer Co., Detroit, reversible trailers.

Highway Trailer Co., Edgerton, Wis., reversible trailers.

Thermold Rubber Co., Trenton, hydraulic compressed brake lining.

WASHINGTON, June 29—The General Engineer Depot of the War Department has let contracts as follows:

Acme Road Machinery Co., Frankfort, Ky., portable stone bins.

American Road Machinery Co., Philadelphia, Pa., portable bins.

Goodyear Tire & Rubber Co., Akron, airplane fabric.

August Zimmermann, Washington, speedometers.

**Reo Speedwagons for Canadian Service**

LANSING, MICH., July 6—The Reo Motor Car Co. will deliver under contract to the Canadian Government 185 Reo speedwagons, eighty-five of which will be used for ambulance purposes. For ambulance work the government buys only the chassis, fitting on its own especially made ambulance bodies. The remaining part of the contract will be used for general transportation purposes in hospital work. The speedwagon ambulances will transport wounded men from the transports to hospitals in the interior. The delivery of the Reo speedwagons will make a total of 400 such vehicles in government service in the Dominion.

*For Delivery Cars*

*For Trucks*

*For Tractors and Gas Engines*

## *Increase the Power of Your ENGINE*

A DOSE of Johnson's Carbon Remover—the engine laxative—will increase the power of your car—improve acceleration—stop that knock—quiet your motor—save your batteries—and reduce gas consumption 12% to 25%.

*Economical—Easy—Safe*

Johnson's Carbon Remover is the easiest, cleanest, safest and most satisfactory way of removing carbon deposits. It will save you from \$3.00 to \$5.00 over any other method without laying up your car and with much better results. After one application your car will run as it did the first 500 miles—quietly and full of “pep”—and you will secure the maximum power and speed from the minimum amount of fuel.

## JOHNSON'S CARBON REMOVER

is very easy to use. Five minutes' time and no labor or experience required. You can do it yourself without even soiling your hands.

*Use It Every 1,000 Miles*

If you will use Johnson's Carbon Remover every 1,000 miles or oftener, giving Carbon no chance to accumulate, you will automatically eliminate most valve trouble and your engine will always be clean and sweet and at its highest efficiency.

Write for our booklet on “Keeping Cars Young”—We will gladly send it—free and postpaid.

## Commercial Aviation in Our Foreign Trade

Mail Parcel Post and Light Express Service to Europe and  
South America a Certainty—Quick Conversion of  
Fighting Planes to Planes of Commerce

**A**LTHOUGH no definite program for industrial reconstruction measures following the close of the war has been formulated, industries are already looking forward to that period. This is especially true of the aircraft manufacturer who is preparing for the greatest possible output and who recognizes that with the close of the war the demand for planes will quickly cease unless industrial consuming channels are developed. Already England has announced what might be taken as an indication of her aerial policy. She has planned mail routes by air from London to Australia by way of India, which will bring Bombay, Sydney and Melbourne a matter of days from London as compared with weeks. These will be extended to Canada, Africa and some islands of the ocean.

Reports filtering from Germany indicate that she is awake to aviation possibilities in commerce after the war. It is reported she already has blueprints of huge commercial machines for long-distance flying that will not be limited to mail routes or parcel post service, but that are ideally suited for light express matter.

### Germany a Serious Trade Rival

The value of such a program in controlling foreign trade cannot be over estimated. Germany must be looked upon as a serious trade rival. This is chiefly true in aviation because she has been a leader in standardizing aircraft. The work of America in

standardizing automobiles has proved an object lesson to Germany. Germany seems to have taken our standardization lesson, hook, bait and sinker for her commercial aviation program. She has standardized her war airplane program. This will make her a trade factor of first importance and one that we cannot afford to stand idly by and passively watch.

### Commercial Airplane Service Needed

The necessity of commercial airplane service as related to the United States must not be overlooked. With South America there is urgent need for such a mail service. There is a broad field for such a parcel post service and there is almost a limitless field for such a service as carrying light express and merchandise.

Take the case of Argentina as an example of how an air service can work out. At present the City of Buenos Aires is approximately 22 days by steamboat from New York. There is no reason why these 6000 miles should not be covered in 15 days or perhaps 17 were fast steamboat lines organized. Undoubtedly competition after the war will bring such about. But 2 weeks from New York to Buenos Aires is a slow mail service for the conduct of important business. This means an inside limit of 6 weeks from the time a letter leaves an inland manufacturing city in America until a reply can be received from a merchant in Buenos Aires. There is not sufficient flexibility in this for good business

transactions. Cable rates are almost prohibitive, but while cables are largely used they are resulting in an increase of the retail price of American commodities in Argentina, which is not good business in meeting the products of cheaper European labor. Cable charges of over \$50 have been added to some retail automobile prices in a few cases.

With an airplane mail service covering the 6000 miles between New York and Buenos Aires, it will be possible to cut the present 22 days to at least 5 or 6 days at the outside. This means one-third the time required for mail that is needed at present. The value of this saving of time is almost incalculable to the American merchant as well as to the Argentine merchant.

### Airplane Must Supplement Ships

It will be literally impossible for America to establish its trade supremacy in South America and hold that trade which has been handed to us by the war without meeting our European competitors on the same basis of mail service that Europe will offer. Our increased number of merchant ships will not be sufficient to offset the advantage that an aerial mail service will give to Europe.

The conclusion of the war will without doubt find us with great shipping facilities. Our present ship-building program, together with the curb on the submarine indicates this. We must prepare to use this shipping tonnage to the greatest advantage. The airplane must supplement the cable service and the boat service in this respect.

Crossing the North Atlantic in an airplane has taken the spot-light position of accomplishment which for years was occupied by the North Pole. The person first crossing the North Atlantic in an airplane will compare with Peary, Scott, Amundsen and other great Polar discoverers. Conviction is gaining every week that the flight across the North Atlantic may be an accomplishment before the end of the year. Already rewards of \$60,000 have been offered for the first aviator making such a flight.

### Flight to South America is Simple

The airplane flight to South America should be much safer and much simpler than that across the North Atlantic. The heavy seas and storms of the North Atlantic are entirely lacking in the equatorial Atlantic. For days this part of the ocean is as calm as a mill-pond. This is of great value in trans-ocean flying. Undoubtedly the shore-line route could be followed once

the South American continent is reached, which would be at some point adjacent to the Amazon or further north if necessary. Land routes across South America would be very difficult because of the sparsely populated areas of country and the lack of competent repairmen to care for a machine. On the other hand, the coast-line route should be relatively safe for large hydroplanes or flying boats.

Airplanes designed for war work would be readily convertible into vehicles of commerce. The conversion is much easier than that for land vehicles. It is rather difficult to adapt a land vehicle such as a tractor intended for hauling field guns over soft land into any useful field of commerce because these tractors would scarcely be used under anything approaching parallel conditions in peace times. With the airplane the conversion is different. They all travel through the air. It will simply be a question of changing the arrangements for carrying the load and load space. A machine adapted for carrying large quantities of bombs can, without great difficulty, be converted into a plane suited for carrying mails or express. This service gives indication of being a channel through which quick use can be made of our great quantities of bombing planes that are now being planned to manufacture. It will also apply to the larger or super-bombers which may be brought out before the termination of the war.

Trade conditions between Europe and America, which are certain to follow the war, will be vastly altered because of airplane service. So far as commerce is concerned the week will be reduced to a day. Mails which formerly took a week from New York to London, Paris and Berlin will be carried in a day. Undoubtedly valuable express packages will be similarly accelerated in transit. It is almost impossible to conceive the advantage that one country will have which possesses such service on a commercial basis over other countries that are not prepared to meet it.

### Military Planes To Become Merchant Planes

Once the North Atlantic has been bridged, so to speak, by the airplane, a new military relationship will have been set up. The isolation of America by

the North Atlantic will have ceased to exist. Within 24 hours a hostile nation in Europe will be able to seriously injure, and to quite an extent destroy the industrial portions of some cities. America must build to meet these requirements. Military planes of today will be merchant planes of peace days.

American training planes flying in formation at Kelly Field, San Antonio, Tex.

# The Effect of Long Working Hours on Industrial Efficiency

Indications and Measurement of Fatigue—How Hourly and Total Output Have Been Increased by a Reduction of Hours of Labor—  
Some Recent British Experiments

**T**HAT the initial indications of fatigue and the correct measurement of its extent at any moment lie in its objective rather than in its subjective symptoms is one of the first principles of industrial efficiency in so far as it pertains to the individual operative. In determining when fatigue begins to affect the efficiency of an operative or a group of operatives or the amount that that efficiency has been impaired by it, the thing to be studied is not the operative but rather production, the output for some definite unit of time.

Before an operative *feels* tired physically or mentally he is tired industrially. His capacity to produce is reduced perceptibly before the subjective symptoms of fatigue are evident in his bodily sensations. Industrial fatigue is usually fatigue of the nervous system, not muscular fatigue, and it is caused not by the exhaustion of a latent supply of energy, as is sometimes thought, but rather by an accumulation of the products of chemical changes involved in physical exertion.

Fatigue is cumulative in effect, if sufficient rest intervals are not provided between periods of work. Opportunity must be given for the dissipation of the products

accumulated within the system during the hours of labor. Accumulated fatigue, the result of a continued overtaking of an individual's capacity, affects other portions of the nervous system and may cause, and usually does, a diminished quickness of response and a dulling of the senses of sight or hearing. These correlated symptoms indicate what is known as associated fatigue and are forerunners, not easily detected, of the more apparent indications of staleness which is commonly observed where hours of labor are too long, rest intervals too short and holidays or "days off" not sufficiently frequent.

Where staleness exists there will also be found poor "time-keeping," as the British call it, and a marked tendency toward a general indulgence in more strong drink than is good for the well-being of the worker.

It is because of these facts that beneficial results measured in terms of output capacity have been observed, in many cases, when the length of working hours has been reduced and the length of rest intervals and frequency of holidays increased.

In connection with munition work, the British Health of Munition Workers has made a most thorough study of

Case 1—Women turning fuse bodies

Case 2—Women cutting a screw thread

The four points in each of the three test periods on the two scales for each case are connected together by distinguishing lines, the lighter broken line being used to connect the points for the first period, the heavy broken line, to connect the points for the second period and the continuous line to connect the points for the third period. By following these lines the relationship of the nominal and actual hours of labor and the relative hourly and total outputs for each period may easily be observed and comparison made with the other periods

the effects of hours of labor on production and has developed some most interesting illustrations of what can be done toward increasing general industrial efficiency by decreasing the length of time during which operatives are called upon or permitted to work.

They had a good opportunity to make improvement in conditions as they existed at the time the tests were begun and to observe the effect, in extreme cases at least, of the scientific application of easily discovered physiological facts to the problem of obtaining industrial efficiency. It was common for men to work 14 hours a day for 6 days of the week and then work 10 hours or so on Sunday. Women worked 12 hours a day. The hours of labor were so long when the country awoke to a realization of the fact that productive efficiency was being seriously impaired that the committee, in recommending a working week not to exceed 65 to 67 hours for men and 60 hours for women was urging such a material reduction that those not familiar with the reasons which prompted the recommendations felt that output would be sure to suffer.

Several concrete cases illustrating how both hourly output and total output were actually increased when the number of hours of the working week were reduced are shown on these pages by means of charts and comparative lines drawn to scale to represent relative lengths of working periods and quantities of output.

Even though we have long known that "all work and no play makes Jack a dull boy," the results obtained in some of these cases are little short of startling. This is true not only of the way in which output rate and total output increased when working hours were shortened, but in one of the cases it is also true of the manner in which the difference between nominal and working hours became smaller. In this particular case, which is that of men doing heavy work, there was a slight increase of actual hours of labor when the nominal hours were reduced below a certain point. Owing to a discontinuance of Sunday work, the general attendance of the operatives was

Showing the relationship of the actual working hours per week to the nominal as the number of hours in the working week was reduced in each of the four cases here considered

so much improved that the average for the actual hours worked was higher than it had been before.

It is not at all likely that we can secure so great a benefit from a reduction of working hours as they did in Great Britain because of the fact that our hours of labor are less per week on the average than they were and still are there. But there is food for serious thought in the experience of our British brothers and the suggestion, at least, that by giving more study to our own individual cases with British experiences in mind, we may be able still further to increase our industrial efficiency or at least

Case 3—Men engaged in heavy work

The same kinds of distinguishing lines are used in the diagrams above to connect the four points for each of the three test periods as are used in the illustrations for cases 1 and 2. The light broken line indicates the first period, the heavy broken line, the second period, and the continuous line the third period

Case 4—Boys boring top caps

avoid falling, as they did, into the mistaken belief that the way to increase output is to work longer on the job.

The data used in all of the cases taken up in the diagrams accompanying were gathered in large and recently constructed munitions plants in which the working conditions were as good as they are anywhere today. The lighting, heating and ventilation were provided by modern equipment and were regarded as fully adequate according to present standards. There were canteens where refreshments were obtainable and opportunity was provided for their use. All the operatives included were on piecework at a high rate and were not under trade union restrictions as to output. There was therefore every inducement and favorable conditions as to environment for maximum production.

In the first case women were engaged in turning aluminum fuse bodies which is rated as "moderately heavy labor." They stood all day at turret lathes and performed seven boring and cutting operations on each piece. The work required close and constant attention as much of it was of a delicate character and as a result there was no great opportunity for relaxation. One hundred women, each of whom had reached maximum production after approximately 3 weeks' training and some experience in the production department and had worked during at least 15 of the 24 weeks over which the tests extended, were included. Before the period during which the tests were made, working hours had usually been between 75 and 80 per week with no Sunday work in the second week of each month. In the case under consideration the first period was made up of 6 weeks and there was Sunday labor in five of them. During the second period of 8 weeks the women worked on three Sundays for a few hours each. Unfortunately for some reason the attendance was extremely poor during the third period, so much so that while the hourly output rate increased from 134 to 158, a jump of nearly 18 per cent, the relative total output fell from 111 to 109. If the ratio of actual hours to the nominal of the second period had been maintained in the third, and there seems to be no particular reason why it should not have been, the relative total output would have been increased from 111 for the second period to 117 for the third.

It was the conclusion of the committee that "a 50-hour week yields as good an output as a 66-hour week and a considerably better one than a 75-hour week" when women are engaged in moderately heavy lathe work.

We have, in the second case, an instance in which the rate of output is largely regulated by the speed of the machines employed. For four-fifths of the time the operatives stood idly by watching their semi-automatic machines run. Every minute or so they removed one fuse body and inserted a new one, an operation which required only a few seconds. The work was light and called for but little physical exertion and not such close application as did the turning of the fuse bodies considered in the first case. The period of this test was 24 weeks also and the work of twenty-one women was included. The hourly output varied very much as it did in the first case, but not to so great an extent, because, as has been pointed out, the speed of the machine was practically the determining factor.

It is in the third case—that of men engaged in heavy work—that the most interesting results were obtained. The work consisted of sizing fuse bodies. It is considered one of the most fatiguing kinds of munition work. Each piece is subjected to four separate operations. While no particular skill is required, a heavy continuous strain is imposed on the muscles of one arm and shoulder and also on the back. The lifting of the pieces is almost always done with one hand as the operators prefer to keep the

other hand dry as it is used for running a tap through the piece to cut a thread and the oily condition of the piece makes it harder to do this if both hands are used in lifting it. The averages of twenty-seven men were used in making the calculations in this case.

A most interesting point in this case is that in spite of the fact that the nominal hours were reduced in the third period, the actual hours worked were more than they were in the second period. There were also some remarkable increases in relative hourly and total output. It will be noted that the relative hourly output increased from 100 to 122 and then to 139 when the nominal hours were reduced from 66.7 to 62.8 and then to 56.5 and that the relative total output increased from 100 to 106 and then to 122, the latter unusual jump being due in part to the increase in the actual hours worked.

As only seventeen boys of from 15 to 18 years of age were included in the fourth case the data derived are not so comprehensive. The process on which the boys were engaged, namely, boring top caps, involved the use of semi-automatic machines and the speed of these machines very largely determined the rate of output. There were two clamping and unclamping operations every 15 seconds and these operations consumed about 2 seconds. A substantial increase was noted in relative hourly output with a reduction of hours of labor, but because attendance fell off for some unaccountable reason during the second period the relative total output also showed a decrease. In the third period with practically no change in hours from the second, the relative total output very closely approached that of the maximum working period.

These and other similar tests convinced the British authorities that reductions of from 7 to 20 hours per week could be made below what had been considered the necessary working schedules for maximum production without loss of total output. They have accordingly revised their schedules and production is again expressed by an upward curve.

## Anti-Rattling Door Lock

THE Ottinger anti-rattling device as incorporated in some of the locks manufactured by the English & Mersick Co., is designed to prevent door rattle without the use of rubber bumpers on the jamb. It consists of a cam inserted in the bolt, and the ejecting pressure behind the bolt is utilized to force the cam against the holding portion of the striker.

At the beginning of its movement the cam is embedded in the bolt so that there is no pressure to be overcome in opening or closing the door except that behind the bolt. It is not necessary to slam the door. As the bolt passes behind the striker the inner end of the cam is forced in and the outer end emerges from its recess in the bolt until it bears tightly on the striker, thus holding the door firmly.

*With the aid of a lifting jack, women are able to work efficiently in the tire-finishing department of the Morgan & Wright plant*

**A**T the plant of Morgan & Wright, in Detroit—a branch of the U. S. Tire Co.—women are employed in many departments where the work done taxed the endurance of the strong, able-bodied men who formerly did it. On the heavier work they are found not quite so efficient as men, but the company has been obliged to use them on such work because of the shortage of male help. All together there are employed in this plant 500 women who have taken the places of men, and it is the general opinion of those in charge of the various departments that they do the work better than the men did.

Through its development department the company is constantly improving its equipment with a view to reducing physical exertion as much as possible, not only for the benefit of the women but for the men as well. This improved equipment has already enabled the company to place women on certain kinds of work which were formerly of a character altogether too strenuous for them.

A trip through the factory discloses women engaged in a wide variety of occupations. They work in the tire-finishing room, in the flap department, in the wire room, in the department where cord tires are made, in the shipping room and warehouse; they make beads for tires, and work in various other capacities.

A striking example of what women can do in the way of hard physical labor is provided in the final inspection room. Here a pile of heavy tires is deposited at the feet of the women, from which they take one at a time and place it upright upon two large spools sunk in a table before which they work. The tires are revolved on the spools and carefully inspected for defects. The operation is repeated to inspect the other side, after which the tire is properly stamped and thrown on another pile.

Despite the fact that the weights of the tires vary

## Improved Equipment of Additional

**Morgan & Wright Have Installed Many**

from 14 to 20 lb. each, and that an average worker handles between 400 and 500 tires a day, the women find very little difficulty in the work. They lift nearly 8000 lb., or 4 tons, daily, and when it is remembered that this is only half of the operation, that it is necessary to throw the tires again on another pile after inspection, the task seems astounding. Yet they manage it with apparent ease.

With the aid of a lifting jack—a device developed from an idea of an employee—the physical effort required for the work in the finishing room was reduced to such a degree that the company was enabled to place women at work there. It may be mentioned here that the company encourages employees to make suggestions that facilitate work or result in its being done more efficiently. Awards are offered for the best suggestions.

The work in the tire-finishing department consists of applying several strips of fabric and gum over the tires as they come from the tire building room. Only 3, 3½ and 4-in. sizes are handled by women. The tires are brought into the department on trucks which are fitted with T-shaped steel uprights from which the tires are suspended. When the worker is ready to start on a new tire she approaches the loaded truck with a lifting jack.

As the worker turns a wheel at one side of the jack an arm is raised. This is guided under the nearest tire, lifting it off the T-shaped fixture on the truck. The lift-

*When the tires are adjusted on the finishing buck, the worker is ready to apply three plies and four gum strips entirely by hand*

## mits Employment men Workers

### g Devices to Lighten Their Work

vice, which is mounted on casters, is then pushed to the worker's bench; the tire is lowered, and transferred to a finishing buck—a steel wheel having weighted spokes. When properly adjusted on the finishing buck the woman starts at once to apply various strips of fabric. After three plies have been put on, four strips are next applied, the last of which is the

these operations are performed by hand. As each is applied the finishing buck is given a vigorous causing it to revolve. While thus in motion a is held against the strip for the purpose of making it adhere securely. The edges are then cut off with a sharp knife. The next six layers are applied in the same manner. The lifting jack is again used in removing the tire and placing it on a truck.

is work was formerly done entirely by men; in fact, men have not replaced all the men in this department. There are still a number of men employed at this work. It is in this department that women were first introduced in the plant. This was in May, 1917, when several were taken on. They proved so satisfactory that the company was encouraged to add more from time to time, and now there are a large number engaged in this department each shift.

in connection with  
women are

in the tire-finishing department to supply the workers

with stock. It is necessary for these stock girls, as they may be called, to be extremely familiar with the various kinds of strips and their names, so that when a worker calls for a certain kind there will be no delay in supplying him or her with the required piece. Women have completely replaced men in this line of work; they supply stock to men as well as to the women. This work is comparatively light, and can be performed satisfactorily.

To give the reader a clearer conception of the operator's work in the wire room, where the basis for beads is made, it may be well to first describe the machine on which the operation is performed.

The machine wraps with tape a coil of wire which passes over two spools, one above the other. In order to keep the wire taut while in the process of being wrapped, there must be a tension between the spools. This is accomplished at the will of the operator, who sits on a seat at the end of a bar projecting from the machine. This seat acts in conjunction with the lower spool. As the operator sits down her weight bears down on the bar and simultaneously lowers the spool. When the bar is relieved of its weight, or, in other words, when the operator rises off the seat, the bar springs up, causing the spool to slide upward.

The spools must be in this relieved position to permit the coil of wire to be put over them. As soon as it is adjusted, the operator sits down, tightening the coil over the spools, and commences the operation of winding. Then the operator is obliged to stand up again before she can disengage the wrapped coil.

It takes less than 10 seconds to wrap a coil and about as long to release the finished coil and adjust a new one. This means that the operator must sit down and jump up once every 20 seconds, or three times a minute. This is

*In the inspection room women examine first one side and then the other of each tire*

equal to 180 times an hour, and, estimated on an 8-hr. basis, amounts to 1280 times that a woman must move up and down during a day's work. Women are as efficient as men in this work and are very rapid.

The coils of wire are made and soldered by women in the same room. The coiling is done by an operator in a standing position, while the work of soldering is accomplished by a seated worker.

The next two steps in the manufacture of beads, wrapping and trimming, are also performed by women. About six persons are used on this work in one shift.

Many women are employed in the pocket department, the latest department to experiment with the use of female labor. The most difficult task in this department is that of carrying what are called books. These consist of a supply of fabric for cord tires, placed in layers on boards about 8 ft. long. At first, every worker was obliged to handle her own supply of books. The women—one at each end—would carry these from the source of supply to their racks, but it was found later that this work was too heavy for women, so men are now used to carry the books for the women as they require them.

#### **Work of Heavy Character**

The work in this department consists of taking a piece of fabric from a book, cutting it the required length, and stretching it over a large drum of equal circumference, one layer over another, until a certain thickness is attained. These bands are then removed from the drum and conveyed to another department, where they are put over a tire core by men.

In other departments where women are employed the work is of lighter character. A number of women are engaged in the cutting of treads; several are used to trim the uneven fabric edges from the rubber tread, while others cement the ends together; another group makes patches for repair kits; still others stamp sizes and names on inner tubes, and others work in the packing room, where the product is boxed.

A great number of women are engaged as inspectors in numerous departments. As the finished casings are finally inspected they are sent to women who check their serial numbers and weigh each tire.

The company made extensive experiments with the training of help for the various kinds of work. Two years ago, with the training of men in mind, it estab-

lished a vestibule school, but after 6 months' trial it was abandoned. It did not prove successful. Despite the fact that the vestibule idea is working to advantage in machine shops, it is felt by the company that it cannot be made to operate efficiently in the rubber industry. At the Morgan & Wright plant it was found better to train students among the other workers. The students develop faster, and have a greater opportunity to grasp efficient methods and acquire short cuts, which come to them more slowly in the vestibule school.

It was noted that students graduating from the school, when entering regular production, could not keep up with the supply of work; they were always behind. As they are now trained—with the regular workers—women are taken out of the student class after 6 or 7 weeks. It has been found that

they are much quicker to learn than men.

Excepting the students, the women get the same rate of pay as the men, but in the aggregate their earnings are slightly less. In a number of instances, however, they receive in their pay envelopes as much as some men. Women have a greater number of actual working hours to their credit than men; they are much steadier. They work the same 8-hr. shifts as men.

Great care is exercised in the selection of women. Both the employment manager and the matron interview them. After being hired, a woman is taken by the matron to the department where she is assigned to work, and is made to feel as much at home as possible. There are two matrons, one for night duty, the other for day. The matron always aims to be with the girls at lunch hour. Special rest and locker rooms are provided, to which the women may retire at any time during their working hours.

## **Employee Group Insurance**

**U**NDER the shifting conditions existing to-day the employer is ready to adopt any good plan that promises to keep down his labor turnover. One of the latest and most popular forms of welfare work is group insurance. This new form of insurance was launched early in 1911.

Group insurance has been called "an employer-employee mutual benefit proposition," says a report of the Committee on Industrial Betterment of the National Association of Manufacturers. The plan contemplates that the employer shall insure his whole body of employees, as a group, bearing the entire cost of carrying the insurance, which is made especially low. If the group includes more than 100 a medical examination is not required. Of course, there must be no unusual hazards in the business, the factory conditions must be wholesome and the risks as a whole desirable.

Since the employer pays the insurance premium, the workman loses his insurance when he leaves his job. The new workman takes on insurance with his new position.

The unit for group insurance may be the year's salary or earnings up to \$3,000 for any individual. It may be arranged for the beneficiary to receive this in twelve monthly payments, thus continuing the family income for a year after the death of the worker. Instead of the salary unit a fixed amount, as \$500 or \$1,000 may be taken for each individual. Where the smaller unit is taken there is usually a provision to increase the benefit \$100 with each year of service until a certain limit has been reached.

# A New Chassis Lubrication System

A Scheme by Which Oil Is Fed to Bearings by Wicks—Quantity Fed Is Regulated by Localized Compression of the Wicks—Large Supply of the Lubricant Easily Carried

**F**OR some time it has been apparent that a better lubricant than grease is desirable for such parts of passenger cars and trucks as spring bolts, brake shafts, brake connections, radius rod connections, drag links, spring shackles, etc.

The tendency of grease to harden in its way with age, as well as its tendency to take the path of least resistance when forced by pressure to bearing surfaces, have been serious drawbacks to its use as a chassis lubricant. The grease works out of the bearing, possibly at one of the ends, without being

distributed over the surfaces to be lubricated, and it also works out of the grease cup around the cap.

Some of the materials used in making grease have very small lubricating value, if any, which means that not all of the material fed to bearing surfaces serves to lubricate them. A considerable amount of dirt of one kind or another is usually fed to the surfaces to be lubricated with the grease and, owing to the conventional manner of exposing the grease containers, in shops and garages, the efficiency of grease is farther reduced. There are other inconveniences connected with the use of grease. So many grease cups used on passenger cars and trucks are located so inaccessibly that they are slighted even by operators attempting to take proper care of them. It is a very laborious task to keep grease cups filled, and to screw them down as required, owing to the many points to be lubricated. These various difficulties have led many to investigate oil as a chassis lubricant, with a view to cutting down the number of points to be looked after in keeping a chassis lubricated, to secure capacity for lubricants to last a comparatively long time, and also to secure a lubricant that has a higher efficiency than grease.

## Oil Not an Ideal Lubricant

Oil, while not an ideal chassis lubricant, possesses a certain number of outstanding characteristics that are not to be found in grease. It is easily distributed over bearing surfaces, is capable of sustaining very heavy bearing loads, reduces friction to a minimum, and is generally a better lubricant than grease. It can be fed in proportion to requirements, tending toward automatic lubrication; it admits of greater cleanliness; if necessary, sufficient lubricant can be carried for several weeks' requirement, and the same oil as used in the engine can be used throughout the car.

The chassis lubrication scheme illustrated by the accompanying drawings has been evolved by Carl S. Peterson, chief

Fig. 1—Clutch and brake assembly showing four bearing surfaces lubricated from same reservoir with one point of filling

Fig. 2—Clutch throw-out yoke assembly showing how two bearings and two clutch throw-out rollers are lubricated from one reservoir with one point of filling

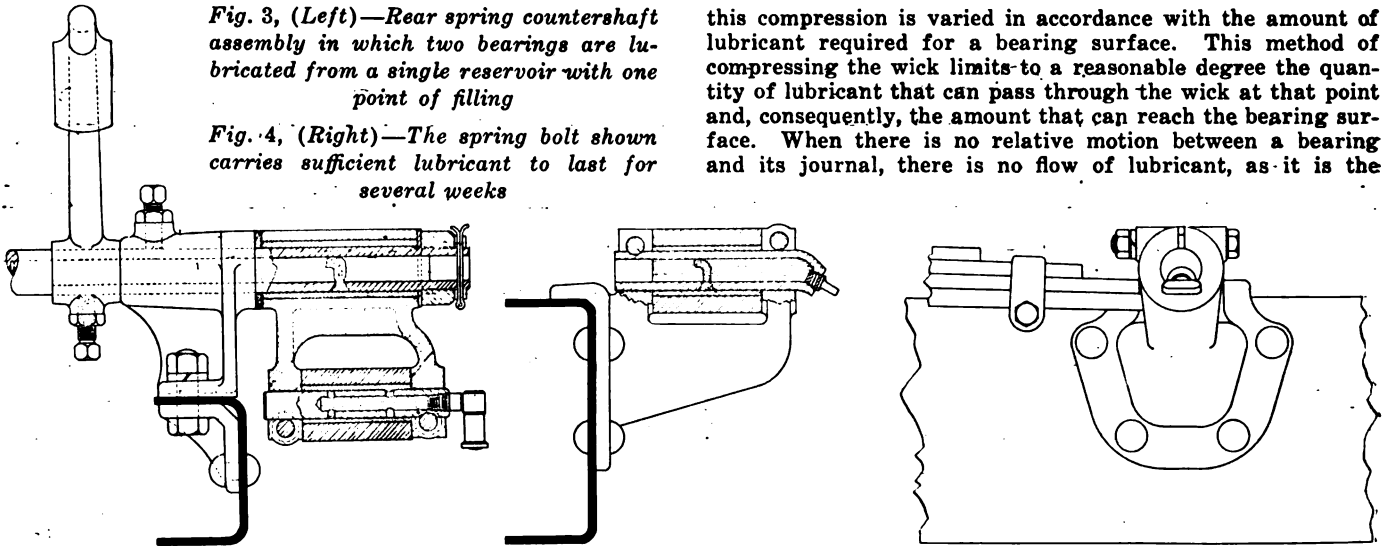

Fig. 5—The brake countershaft assembly in which oil is employed as a lubricant

Fig. 3, (Left)—Rear spring countershaft assembly in which two bearings are lubricated from a single reservoir with one point of filling

Fig. 4, (Right)—The spring bolt shown carries sufficient lubricant to last for several weeks

engineer of the Lippard-Stewart Motor Car Co., Buffalo, N. Y. The system consists of a wick suspended in a reservoir of oil through a conical shaped hole, which reservoir is formed in the hollow part of a tubular shaft or cast integral with frame brackets, etc. The sharp edge formed at the small diameter of the conical hole acts as a barb that grips the wicks tightly and makes it impossible to pull them out from the outside without destroying them. It holds the wick so firmly that it is quite hard to push it into the reservoir. It is claimed that a wick will stay in position always when once properly applied.

#### Oil Fed by Capillary Attraction

The oil is fed to the surfaces to be lubricated by means of capillary attraction, yet the amount supplied can be regulated. The point where the sharp edge of the small diameter of the conical hole grips the wick compresses it, and

this compression is varied in accordance with the amount of lubricant required for a bearing surface. This method of compressing the wick limits to a reasonable degree the quantity of lubricant that can pass through the wick at that point and, consequently, the amount that can reach the bearing surface. When there is no relative motion between a bearing and its journal, there is no flow of lubricant, as it is the

#### Grease Cups Eliminated

On one model of truck where this lubrication scheme is now used, 18 grease cups are eliminated. These were located under the foot boards. The points at which the lubricant has to be replenished are reduced to 5, and these are all located outside the frame.

Fig. 5 shows the brake countershaft assembly for a truck that does not employ the same scheme for feeding the oil to the bearing as just described, but is interesting in that oil is employed for lubrication. The trunnion bearings shown eliminate any chance of the brake countershaft and tube binding from frame weave when the truck is passing over irregular road surfaces.

## Golden, Belknap & Swartz Plate Clutch

A PLATE clutch running in oil has been brought out by the Golden, Belknap & Swartz Co. of Detroit. As shown in the sectional view herewith, the flywheel web forms one of the driving members, the other being constituted by a plate adapted to move endwise on keys secured to the inside of the flywheel rim. Between these driving members are located the driven steel disk and two rings of wire woven asbestos. The clutch disks are clamped together by three radially disposed double armed levers which are pivoted on the driving ring. Their outer end takes purchase against the inner edge of the clutch cover, and their inner end rests in a groove on the clutch control sleeve which is pressed into the position of engagement by a heavy volute spring inside the clutch cover. The clutch sleeve passes through a central opening in the cover and at its outer end carries a nut against which bears the clutch control collar. The clutch can be adjusted for wear by screwing the cover farther into the flywheel rim and this adjustment can be locked.

ONE result of the war is likely to be the forcing of Spain into the ranks of producers of ferromanganese. By a recent Anglo-Spanish agreement it was stipulated that Great Britain should supply to Spain ferromanganese to the extent of 120 tons per month, which was shared among the various producers of steel. Deliveries were interrupted by the war, and in consequence some six electrometallurgical companies took steps to produce the article themselves. The companies indicated are the Altos Hornos de Viscaya, the San Francisco del Desierto, the Fabrica de Mieres, the Altos Horno de Malaga, the Fabrica de la Senora Urigoitia in Araya, and the Metalurgica Duro-Felgueta.

# Electric Steel Making\*

Shutting Off of Foreign Supply Has Developed Industry in America—Production in 1917—Cold Melt and Electrically Refined Steel—Details of the Heroult Process

By Arthur V. Farr

**I**T would seem that a word of appreciation is due the forging industry of this country for the co-operation extended to the American steel manufacturers, especially apparent since the beginning of the war. The cutting off of the steel supply from abroad made it necessary for American manufacturers to make steel which had previously been imported. The assistance rendered the steel manufacturers by the forging concerns during the first attempts at making these steels (many of them complicated alloys requiring special manufacturing methods) has proved invaluable.

We believe that this co-operation has reacted favorably on the American forging industry, enabling it to serve most effectively our military requirements, the automotive and allied industries, and to render a service that has prevented any lessening of quality or production. I quote from a report that I wrote less than a year ago, following a visit to a large forging company: "They inform me that they are now get-

ting better steel than they ever got from Germany, better in uniformity and better in physical results after heat treatment. They say that they will never go back to foreign steels." I doubt not but that this experience has been typical of a large number of forging companies during the last three years. Certain it is that the full exchange of ideas, criticisms and suggestions between forger and steel maker has enabled the forger to get a domestic source of supply and

\*Paper presented at the fifth annual meeting of the American Drop Forge Association, Buffalo, June 21st, 1918. The author is the sales manager of The Hess Steel Corporation, Baltimore, Md.

"Slagging off." Above: Pouring the ingots

Battery of 6-ton electric furnaces. Samples showing qualities of electric steel

to meet the exacting requirements of the day on a better basis than ever before.

America has been known as a producer of steel in quantity, and it has been but recently that the *quality* element has been emphasized. The continued production of quality steels is making America's reputation symbolic of both quantity and quality.

#### U. S. Leads in Production

A new-comer in the industry and a factor in the production of higher grade steels is the electric furnace method of production. Starting with 10 electric furnaces in 1910, the growth in the number of installations has been rapid, until May 1, 1918, saw 239 furnaces either in operation or in the course of construction in this country, with a production for 1917 of 235,000 gross tons. The United States has not only maintained its commanding position as a producer of electric steel, but the record of 1917 emphasizes this leadership. The United States and Canada are producing at the present time probably a little less than half of the world's output.

The industry has grown so rapidly and has become so important a factor in the forging industry that it might be advisable to review briefly the method of making electric steel and to call attention to some of the salient qualities of the product of the electric furnace as applied to the forging industry.

Electric steel is made either by melting a cold charge and refining it in the electric furnace, known as "cold melt electric steel," or by refining in the electric furnace the molten charge from the open hearth or Bessemer or a combination of both. This latter method is applicable especially to furnaces of capacity of ten tons and upward, the cold melt method not having proved successful to date in the large units.

#### Cold Melt Method for Small Units

For units of less than ten tons capacity the cold melt method predominates. This is due largely to the simplification of equipment and the assurance of electric steel quality. Although there is economy in duplex or triplex methods of making electric steel, certain it is that plants equipped exclusively with electric furnaces cannot be accused of merely "washing" the open-hearth steel in the electric furnace. It cannot be gainsaid that satisfactory steel can be produced by the open hearth electric furnace method, provided, of course, that sufficient time is allowed for refining in the electric furnace. Perhaps this point is best illustrated by the present-day attitude taken by some steel purchasers. A request for quotation was sent by a large purchaser of chrome steel and contained the following: "If you are not in position to quote on either electric or crucible steel, we prefer that you disregard the inquiry, as we do not care to consider open-hearth steel or open-hearth with electric furnace refinement." While this attitude cannot be considered as typical, it shows the discrimination that particular purchasers have found necessary to exercise in safeguarding the quality of their product.

The electric furnace, as known in this country, is a metallurgical instrument for the making of steel by means of electric arcs formed between electrodes or between electrodes and the metal bath. It consists essentially of a steel tank lined with refractory materials and fitted with working doors, spout and tilting arrangements for pouring and slagging off. Carbon or graphite electrodes of suitable section are inserted through the roof or sides and are adjustable. A high-tension electrical supply is brought into a transformer house adjoining the furnace and transformed down to about 100 volts for use at the electrodes.

The heat generated by the electric arcs makes possible any desired temperature up to the fusion point of the best refractory materials. The temperature in the furnace is under the control of the operator, and it is changed as the refinement of the steel progresses.

We will describe briefly the method of manufacture of cold melt electric steel in a 6-ton Heroult electric furnace, which is representative of the majority of installations in this country.

#### Process Divides Into Two Periods

The process of manufacture may be divided into two periods, namely, (1) melting and oxidizing, and (2) recarburizing and reducing.

It appears paradoxical to remove carbon during one period and add it during another, but this is necessary in order to oxidize the phosphorus. Furnaces for reducing phosphorus are lined with basic material, such as magnesite or dolomite. Limestone is charged into the furnace with the scrap. The rust on the scrap furnishes the oxygen, and sometimes ore or roll scale is charged to augment this supply. The slag formed oxidizes the phosphorus which then combines with the lime, forming calcium phosphate. Carbon, silicon, manganese and sulphur are also oxidized to a greater or less extent by this slag.

As an illustration of the furnace reactions that take place the following schedule is given, showing the various stages in the making of a heat of electric steel. The steel to be made was a high carbon chrome steel used for balls for ball bearings.

#### Furnace, 6-ton Heroult

11.50 a. m. Material charged.	
Boiler plate .....	5980 lb.
Stampings .....	5991 lb.
	11971 lb.
Limestone .....	700 lb.
12.20 p. m. Completed charging.	
(Current switched on.)	
3.20 p. m. Charge melted down.	
Preliminary analysis under black slag analysis:	
C. Si. Su. Ph. Mn.	
.06 .014 .032 .009 .08	

3.40 p. m. The oxidizing (black) slag is now poured and skimmed off as clean as possible to prevent re-phosphorizing and to permit of adding carbonizing materials. For this purpose carbon is added in the form of powdered coke, ground electrodes or other forms of pure carbon.

#### Deoxidizing Process

The deoxidizing slag is now formed by additions of lime, coke and fluorspar (and for some analyses ferrosilicon). The slag changes from black to white as the metallic oxides are reduced by these deoxidizing additions, and the reduced metals return to the bath. A good finishing slag is creamy white, porous and viscous. After the slag becomes white some time is necessary for the absorption of the sulphur in the bath by the slag.

The action of desulphurization in the electric furnace is as follows:

After the bath is oxidized as described above the slag acts on the metallic sulphides, eliminating them by forming calcium sulphide, which is taken up by the slag. The desulphurizing actions are illustrated by the following equations:

The white slag disintegrates to a powder when exposed to the atmosphere and has a pronounced odor of acetylene when wet.

Further additions of recarburizing material are made as needed to meet the analysis. The further reactions are shown by the following:

3.40 p. m. Recarburizing material added.

130 lb. ground electrodes,  
25 lb. ferromanganese.

Analysis:

C.	Si.	Su.	Ph.	Mn.
0.76	0.011	0.030	0.008	0.26

To form white slag there was added:

225 lb. lime,  
75 lb. powdered coke,  
55 lb. fluorspar.

4.50 p. m. Analysis:

C.	Si.	Su.	Ph.	Mn.
0.75	0.014	0.012	0.008	0.28

Note the reduction of the sulphur content.

During the white slag period the following alloying additions were made:

500 lb. pig iron,  
80 lb. ferrosilicon,  
9 lb. ferromanganese,  
146 lb. 6 per cent carbon ferrochrome.

The furnace is now rotated forward to an inclined position and the charge poured into the ladle, from which in turn it is poured into molds.

5.40 p. m. Heat poured.

Analysis:

C.	Si.	Su.	Ph.	Mn.	Cr.
0.97	0.25	0.014	0.013	0.33	0.70
Ingot weight poured .... 94 per cent					
Scull ..... 2.7 per cent					
Loss ..... 3.3 per cent					

Total current consumption for the heat, 4700 kilowatt-hours, or 710 kilowatt-hours per ton.

#### Ingot Cast in Inverted Molds

Electric steel, because of its density, should be cast in inverted molds with refractory hot top to prevent any possibility of pipage in the body of the ingot. In the further processing of the ingot, whether in the rolling mill or forge, special precautions are taken in the heating, in the reduction of the metal and in the cooling.

There is a growing tendency for forging concerns to demand to know the structure of the steel that they are using. This is distinctly a forward step and points the way to accurate heat treatments and more satisfactory results. The demands of high power guns, airplane engines with weight well below three pounds per horsepower, safe, lightweight automobiles, all necessitate the use of the proper kind and

weight of steel. These results can only be obtained by the use of properly selected grades. (In line with this tendency, it may be interesting to examine at close range some typical cold melt electric steels. The results indicated are average and such as can be obtained or improved upon in practical experience.)

In this paper no attempt has been made to compare at length the relative merits of open hearth and electric steel. I do not believe that is necessary, because results in service, day in and day out, have thoroughly established the superiority of electric steel. Individual laboratory tests do not always square with results in the field, but it is the latter that are wanted. One forger expresses his experience tersely as follows: "We can get physical properties much easier with electric steel." Ten years of experience in this country and in Europe indicate that electric steel in its natural qualities is equal to crucible steel and superior to the steel ordinarily made in the open hearth.

The rare purity of the heat derived from the electric arc, combined with definite control of the slag in a neutral atmosphere, explain in part the superiority of electric steel. Commenting on this recently, Dr. H. M. Howe stated that in the open hearth process you have such atmosphere and slag as you can get, and in the electric you have such atmosphere and slag conditions as you desire.

The ultimate consumer in a large measure is the court of last resort, determining what steels shall be used in the manufacture of his product. It is the ultimate consumer who realizes that the best materials obtainable are none too good, and the drop forger, knowing this and that the difference in cost of steels is small compared with the labor, forging equipment and after expense put upon forgings, finds that it is economy to use high grade electric steel.

The question "What will the forging business be after the war?" is one that the American forging industry is facing to-day. Reports that Germany is exhausted, that her working men are anemic from starvation, that her railroads and manufacturing plants are run down, and that she will be far behind when the commercial race begins after the war, may well be suspected of being a rather coarse form of German propaganda. War, instead of exhausting Germany's industrial and trading potentialities, has actually organized Germany for commerce. The vast majority of the plants that are working to capacity on wartime production can be turned promptly to commercial production. It seems safe to expect that we will have keen competition to face after the war.

# How Moisture Affects the Strength of Aircraft Fabrics\*

Tests on Cotton, Linen, Balloon Fabric, Tire Fabric and Cords—Variations in Tensile Strength With Differences of Moisture Regain

By G. B. Haven

IT is a well-known fact that cotton and linen are hygroscopic to a marked degree, gathering to themselves automatically a large percentage of their dry weight in the form of moisture. The effect of this "regain" upon the tensile strength is very pronounced. In thick, heavy fabrics such as those used for tires, the strength may be augmented to the extent of 50 per cent or more by the presence of this moisture of regain. In light wing fabric the increase is naturally of less amount, but there is, however, a decided effect in all of these fabrics from this cause.

It is the object of this paper to describe a series of experiments conducted by the author with the able assistance of Mr. Philip O. Yeaton of the Mechanical Engineering staff at the Institute of Technology. All of the work here described was performed in the Textile Testing Laboratory within the last year and forms part of the course of instruction given to detachments of the navy, studying airplanes at the institute.

## Description of Fabrics

Five fabrics may be classed under the general title, "Aircraft Fabrics":

(a) *Wing Cotton*.—Two classes of cotton wing fabric are advocated by the United States Government bureaus, one woven of two-ply No. 60 yarn and the other of three-ply No. 80 yarn. The weight of these fabrics is from 4 to 4.5 oz. per sq. yd. The yarn is generally mercerized under tension and from 70 to 80 threads per inch of width are employed in both warp and filling. The following tests were made upon the three-ply No. 80 mercerized fabric having a weight of approximately 4 oz. per sq. yd.

(b) *Wing Linen*.—The wing linen imported into this country from Ireland, France and Belgium has generally about 94 threads per inch in warp and filling and weighs about 3½ oz. per sq. yd. It passes from a creamy white color to a dull brown and may be found in grades much heavier than the above.

(c) *Balloon Fabric*.—Balloon fabric is made by calendering and vulcanizing thin sheets of para rubber upon fine cotton cloth. One, two or three plies of cloth may be employed.

\*Abstract of paper read before the American Society for Testing Materials.

Fig. 1

Fig. 2

With two or three plies, the direction of the threads in the fabrics is made to form an angle of 45 deg. with one another in order to localize tears. The cloth count varies from 120 to 160 threads per inch of width in warp and filling. That used in the following tests had quite uniformly 133 threads per inch in warp and filling. The fabric was two-ply with a nominal weight of 11 oz. per sq. yd. Other fabrics of this class range from 4 to 15 oz. per sq. yd. The ply which has its warp threads in the direction of the length of the fabric as rolled is called the "parallel-ply" and the one with its threads at 45 deg. with the roll length, the "bias-ply."

(d) *Tire Fabric*.—Woven tire fabric has been widely standardized with 23 threads per inch of width in warp and filling. The threads are made of No. 23 yarn plied eleven times. The weight is generally 17¼ oz. per sq. yd.

(e) *Cords*.—Cord tire fabric, or "cords" as it is frequently called, has 23 warp threads per inch of width. These cords are cabled, that is, made up of three strands, and each strand of five primary No. 23 yarns. Thus the warp threads are virtually 15-ply yarns. In order to assemble the warp threads or cords in order, filling threads of single No. 23 yarn are inserted to the number of 2½ per inch. The warp threads are thus loosely held in order until placed in the tire. The weight of this fabric is about 10.1 oz. per sq. yd.

The highest grades of cotton are used in all these fabrics. Sea Island, imported and domestic Egyptian and the better classes of Peeler are generally specified. The cotton is generally combed in process of manufacture.

The facilities of the Institute of Technology for research in this direction are as follows:

(a) A testing room of about 5000 cu. ft. capacity, with

heavy concrete walls and floors and tight doors and windows.

(b) A Park's humidifying system in the testing room with automatic control. This apparatus will raise the humidity to a set figure and hold it there with but little variation.

(c) An Emerson electric conditioning oven with thermostat control. The latter is adjustable to any reasonable figure and has a limit of variation of 2 deg. Fahr. plus and minus. The oven contains eight aluminum weighing baskets carried on turntables. On the oven roof is mounted a pair of fine balances weighing to 0.1 grain. Any basket may be linked to the scale pan and weighed without opening the oven door. The links and baskets are tared by dead weights on the scales so that the net weight of the sample is obtained without subtraction. The oven is thoroughly ventilated while in operation.

(d) Three Scott testing machines were employed, having capacities ranging from 50 to 800 lb. The clamp jaws were of the flat-hinged type wider in all cases than the strip of fabric under test. The distance from the machines to the oven door was 3, 6 and 8 ft. respectively. The speed of the testing machine jaws was 12 in. per minute in all cases.

(e) *Balances.*—All the weighings for the plots were made on Becker Analytical balances to 0.01 grain. Great care was expended in securing the last significant figure in the weighings.

(f) *Weighing Bottles.*—In order to hold specimens at stable humidity while weighing, bottles of thin glass with airtight ground-glass stoppers were employed. Their capacity was 40 cc. and they easily accommodated four or five of the strips to be tested.

(g) *Wet Room.*—Where extremely high humidity regains were desired, recourse was had to a room without windows in the basement of the institute. This room is kept continually as near 100 per cent relative humidity as possible by an American humidifier. In the exposures made in these tests the apparatus was shut down to avoid spray until the relative humidity was not over 95 per cent. The specimens were hung 6 ft. away from and 2 ft. above the level of the humidifier.

In addition to the above, the usual complement of cutting, counting and measuring apparatus was available. All the specimens were accurately measured off in width by means of a Lowinson thread micrometer over an illuminated field of ground glass.

#### Specimens

All the specimens were cut to the definite length and width given in Table I.

TABLE 1—DIMENSIONS OF SPECIMENS

Kind of Fabric	Specimen		Raveled to	Distance Between Jaws, in.
	Length, in.	Width, in.		
Wing cotton	7	1 1/4	1 in.	3
Wing linen	7	1 1/4	1 in.	3
Balloon	6	1 1/2	Not raveled	3
Woven tire	7	1 1/2	23 threads	3
Cords	16	One cord		10

Preliminary tests developed the following facts:

1—The duration of heat in the oven effects the tensile strength of balloon fabric and woven tire fabric as shown in Table II.

TABLE 2—EFFECT OF HEAT ON TENSILE STRENGTH OF COTTON FABRICS; OVEN TEMPERATURE 220-230° F. Average Tensile Strength, lb.

Time in Oven, hr.	Woven Tire Fabric	Two-Ply Balloon Fabric
2	186.6	75.5
3	187.6	72.8
4	182.2	72.8
5	185.8	69.5
6	185.6	74.8
7	190.2	72.5
8	188.2	73.8
9	184.4	72.5
10	181.8	...
11	190.4	...
12	187.0	...
13	186.0	...
14	185.0	...

2—The average tensile strength of conditioned samples of woven tire fabric was 287.4 lb. as compared with 289.4 lb. for dried and reconditioned samples.

3—The average tensile strength of samples of Courtrai wing linen after conditioning 3 hr. was 99 lb. while the average tensile strength of samples dried 3 hr. in the oven was 67.3 lb.; samples dried 3 hr. and then reconditioned for 3 1/2 hr. showed average tensile strength of 99 lb. with a moisture

Fig. 3

Fig. 4

Fig. 5

regain of 7.94 per cent or 6 per cent increase in strength for each per cent of moisture absorption.

4—Dried and reconditioned samples of balloon fabric showed an average tensile strength of 101 lb. against 105.6 lb. for conditioned samples.

5—The effects of joints in balloon fabrics on tensile strength are as shown in Table III.

TABLE 3—TESTS OF JOINTS IN BALLOON FABRIC  
Average Strength, lb.

How Tested	Light	Medium	Heavy
With joint	90.8	100.4	103.6
Without joint	94.8	97.0	103.8

#### Methods

The humidity in the testing room was run up to a high figure. For most of the tests the temperature was 75 deg. Fahr. and the relative humidity 80 per cent. The samples of a given fabric were hung all at one time to the number of about 150 in the room and allowed to regain moisture for not less than 4 hr. They were then taken in groups of four or five and held in a hot oven for periods varying from 3 sec. to 20 min.

This operation graded the actual regain from a high figure practically to bone dryness. After removal from the oven the samples were placed between the leaves of a heavy book to keep the moisture as near stationary as possible until they were tested. They were broken in rapid succession, removed speedily from the machine and immediately inclosed in airtight glass weighing bottles. The interval between breakage and sealing in the bottles was not over 4 sec. Five samples of the linen and cotton were grouped as one test and weighed after breakage together. It was assumed that their humidities were all the same. For the balloon fabric four samples were grouped. Immediately after breakage the bottles and contents were weighed and the net weight of the fabric found by subtraction. The fabric was next taken from the weighing bottles and dried for not less than 2 hr. in the oven. The fabric was transferred from the oven baskets back to the weighing bottles inside the oven door by means of tweezers. No specimens were touched by the hands except a few of the balloon fabric. After cooling, the bottles were again weighed and the bone dry weight of the contents found by subtraction. From this the regains at the actual time of the tests were calculated in terms of the dry weight. It is believed that this method is as accurate as can be found for determining the moisture actually present at the time of breakage. For higher degrees of regain the samples were hung from 10 min. to 2 hr. in the wet room previously described where the relative humidity was about 95 per cent.

In the case of the woven tire fabric only one sample at a time was tested. This was first dried, then exposed to moisture in the wet room and lastly tested as above.

The results of the tests upon cotton wing, linen wing, balloon and woven tire fabrics are shown in Figs. 1, 2, 3 and 4, respectively. Their interpretation is evident. The several tests at a given humidity are denoted and their average is signified by the crossed circle.

It was found that it was very difficult in this thin fabric to test the samples, nominally "bone-dry," without a considerable

reabsorption of moisture. About 1.5 per cent regain occurred during the interval between removal from the oven and breakage. "Full regain" in an atmosphere slightly above standard was denoted by about 8 per cent absorption. Beyond this the absorption was obtained by exposure in the wet room at 95 per cent relative humidity. The average increase in strength from the dryest obtainable to 8 per cent regain was from 58 to 72 lb., or 14 lb., about 24 per cent of the bone-dry strength. This corresponds to about 3 per cent increase in strength for each added per cent of moisture. Twenty-four sets of tests made by the classes in airplane study at the institute upon this same kind of fabric showed an average increase of 26 per cent between bone dryness and full regain. The curvature of the plot does not take place within the region of usual regain and the line may be considered straight for all practical purposes. One hundred and thirty-three samples were broken in this fabric and only two were cast out as indicating "flaw breaks."

#### Wing Linen

The normal regain of raw flax fiber is often stated as 12.5 per cent of the dry weight. While this is doubtless true for a free condition of the material, the figures are much less for manufactured linen. Flax absorbs moisture much more quickly than cotton. Bone-dry samples tested, with great dispatch regained nearly 2 per cent of moisture before breakage. The normal regain for the fabric was about 9 per cent and the strength increase from about 55 lb. to 85 lb., or 30 lb. This represents about 54 per cent of the bone dry strength, a gain of 6 per cent in strength for each added per cent of moisture. Twenty-two sets of tests made by classes in aviation showed 40 per cent increase in strength. The degree of moisture regain in these tests was not so high as those performed by the author. One hundred and twenty-three tests were made on linen and five omitted in the plot. A few were made at yet higher degrees of moisture and indicated but little increase in strength, hence the line should bend down to the horizontal as it leaves the plot.

#### Balloon Fabric

The effect of moisture on rubberized fabrics is unique. The moisture is very much slower naturally in entering such material. Bone-dry tests can be conducted with an actual moisture reabsorption of less than 0.5 per cent before breakage. At low regains the moisture probably lies upon the outer surface and has but little effect upon the strength. At higher regains the moisture evidently penetrates the fiber and has a pronounced effect. From bone dryness to a full regain of 7½ per cent there is an increase of from 70 to 110 lb., or 40 lb. This corresponds to about 57 per cent of the dry strength, or nearly 8 per cent increase for each added per cent of moisture. The increase is not uniform, however, as the curve indicates. One hundred and thirty-nine breaks were made and none omitted on the plot.

#### Woven Tire Fabric

The term "standard regain" has generally been applied to the percentage of moisture automatically absorbed by raw cotton when exposed for a more or less lengthy period in an atmosphere at a temperature of 70 deg. Fahr., and a humidity 65 per cent of saturation. This quality has generally been stated as 8.5 per cent of the dry weight. While the above regain value is doubtless true for raw cotton exposed for long periods to high degrees of moisture, it is believed that for heavy grades of manufactured cotton, where free access to the air is less perfect and especially where the regain is artificially produced by exposure of but a few hours in a "conditioning room," the value seldom exceeds 6.5 per cent of the dry weight. It is therefore proposed from practical considerations, to define the "standard condition" of tire fabric as that at which a moisture regain of 6.5 per cent of the dry weight has been attained. Fig. 4 was the work of Messrs. Yeaton and Panettiere, performed under the author's direction in the Textile Laboratory at the Massachusetts Institute of Technology, and comprised accurate strength and regain determinations with the latter varying from zero to 9

# Recovery of Gasoline from Natural Gas

Machines Used in Plants of Standard Design—Industry About Fifteen Years Old and Growing Rapidly

IN investigating the general problems that relate to the petroleum industry of the United States, the Bureau of Mines has given considerable attention to the recovery of motive fuel from natural gas. Recent developments in gasoline power units and their increasing use have made it imperative that all fractions of petroleum, suitable for fuel in this type of engine, be conserved. The Bureau has issued a number of publications on this subject, the latest being Bulletin 151, on The Recovery of Gasoline from Natural Gas by Compression and Refrigeration, by W. P. Dykema. It treats of the compression and refrigeration process for the recovery of gasoline from natural gas from the viewpoint of the practical engineer and business man. Conditions of actual operation and the equipment in use are cited and described, so that operators and others interested can compare the variations and methods of treating natural gas for its gasoline contents, in the different fields, and also the conditions encountered, and the features that control the methods used.

The bulletin deals with the subject quite extensively, in more than a hundred pages of text and illustrations. It may be of interest here to reproduce the conclusions reached by the author.

## Raw Materials Affect Methods Used

The various hydrocarbons, and also the impurities, found in natural gas as it comes from oil or gas wells, have a direct bearing on the plant practice and treatment that will yield the most condensate. The more complete and thorough the tests made on the gas to determine its composition and physical characteristics are, the less chance there will be of those interested building and operating a compression plant that is not best suited for treatment of that particular gas.

Thus far the plants installed have been generally of standard design and equipment using the maximum safe pressures for which standard machines and fittings were built and temperatures obtainable by simple methods of water cooling, little consideration being given to the qualities of the gas to be treated.

Gas testing as followed at the present time is done only to determine if the gas can be profitably treated, and, if found so, a plant of general standard design is put in operation. It must be admitted that these plants as a whole, throughout the United States, have proved financially successful, but as a rule such success is due, in the writer's opinion, more to the fact that only the rich gas has been taken for treatment than to careful plant design and operation. The great increase in production at a few of the plants where the operators have studied the gas being treated and installed equipment best suited to its composition and characteristics indicates that gross waste is taking place at many plants of standard design. As more is learned of the best methods of treating natural gas in compression plants, gas of lower gasoline content can be and will be used in such plants.

## Treatment Should Change with Aging of Wells

At many plants visited no gas tests of any kind had been made since the original tests to determine whether the gas was rich enough in gasoline to warrant treatment. With the aging of the wells, the extension of gathering lines, and the installation of vacuum pumps, which often draw air into the gas lines, it is hard to believe that no variation in treatment was necessary if the best results were desired. Gravity tests of the gas used should be made from time to time at all plants. The results will indicate any changes in composition and usually whether air has been taken into the line. This

test, if made at different points in the treatment and on the treated gas may also indicate either a change in the character of the gas or that some part of the plant is not working as usual. Other tests, such as absorption and compression tests and analyses, made and recorded at regular intervals, have been of value in determining sources of trouble and indicating the need of experiments and of plant changes.

Experimenting with the entire plant or one complete unit by changing the temperatures and pressures and recording the results may lead to better recovery or a better product.

## Pressures and Temperatures

Gas from wells that are being and often have been gas-pumped for years, and are held under high vacuums is composed largely of the heavier vapors that would, unless vacuums were used, remain as liquid in the oil, and in treating such gas extreme pressures and temperatures are not necessary.

In eastern fields, where these conditions are most often found, single-stage plants working at a pressure of about 100 pounds and using such temperatures as can be obtained in submerged coils cooled by the natural temperatures of well or creek waters, give satisfactory recoveries and produce condensates with a gravity and vapor pressure as high as can be handled, either blended or unblended. In the same fields, however, plants treating gas from old wells not held under vacuum have found that not enough of the vapor carried by the gas can be condensed at pressures lower than 300 pounds to be profitable. The condensate produced at that pressure was exceedingly wild and in order to effect a maximum saving required blending as early in the process of precipitation as possible. It appears from the above facts that gas taken from wells held under high vacuum carries portions of the higher-boiling fractions, distilled from the oil under reduced pressures, that would otherwise have remained in the oil in the sands. The removal of the lighter fractions by this method has less effect on the gravity of the refined oil than would at first seem probable, because a marked percentage of these vapors undoubtedly came from oil left in the sands which in all probability will never be extracted, and also because the oil production from many small wells held under high vacuums is stored for days, and even weeks, in tanks, exposed to changes in atmospheric temperature, during which time the lighter fractions are lost to a greater or less extent. Under these conditions, relieving the oil of its lightest vapors before it is exposed to evaporation, or while still in the sands underground, would save these valuable products.

## Practice in Newer Fields

In the newer fields, in which the gas is still produced under widely varying rock pressures, a maximum plant pressure of 250 pounds is almost universally used, and refrigeration has often been found to increase production 10 to 50 per cent.

Besides the usual cooling with water, at some plants the gas is also cooled in heat interchangers, while still at the maximum pressures used, with expanded gas. The dry compressed gas is expanded adiabatically in the power cylinder of a steam engine, its temperature being lowered at times to  $-100^{\circ}$  F. In the heat interchanger the high-pressure gas is reduced to temperatures as low as  $-10^{\circ}$  F., which causes vapors not condensed in the water-cooled system to precipitate. It is the writer's opinion that many plant operators are overlooking gas expansion as a means of increasing the net production of their plants.

The treatment of natural gas for gasoline is unlike those

manufacturing processes in which the treated material may be stored and treated a second or third time after the first extraction or concentration of the desired portions, because the gas, after once coming to the surface, must be kept moving until treated and used as fuel or wasted to the atmosphere. Thus marketable fractions of condensate left in the gas after treatment are practically entirely wasted.

#### Condensate

The gasoline carried in natural gas and precipitated at different points in the treatment consists mostly of pentane and hexane, the fifth and the sixth members of the paraffin series, smaller proportions of heptane, the seventh member, and decreasing percentages, if any, of propane and butane, the third and fourth fractions. In condensates produced at high pressures and low temperatures, probably some propane and butane are present and with dissolved gas cause the high vapor tensions of some plant products. The amount of dissolved gas is probably of no importance, as far as volume is concerned, but there seems to be little reason to doubt that when the pressure on the condensate is relieved the gas has a decided tendency to cause boiling and agitation of the liquid, which, with boiling of the propane or the butane, causes losses not only of these constituents but also of some of the heavier members during weathering.

The gravity of the plant products as they come to the accumulator or the "make tanks" varies between 70° and 96° B., and the vapor tension, from 5 to 40 pounds.

The gravity and the vapor tension of the condensates as collected in the accumulator tanks of the successive stages become higher as the higher pressure and the lower temperature changes are reached. The products range from line drip or distillate with a gravity of 55° B., produced at atmospheric temperature and pressure, to condensate with a gravity of 105° B., produced in the accumulator tank at the expansion-engine exhaust, at -40° F., the gas having been reduced to a pressure of 10 pounds.

Experiments and the equipment of recent plants indicate that to remove the condensate from contact with the gas as soon as possible after precipitation and collection is the best practice. This is accomplished by the use of small automatic traps, which drain the liquid from the accumulator tanks as soon as collected. The liquid then passes through pipes to "make tanks," or storage tanks, the pressure being reduced on a small quantity of condensate at each dumping of the trap with the least possible agitation and consequent boiling. This method reduces transfer losses and those from sudden lowering of pressure on large amounts of condensate at one time. The automatic traps are used in transferring either raw or blended products from accumulator tanks to storage or "make" tanks at lower pressures.

#### Blending

Although some casing-head gasoline is shipped and used without being blended, most of it is mixed or blended with naphtha of lower gravity and vapor tension before reaching the consumer.

Condensate, although at times shipped unblended, is in the most modern plants and the latest practice blended as soon as possible after being formed, or even while in the process of precipitation. Some operators still ship their product partly blended or reduced in gravity and vapor tension to blending stations or refineries, but the general practice is to blend at some stage of precipitation or storage at the plant.

Blending at the plants is done in the storage tanks, the "make tanks," and the accumulator tanks, and at times in the coils while the condensate is still in process of precipitation and in contact with the high-pressure gas. Operators using these methods claim definite increases in production for each successively earlier point in the process of cooling and precipitation in the high-pressure units at which blending is accomplished.

Naphthas having an end point of approximately 400° F. are in general use as blending stocks, but at some plants where regular supplies of this stock could not be obtained, distillates having the end points and gravities of kerosene are used.

Some blending companies use with the usual naphthas small quantities of "straight" still-run California gasoline,

specific gravity 58° B., and Mid-Continent and eastern grades, specific gravity 66° to 68° B., in order to increase the proportions of those hydrocarbons of which the naphtha and the condensate contain only small percentages.

#### The Advancement of the Industry

Since the first commercial gas compression plants were established, about 15 years ago, in the eastern oil fields, marked advancement has been made in the mechanical and commercial phases of the natural gas-gasoline industry.

Up to about five or six years ago most of the plants consisted of the simplest forms of gas pumps, single-stage compressors, and cooling coils, were operated only on rich casing-head gas that would produce 4 to 6 gallons of condensate, and had a capacity of not more than 200,000 or 300,000 cubic feet daily.

At present plants are in operation treating 6,000,000 to 9,000,000 cubic feet daily of gas yielding as low as 1 gallon of condensate per 1000 cubic feet, using pressures of 250 and 300 pounds per square inch in two stages of compression, with elaborate systems of cooling the gas with water before compression and after each stage of compression. The water used is cooled below normal temperatures by induced aeration and radiation.

In some plants the gas is further cooled by expanding the dry treated gas through the cylinders of an expansion engine and using the cold expanded gas to cool the high-pressure gas from the water-cooled coils. Temperatures as low as 0° F. are often obtained, causing the precipitation of nearly all the condensable fractions commercially valuable for making gasoline.

### Definition of Hardness

IN France a method of testing hardness has been in use for sixty years or more which consists in dropping from a given height onto the material to be tested a small hammer or "monkey" with a pyramidal or conical point which causes an indentation of the material. Originally the reciprocal of the width of the indentation was taken as a measure of the hardness. In 1895 Lt.-Col. Martel in a paper presented to the Paris Congress on Testing Materials showed conclusively that the work expended in making the indentation is proportional to the volume of the indentation, irrespective of the form of the hammer point. If  $V$  is the volume of the indentation,  $P$  the weight of the monkey and  $F$  the height of fall, then  $D = PF/V$  is the Martel hardness number. It has now been shown by W. C. Unwin in an article in *Engineering* that the Martel hardness numbers are identical with the Brinell hardness numbers. In the Brinell test the standard ball is 10 mm. in diameter and the load 3000 kg. If  $P$  is the load and  $A$  the area of the spherical surface of the indentation then Brinell's hardness number is  $H = P/A$  in kilogram-millimeter units.

Unwin states that the reason for dividing  $P$  by the surface of the spherical calotte is not obvious, and it is not known that Brinell has given an explanation. He then proceeds to show mathematically that the Brinell number is identical with the Martel number and that hardness of a ductile material may be defined as (a) the work required to indent unit volume or (b) the ratio of a steady load to the spherical surface of a ball indentation.

MOTOR tractors are now being used to expedite farm work on a rubber plantation of some 20,000 acres in Sumatra, which is controlled by one of the largest tire manufacturing companies in the United States, says the *Commercial Motor*. Before the tractor was put into service it required 250 coolies to plough three acres a day; the tractor at present in use is cultivating 20 acres of land in the same time.

IN the key to the illustration which accompanied our recent article on the Gasograph, there occurred a number of errors. Fig. 2 indicated the compensating thermostatic arm, instead of the movement (though this arm is a part of the movement); Fig. 5 represented the gasoline level and not a pressure piston. We believe that with these corrections the operation of the device will be perfectly plain from the description.

# Larger Engine in Happy Farmer Tractor

*Side view of the Happy Farmer tractor*

**New Model Superseding Others Also Has New Oiling System and Longer Frame—Turning Radius Has Been Shortened**

**A**LL of the principal features of its previous models have been retained in the new model F Happy Farmer Tractor which has been brought out by the La Crosse Tractor Co. of La Crosse, Wis. The three-wheel construction, light weight, short turning radius and low center of gravity which characterized its forerunners are also found in the new model.

The changes which have been made include an increase in the bore of the cylinders to 6 in. and a lengthening of the pipe member of the frame which increases the length over all to 153 in. and gives a better balance to the tractor. To facilitate starting, a gasoline primer has been installed and the change from gasoline to kerosene is accomplished by means of a device which is practically automatic in operation.

Another new feature is an improved oiling system in which the lubricating oil is used three times and which makes it unnecessary ever to drain the crankcase. There has also been added a new centrifugal air cleaner of unusual design.

An engine of the twin horizontal, valve-in-head type of the company's own design is employed. It has a bore of 6 in. and a stroke of 7 in. The cylinders are cast in block. The engine has a normal speed of 750 r.p.m.

As will be seen from the drawings and photographs herewith the valves which are 2½ in. in diameter are operated by means of rocker arms of exceptionally substantial design which are actuated by long horizontal push rods extending from the camshaft inclosure which is located in the upper portion of the crankcase.

The short intake manifold is surrounded by the exhaust as a means of providing the necessary heat for the thorough vaporization of kerosene when that fuel is being used which is, of course, the major portion of the time, as gasoline is used only for starting purposes. The carburetor is a 1½-in. Kingston. The timing of the intake valve is such that a considerable vacuum is created in the combustion chamber before the valve is opened. This has the effect of causing

the vaporized kerosene to rush into the combustion chamber at high speed, and this reduces materially the time during which condensation can take place. The temperature of the mixture as it enters the combustion chamber is said to be from 40 to 50 deg. higher than that of the atmosphere.

The design of the removable cylinder heads provides for an ample jacketing about the valves. The combustion space is cylindrical in shape. The pistons are of the square type with four rings at the top and the piston pins are located centrally along their length. The latter turn in the pistons and are secured in the small end of the connecting-rods by means of clamping cap screws which fit within slots cut in the pins.

The crankshaft is drop forged, 2½ in. in diameter and has two main bearings 5½ in. long. The connecting-rods are 2½ in. by 3½ in. at the point of largest section and are 13 in. long between centers. The bearings are die cast with babbitt backed with bronze bushings.

A system of forced-feed lubrication is used employing a Madison-Kip five-lead oiler, which is driven by a belt. An original feature of the lubricating system is the use of a pressed steel oil ring centered on the crankshaft midway between the two bearings. This ring resembles two eccentric concave disks joined together. It is fitted with a double

*Vertical section through the La Crosse engine, showing position of carburetor*

*La Crosse engine with front of crankcase removed, left, showing crankshaft and crankshaft bearings. M—Disk for patent oiling device. At the right is the front of the engine, showing the arrangement of the valves. N is the pipe for gasoline jet for starting*

flange at its periphery. As the oil is fed to this ring in a jet from the Madison-Kip oiler the eccentricity of the disks throws it from one side to the other. It is caught at the periphery and is fed by centrifugal force to the center of the main crankshaft bearings through holes drilled in the crankshaft.

As the oil runs from the main bearings it is caught in a sump at the bottom of the crankcase. Provision is made in the form of baffle plates to prevent any kerosene which may have worked by the piston rings from getting into this oil which is drained to the gear cases and from there conveyed mechanically to the final roller driving pinions. In this way the oil is used three times and at no time can it be mixed with kerosene. It can also be seen that this system makes it unnecessary ever to drain the oil out of the crankcase, as that matter is taken care of automatically.

*End view of La Crosse engine, showing valve rockers and ignition equipment*

The cooling system comprises a Spirex Modine radiator, fan and circulating pump. The radiator is mounted lengthwise at the front. The construction of the cylinders is such that there is a circulation of water between them and around the valves in the head. The cooling system has a capacity of 9 gal. The fan runs at a speed of 2100 r.p.m. A belt tightener is provided to insure that this speed is always maintained.

A contracting band clutch of the company's design is used. The gearset is of the sliding type and runs on Hyatt bearings in oil. In the differential the ring gear is not integral with the spider but is bolted on and is made of semi-steel. As is shown in one of the photographs, a differential brake is provided to assist in making short turns. In the drawings of the differential the method of lubrication for both the differential and the final roller drive pinions is shown. In the front sectional elevation view the pipe through which the oil runs from the motor crankcase is shown as are also the pipes which conduct the oil on the final stage of its journey from the troughs at the top of the differential case to the roller pinions.

The open bull pinions on the ends of the jackshaft are fitted with  $\frac{3}{4}$ -in. heat-treated steel rollers and mesh with the internal bull gears on the driving wheels to provide the final drive. A gear ratio of 42 to 1 is used. The bull gear is made of cast semi-steel in four segments which are interchangeable. They are attached to the wheels by  $\frac{1}{2}$ -in. bolts which are made a driving fit in order to prevent their working loose.

The bull gears are not inclosed but the pinions are provided with mud guards for protection and adequate lubrication is provided in the manner previously described.

The front portion of the frame is made up of a large diameter pipe supporting a cast bracket which carries the steering wheel yoke. A worm engages with a worm wheel secured to the steering wheel yoke and through this combination by means of a hand wheel the tractor is steered. The right drive wheel and the steering wheel run in the furrow when plowing, and steering is therefore said to be practically automatic.

One of the special features of the Happy Farmer Tractor is the centrifugal air cleaner used. It is a cylindrical dipper shape mounted against the front of the radiator with its large open end opposite the hub of the fan and held there by means of a spiral spring. The theory of operation is that the centrifugal action set up by the fan will throw dirt and dust away from its center leaving clean air to be drawn in through the cleaner and its connecting pipe to the carburetor.

The weight of the tractor is 3800 lb., 88 per cent of the weight being distributed on the drive wheels and 12 per cent

Gearset and clutch, showing attachment of power pulley

on the front steering wheel. It is rated at 12-24 hp. and is said to have a pull of 2000 lb. at a normal speed of 2½ m.p.h. The turning radius is 8½ ft. and by means of the differential brake referred to the tractor can be turned about practically pivoting on either driving wheel. The draw bar is of the swinging type, attached midway between the drive-wheels 16 in. from the ground, has a lateral adjustment of 30 in. and a vertical adjustment of 3 in. The tractor sells for \$1,075 f.o.b. La Crosse. The production for the current year is to be about 4000.

Right—The new Happy Farmer patent oiling system

## How Moisture Affects the Strength of Aircraft Fabrics

(Continued from page 102)

per cent. Seventy-five warp specimens were broken and none have been cast out.

The actual increase in tensile strength with moisture regain between bone dry and 8.5 per cent is indicated by the curved line *a b*. This is not a very abrupt curve, but approximates somewhat the straight dotted line *a b*. For the dotted line *a b* the rate of increase in tensile strength is 7 per cent for each added per cent of moisture for the fabric. This has led some testing laboratories to adopt a method of correction for moisture regain. The samples are weighed in their natural condition and broken in rapid succession before the moisture present can change. The broken specimens are then weighed again after drying in an oven. This gives a means of computing the regain which was present at the actual time of testing. To reduce the tensile strength to a condition of complete moisture regain, namely 8.5 per cent, it would be necessary first to divide the apparent strength by  $100 + (7 \times \text{actual regain percentage at test})$ , and then multiply by  $100 + (7 \times 8.5)$ . This is equivalent to reducing the strength of the sample to a bone-dry condition, on the assumption of 7 per cent strength increase for each per cent of regain, and then moving it up again on the same basis to a full regain of 8.5 per cent. Thus, if a piece of tire fabric gives an apparent tensile strength of 260 lb. and was found to contain 4 per cent regain at the time, its strength corrected for full regain would be,

$$\text{Corrected Tensile Strength} = \frac{260 \times [100 (7 \times 8.5)]}{100 + (7 \times 4)} = 324 \text{ lb.}$$

If tire fabric could be made to move readily from the bone-dry condition to full regain, the above method would suffice and give results very approximately correct. However, as a

matter of practical fact, manufactured cotton in its natural state rarely contains less than 3 nor more than 6.5 per cent regain. It has been deemed wise by the committee, therefore, to set up these arbitrary limits in order most nearly to meet working conditions. The full regain or "standard conditions" has therefore been set at 6.5 per cent in the proposed tentative standards of Committee D-18.

Between the above limits of 3 and 6.5 per cent regain the strength curve is more nearly approximated by the straight line *d e*, for which the rate of increase is very nearly 6 per cent of strength for each per cent of regain. For actual working conditions, therefore, the form of the correction equation should be,

$$\begin{aligned} \text{Corrected Tensile Strength} = \\ \frac{\text{Apparent strength} \times [100 (6 \times 6.5)]}{100 + (6 \times \text{Actual Regain at Test})} \end{aligned}$$

It is to be borne in mind that this formula is only applicable between regains of 3 and 6.5 per cent. It will not yield the bone dry strength at *c* on the assumption of zero regain, nor will it give full regain strength on the basis of 8.5 per cent regain.

The mathematics of Fig. 4 are as follows: In passing from bone dry to 8.5 per cent regain the increase in strength is from 170 lb. to 274 lb., or 104 lb. This represents 61 per cent of the dry strength or about 7 per cent increase in strength for each added per cent of regain. Between bone dryness and 6.5 per cent regain the strength increases by line *c d e* from a fictitious bone-dry strength of 190 lb. to 265 lb., or 74 lb. This represents 39 per cent of the imaginary dry strength of 190 lb. Thus within this range of 6.5 per cent regain there is an increase of 6 per cent in strength for each added per cent of moisture.

Fig. 5 shows the effect of correcting all the tests of Fig. 4 by means of the above formula. The straight line is the numerical average of all the tests so corrected.

# Predicting Strength and Efficiency of Airplane Propellers

Charts and Formulae for Calculating Horsepower Absorbed and Torque Delivered at Given Engine and Plane Speeds

By F. W. Caldwell\*

UNDER war conditions, when there is lack of time for extensive propeller trials and experimental work, we must be able to predict the performance of a propeller as to the horsepower absorbed at given airplane and engine speeds and as to its efficiency under these conditions. It is also necessary to make stress calculations for the purpose of predicting strength, since there is usually no opportunity for a destructive test before the propeller has to be put into production. The main purpose of this paper is to show how such calculations are made.

The first step is to choose a diameter. The chart, Fig. 1, shows the minimum diameter required to maintain the slip as low as 15 per cent. The chart also shows the maximum propeller speed that can be used for any given diameter and

\*Aeronautical mechanical engineer, Aviation Section, Signal Corps, U. S. Army.

Fig. 1—Chart for determining propeller diameter for 15 per cent slip, and also maximum propeller speeds for given diameters and horsepower

Fig. 1A—Propeller efficiency at various speeds of flight

Fig. 1B—Values of factor f for various effective propeller pitch angles

Fig. 2—Experimental blade form

horsepower. If the speed is greater than that shown as the maximum, a smaller diameter must be chosen for the propeller, and there is a consequent loss in efficiency.

The diameters given are minimum diameters for good practice. In general the diameter should be made as large as possible without making the blades so narrow that they will flutter excessively when wood construction is used. Plane designers should bear in mind the necessity of ample propeller diameter in laying out a power plant installation; an otherwise excellent design may be spoiled by limitations of clearance, resulting in too small a propeller diameter.

After determining the diameter, a blade form must be chosen. The question of the outline of the blade form is an unsettled one, since different blade forms are based on elaborate theories. The difference in efficiency of different blade forms is not great, but the difference in strength is considerable. The form shown in Fig. 2 is a fair one, both as to efficiency and strength.

The following nomenclature relating to propeller design will be used in this paper:

Fig. 3

$\rho$  = specific weight of air expressed in pounds per cubic foot.

$g$  = acceleration due to gravity = 32.2 f.p.s.

$K_L$  = lift coefficient, absolute units.

$K_D$  = drag (or lift) coefficient, absolute units.

$L$  = vertical component of force (lift) on aerofoil, pounds.

$D$  = horizontal component of force (drag) on aerofoil, pounds.

$f$  = factor for computing work absorbed by propeller.

$C$  = empirical constant depending on blade form.

$S$  = area of plane surface, square feet.

$V$  = velocity of airplane, feet per second.

$P_e$  = effective pitch of propeller or advance per turn.

$V_1$  = velocity (in helical path) of propeller element, feet per second.

$v$  = velocity of slip stream, feet per second.

$b$  = maximum blade width, feet.

$b_1$  = effective blade width, feet =  $0.75b$  for blade form in Fig. 2.

$N$  = engine speed at ground level, rev. per second.

$N_r$  = engine speed at 20,000 ft. altitude, rev. per second.

$D$  = diameter of propeller, feet.

$D_1$  = equivalent diameter of propeller, feet =  $0.580D$  (for computing work absorbed only).

$R$  = radius of propeller, feet.

$T$  = thrust, pounds.

$A$  = area of propeller disk, square feet.

$A_1$  = effective area of propeller disk, square feet

$$\left( = 0.95\pi \frac{D^2}{4} \right) \text{ (as corrected for the 5 per cent area considered ineffective due to the radiator).}$$

$$\phi = \tan^{-1} \frac{V}{\pi ND} \text{ (effective pitch angle).}$$

$$\beta = \tan^{-1} \frac{K_D}{K_L}$$

$\theta$  = blade angle, degrees.

$e_1$  = theoretical efficiency (Froude Method), per cent

$$\left( = \frac{100V}{V + v/2} \right)$$

$e_2$  = aerofoil efficiency, per cent.

$e$  = true efficiency, per cent ( $= e_1 \times e_2$ ).

It is necessary to solve for blade width and angle of attack by means of an empirical formula. As a rough rule the angle of attack may be taken as 2 deg. for plane speeds above 100 m.p.h. and 3 deg. for plane speeds below 100 m.p.h. The method of checking this would go beyond the scope of this paper, which is intended to cover only fundamentals.

The maximum blade width should be about one-twelfth the diameter for the best practice. This gives an "aspect ratio" of six for each blade.

The usual method of computing blade widths consists in dividing the blade into zones and treating each zone as a separate aerofoil. The power absorbed by each zone is then found from the formula

$$\text{Work for zone} = \frac{\rho}{g} K_L S V_1^3. \quad (2)$$

This may be simplified by taking an average value of  $K_L$

Figs. 4, 5 and 6—Deflections caused by axial thrust and centrifugal force, as well as cross-sectional view of blade

Fig. 7—Characteristics of typical aerofoils from the 1912 report of the National Physical Laboratory, England

for the blade and a weighted mean for the blade width. The power absorbed per blade is then found from the formula:

$$\text{Power} = \frac{\rho}{g} K_D b_1 R V^3 f C \text{ ft.-lb. per sec.} \quad (3)$$

The value of  $f$  may be obtained by taking 0.58 of the diameter to represent an equivalent diameter for the whole blade. (This value has been established experimentally for blade form shown in Fig. 2.) Then the value of  $V/0.58\pi ND$  is calculated, as is the corresponding angle whose tangent is  $v/0.58\pi ND$ , and the corresponding value of  $f$  is found on the chart, Fig. 3.

The ordinate corresponding to the angle is followed until it crosses the line corresponding to an  $L/D$  of the section, and the corresponding value of  $f$  is read on the scale at the right or left. An average value of  $L/D$  may be assumed with sufficient precision to be twenty, when using this method.

The empirical constant  $C$  is dependent on the blade form and must be determined experimentally. For the blade form shown in Fig. 2 it is 1.1, while it varies from 0.85 to 1.2 for different blade forms now in use. The symbol  $b_1$  represents the weighted mean of the blade width. This weighted mean of the blade width is found by determining the mean ordinate of a curve in which the cubes of the radii of the blade sections are laid off as abscissa and the corresponding blade widths are laid off as ordinates. This empirical method gives good results.

The best method of computing propeller efficiency consists in an extension of the water-propeller theories. The theoretical efficiency  $V/(V + v/2)$  is computed. First the thrust is computed and then the slip-stream velocity from the

$$\text{impact formula } T = \frac{\sigma}{g} A V v.$$

To compute the aerofoil efficiency a representative point along the blade is taken. This will usually be at 75 or 80 per cent of the radius according to the blade shape; for the blade shown in Fig. 2 it is at about 78 per cent. The product of the theoretical and aerofoil efficiencies gives the actual efficiency very closely. There is a further small correction due to the spiral component of the slip stream.

The angle whose tangent is  $V/0.78\pi ND$  is found and a corresponding ordinate  $\phi$ , Fig. 3, is followed until it crosses the efficiency line corresponding to the  $L/D$  of the aerofoil section at 0.78 of the radius. This  $L/D$  will be about twenty in good design.

Wood has been the favorite propeller material up to the

Fig. 8

present. Its success is mainly due to its high tensile strength, light weight and flexibility. Flexibility is an important factor in reducing propeller stresses, as can be seen from Figs. 4 to 6. When the thrust is applied to a wooden propeller, the blade bends and the centrifugal force creates a moment tending to restore it to its original position.

The lack of flexibility is evidently one of the weaknesses of steel propellers, since the metal cannot bend and accommodate itself to the different flying attitudes. This difficulty can be overcome for any single flying attitude and air density by offsetting centers of gravity of different sections in such a way that the bending moment due to air pressure is compensated for by the bending moment due to centrifugal force.

Among the propeller materials experimented with up to date the metals have shown the least encouraging results. While I do not consider a steel propeller out of the question, it is certain that the results to date have been discouraging. Steel propellers should be given a thorough ground test before being used in flight on an airplane, since the failures are usually extremely sudden and are disastrous to the plane structure.

#### Aerofoils

The aerofoil sections used have an important bearing on the propeller efficiency. The characteristics shown in Figs. 7-9 are taken from a report issued in 1912 by the National Physical Laboratory of England, and are about as good as any that have been published.

#### Adjustable-Pitch Propellers

Almost from the start of air-propeller work, a propeller with adjustable pitch has been considered highly desirable, because it is believed that the efficiency of the propeller could then be maintained constant for different airplane speeds. This is based on the theory that the  $L/D$  of the aerofoil section is the controlling factor in the propeller efficiency, a theory which is not borne out in practice.

Fig. 10 illustrates the effect of varying plane speed on the apparent angle of attack of a propeller section. This angle is usually chosen as 2 deg. for a flight speed of 130 m.p.h. and the aerofoil will then have a ratio of  $K_y/K_x$  of about twenty. In climbing at the rate of 70 m.p.h. the apparent angle of attack will be increased to about 10 deg., and the  $K_y/K_x$  ratio will drop to from ten to twelve.

Fig. 11 shows that the increase in true angle of attack is not so great when the slip stream velocity is taken into account; besides this, the theoretical efficiency  $(V/V + v/2)$  is

FIG. 9—DIMENSIONS OF TYPICAL AEROFOIL SECTIONS

$g = 0.875$	$o = 0.190$		7	0.437

greatly reduced in climbing and is not increased by an increase in the aerofoil efficiency.

An analysis of an adjustable pitch propeller (appended to this paper) shows no gain in efficiency. There is, however, a net gain in horsepower delivered to the plane, owing to the increase of engine speed in climbing. For the case in question the gain in the rate of climb is 49 per cent. Fig. 12 shows the gain in the rate of climb in a somewhat slower machine.

The keeping up of the engine speed becomes of interest in connection with the development of an engine with torque that is constant at high and low altitudes. From the performance curves shown in Fig. 14 it is apparent the climbing rate of a plane equipped with such an engine would be greatly improved if the engine speed near the ground were increased and kept the same as the plane climbs.

#### Constant Engine Power at Altitudes

It is the opinion of the author that, if it becomes desirable, an adjustable pitch propeller of fairly light weight can be built for a smooth running engine, such as the Liberty twelve, but considerable trouble may be expected with engines that have an inherent vibration.

The author has been told by many engine designers that it would be useless to build an engine to maintain its power at altitudes, because the propeller efficiency would then be so low that the net gain would be small.

All aeronautical engineers who have made a study of the subject realize that the development of an engine with constant, or nearly constant torque at altitudes up to 20,000 or 30,000 ft., is the one outstanding opportunity for improvement in airplane performance. It is just as easy to design propellers for operation at 20,000 ft. as it is to design them for performance at the ground level, so that the problem is one that must be solved by the engine designers.

The air density at 20,000 ft. is of the order of 50 per cent of that at ground level. The density of air is about 0.13 per cent of the density of water. Yet we are using the same means of propulsion in airplanes as is used in boats, and we are obtaining in practice efficiencies as high as 85 per cent, something which cannot be approached in marine practice. Not only is this true, but a propeller designed for use at 20,000 ft. will function without appreciable loss of efficiency near the ground, as may be seen from an analysis in which airplane and propeller performance are worked out in a typical case.

The words "constant torque" as used in the following analysis mean that the torque is independent of both the engine speed and the altitude. This is the simplest case to discuss, and the discussion applies exactly to this case alone. An engine that satisfies this requirement only in part would,

of course, have a performance intermediate between that of the conventional gasoline engine and that of the engine with constant torque. This analysis is applicable equally to a steam turbine and is perhaps of more interest in relation to a steam turbine, owing to the range of speed involved.

In comparing the performance of the airplane and propeller at 20,000 ft. altitude and at the ground, we will assume:

1. Speed of airplane at ground level, 130 f.p.h., or 191 f.p.s.
2. Output of engine, 356 hp. (at 1400 r.p.m., or 23.3 r.p.s.).
3. Diameter of propeller, 11.5 ft. (area 104 sq. ft.).
4. Total lifting surface of plane,  $S = 420$  sq. ft.
5. Total weight of loaded plane,  $W = 3400$  lb.

The value of  $K_v$  in absolute units is computed from the formula

$$W = \frac{\rho K_v S V^2}{g} \quad (4)$$

$$K_v = \frac{3400}{0.00238 \times 420 \times 191^2} = 0.0933. \quad (5)$$

The corresponding value of  $K_v/K_r$  may be taken as 12.3.

### HOMELESS AGE SUBSCRIBERS

Subscriptions for the Homeless Age transferred to the subscription list of AUTOMOTIVE INDUSTRIES in the merging of the two publications will be completed in full by the weekly issues of AUTOMOTIVE INDUSTRIES to the dates of expiration shown on the records of the Homeless Age Co.

Owned by United Publishers Corporation, Address 243 West 39th St., New York; H. M. Swetland, President; Charles G. Phillips, Vice-President; W. H. Taylor, Treasurer; A. C. Pearson, Secretary.

Entered as second-class matter Jan. 2, 1903, at the post-office at New York, New York under the Act of March 3, 1879.

Member of the Audit Bureau of Circulations.

Automotive Industries-The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

## War Work and Commercial Work

**M**ANUFACTURERS who have war contracts should exercise the greatest care to avoid even appearing to give too little attention to them and too much attention to their regular commercial work. Government work should and must come first.

Unfortunately there have been one or two instances in the passenger car industry where manufacturers, after having taken important war contracts, have laid themselves open to criticism by the Government because of a slowness in getting into production while at the same time their regular line was going through at its usual speed.

It is not for a moment thought that such delay is intentional or the result of a selfish indifference to the great needs of the hour, but its effect upon the industry as a whole is harmful to a degree that is not easily overcome.

When war orders and commercial orders clash,

preference must necessarily be given to the work which is helping to shorten the war. Government work is the most important work for any and all of us to-day, and those who have an opportunity to do it in any shape or form are fortunate indeed and should seize upon it as a chance to do something well worth while.

The only way that we can crush the Hun is by combined effort. Put the war work first, speed it up to the limit and then turn attention to things commercial and do the best possible with them without interfering with Government production.

## Let's Save Our Number Plate Steel

**I**T has just been announced that the 1919 number plates for the motor cars in New York State will be ready for delivery by the manufacturers to the State's automobile bureau beginning Aug. 1. It is estimated that half a million pairs of plates will be needed to meet requirements. Up to the first of this month there has been an increase in the number of cars registered of 44,130 passenger vehicles and 21,475 trucks over the corresponding period of 1917, and as the total registrations for last year in New York were 412,000 it seems that the estimate is by no means extravagant.

A pair of New York number plates weigh a little under 2 lb. This means that something like 500 tons of steel will be required to make the plates issued next year in New York alone.

The plates issued by the various states in the Union differ somewhat in size, but by taking the weight of the finished New York plate, which is about as large as any used, we can safely figure the total amount of steel needed for the number plates of all the cars in the country, and in doing so allow for waste.

Calculating on this basis we find that not far from 3500 tons of steel per year is used for the purpose of identifying motor cars—of providing the authorities, or others who would know, with a means of telling one automobile from another and who its owner is. Thirty-five hundred tons of steel is enough to build a good-sized ship.

Here is what seems to be an almost complete waste of good material which could be and should be stopped at once. Why is it necessary to change the number plates of all cars each year? The only answer that can be given is that changing the plates gives an opportunity to change their color or size or shape or the lettering on them and thus provides an easy means, an automatic means, of informing the police whether or not the annual registration fees have been paid. It sounds like a good reason, but is it?

They do not make us nail number plates on our houses and furnish us with a new one each year to show that we have paid our town, county and village taxes; they do not make us wear number plates and give us yellow, blue and green ones for different years to show that we have not overlooked sending

our checks to the Collector of Internal Revenue for that part of our incomes which we turn over to Uncle Sam.

Tax dodgers are not conspicuous because of any peculiar marks upon them, and yet they are not secure from or immune to the processes of the law. Motor car owners are no more likely to move their headquarters than are income tax-payers, and anyone will admit that the income-tax evader runs risks which most of us would not care to take. In collecting taxes or annual fees the burden is shifted from the collector to the one who does the paying in an amount proportionate to the size of the penalty for non-payment. Make the penalty large enough and the number of those who seek to evade tax payments can be reduced almost to zero.

Couldn't the whole matter of motor car registration payments be taken care of by a system which would provide for the payment of the fee or the return of the old plates on or before a certain day each year and for the issuance after that date to the local police authorities of a list of delinquents who could be haled to court and either locked up for a time or heavily fined upon failure to show good reason why they should not be so treated? We think it could, and such a system would conserve enough steel in one year to build one more ship and save the states about \$2,000,000 of the money they now spend for plates and a lot of work and incidental expense in handling them.

Let's turn our number plates into something essential.

## Dynamometers for Aircraft Testing

**A**LTHOUGH specifications for the testing of Liberty aviation engines state that these will be made with testing clubs, or testing propellers, word has come from Europe through some of the Allied missions that such a form of test is not to be relied upon too specifically and that some testing apparatus of more specific nature may have to be used.

It is claimed that differences of 50 h.p. are possible with propeller tests when the wind is blowing into the propeller as compared with when it is blowing in an opposite direction. More engine power is naturally required under these conditions. There is also a difference in the power required for driving a propeller when the cutting edge of the club becomes frayed as it frequently does. Once frayed, the edge must be sandpapered down and revarnished which reduces its size and again upsets calculations.

Fitting electric dynamometers for testing all of the engines will prove expensive, but undoubtedly some form of compromise will have to be arrived at if reports from European Allies are borne out by practice in America. It is known that some of the European makers use the water-brake test. This suggests the possibility of using the water-brake test for general work and for perhaps 90 per cent of the testing when using the electric dynamometer for the final test to be sure rated horsepower is obtained.

## Farm Implement Designs

**T**HE expected is happening in that the refinement of the farm tractor and the using of better materials and improved design resulting in increased efficiency, is bringing about a re-designing of farm machinery, which for years has existed on what might be called a horse-scale design.

It has been apparent at the farm tractor demonstrations that two men are needed for much farm work. The farm machinery used was designed to be drawn by horses and operated by a person seated in the rear. With a tractor pulling the machinery and the operator seated on the tractor it has been necessary for another operator for the machinery. This has not been efficient. Two men cannot be continued in these war days on a job that one man can handle.

Nothing short of a mere revolution, so far as farm machinery is concerned, has set in. It has been under way for some months. Farm machinery is being re-designed so that the man on the tractor can operate it. The farm machine is being converted from the horse regime to the motor regime.

This revolution in farm machinery design is not solely confined to designing for one-man control, but improved materials are being used. For the first time alloy steel is taking its place in some farm products. This is cutting the weight very materially. In some cases the reduction approaches 100 per cent. Every pound of weight removed from the farm machine adds to the efficiency of the tractor.

The time is at hand when the use of anti-friction bearings will be much more general in farm machinery. It is not consistent to use the finest steels, the highest standard of design, the best anti-friction bearings, etc., in a tractor and then load to it a piece of farm machinery that has not been designed on the efficiency standard. The farm machine in the efficiency sense must be a running mate with the tractor. What the anti-friction bearings do toward increasing the efficiency of the tractor they will similarly accomplish in the farm machinery. The day is almost at hand when threshing machines will use anti-friction bearings. Revolving parts in other machinery will also use them. The same precautions to keep out dust from the bearings will have to be taken as are taken in the tractor.

Another aspect of this revolution in farm machine design is that the machine must be designed for longer life than is much of the present machinery. Government departments have stated that the life of some pieces of farm machinery does not average more than 80 days of useful work. This may be spread over a period of 5 to 8 years, but this does not add to the sum total of days of work. A tractor cannot be built for 80 days of service. It should work 120 to 150 days in the year, and while the life of the present design of tractor is not statistically determined, 5 years should be used as the basis of a conservative estimate. On this basis of reasoning, a tractor should have a working life of 750 to 800 days, or approximately ten times that of the farm machinery to which it is attached.

## Will Inventory All Steel in Factories

War Industries Board Wants This to Show Quantity on Hand at Present Time—Automobile Industry is Seeking a Sixty Per Cent Steel Allotment Agreement

WASHINGTON, July 17—Hugh Chalmers, representing the passenger car makers, held a conference to-day with the War Industries Board on the question of steel for the manufacture of passenger cars, and the result of the conference is that the War Industries Board has asked for a complete inventory from the passenger car makers showing the number of partly completed cars, number of parts, as well as the quantities of steel on hand for passenger car production at the present time.

### Filing to Take 2 Weeks

Filing of these inventories will probably require 2 or 3 weeks and in the interim nothing can be done on the steel situation. It is expected that these inventories will show that the industry has not received steel on a basis of the 30 per cent reduction which was agreed upon between the War Industries Board and the industry some months ago and which agreement was to continue until Aug. 31, 1918. It is also expected that these inventories will show unbalanced stocks in many factories which will call for reasonable shipments of certain kinds of steel in order to complete the production of certain numbers of automobiles.

It is expected that the War Industries Board will announce its decision concerning further shipments of steel to the automobile industry after a thorough examination of these inventories has been made.

There seems to have been some counter-opinions concerning the steel the automobile industry has been using for some months. The makers have been operating on a 30 per cent curtailment but it is stated that since the 30 per cent agreement was entered into there have been later rulings on steel distribution and that the industry has not been receiving this allotment of steel.

### 60 Per Cent Allotment Asked

Mr. Chalmers asked the War Industries Board for a 60 per cent allotment of steel as compared with the 70 per cent allotment which the industry is operating under at present. No definite information could be given on such a request and nothing will be forthcoming until the inventories have been examined.

It has been known for some time that considerable inconvenience has been caused by the unbalanced inventories

and several factories have received good co-operation in securing quantities of steel in which they were lacking and by means of which they have been able to carry on production that would otherwise have been impossible.

During the last week the steel manufacturers have met with representatives of the War Industries Board for a general survey of steel requirements. It seems utterly impossible to get a complete budget of the requirements of the Government. New shipbuilding yards are being erected and it is impossible to estimate their requirements. The amount of ship tonnage which it is possible to build this year is being cut down and now the steel makers feel that a sane estimate of the Government's requirements will soon be available.

At present the steel capacity for this year is running on a basis of 43,000,000 tons of ingots. This will produce between 33,000,000 and 34,000,000 tons of finished steel. The shell steel requirements will approximate 5,000,000 tons for the year. These figures of ingot production represent a gain of approximately 5 per cent in steel production as compared with a year ago. In the steel industry there is a greater amount of building operations going on than formerly. New mills for ship plate production being erected and additions to others made. Many believe that the requirements for shipping will not be nearly so great as the estimates because there are not enough shipbuilding ways to possibly utilize the steel plates which have been estimated in the requirements for this year.

### Want Proper Proportioning

The steel makers are as anxious as possible to proportion steel to all of the different industries which are designated as non-essential to war work. The steel makers are also continually asking for a war budget of steel requirements and realize the almost impossible task of securing such. Their policy seems to be that of constantly cutting down estimates of Government requirements, realizing that these estimates are of necessity higher than actual needs will be.

Estimates that the Government requirements for the coming 6 months will be 20,000,000 tons are generally discounted to an extent. Steel production during the same period will, however, approximate very closely 16,500,000 tons of finished steel.

CHARLES W. NASH

### Fuel Oil Engineers Needed

WASHINGTON, July 18—The oil division of the United States Fuel Administration is looking for several engineers proficient in combustion of fuel oil and natural gas. These engineers are needed to act as inspectors in different districts where they will visit all the factories using fuel oil and natural gas, the object of their inspection being the conservation of these fuels and perhaps the pro-rating of them as necessary. The divisions in which inspectors are to be placed are: Boston, Providence, New York, Philadelphia, Pittsburgh, Buffalo, Detroit, Chicago, Minneapolis, Tulsa, New Orleans and San Francisco.

The Oil Division prefers engineers who can act as volunteers in this work at their own expense, but it is prepared to pay a certain amount for those who cannot afford to devote all of their time to this work without compensation.

### Cut Freight Rate for Road Materials

WASHINGTON, July 15—It is probable that the 20 cents per ton freight rate for stone, gravel, sand and slag promulgated by order No. 28 of the Railroad Administration will be reduced to a flat rate of 10 cents per ton. It is also probable that the 40-cent rate on brick will be cut to 20 cents. These reductions will be the result of the protest made here this week by the American Assn. of Highway Officials, Highway Industries Assn., The Portland Cement Assn. and the National Paving Brick Assn., which met with the committee under Judge Prouty and discussed the inequalities and injustices of the rates. Judge Prouty's committee hears all of the freight rate protests.

## Nash Made Aircraft Production Head

**Nash Assumes Charge as Assistant Under Ryan—Leaves Nash Motors**

WASHINGTON, D. C., July 18—Charles W. Nash, president of the Nash Motors Co., has been appointed to take charge of engineering and production of aircraft matters in America, and assumed these duties to-day. He has resigned his active connection with the Nash company for the period of the war. Mr. Nash, in this new field, will act as assistant under the direction of John D. Ryan, chairman of the Aircraft Production Board.

This appointment should result in greater co-operation in the matter of aircraft engineering and production, and consequently lead to greater production and greater unanimity of the entire aircraft program. This action should lead to bringing together all the loose ends of the aircraft program. Heretofore there has not been enough get-together among those engaged in aircraft manufacture. Mr. Nash is one of the best known production executives in the country.

From the time he went with the General Motors in 1910 up to the present time, production has been one of his greatest objectives. His accomplishment in the Nash Motors, in the short time he has had control of that organization, gives indication of what may be expected in the airplane program.

Since taking over the Jeffrey factory it has been entirely reorganized on a production basis. Practically every department has been reorganized and practically every piece of machinery repositioned on a production basis. As a production executive Mr. Nash is one of those who goes through the factory every day and is directly familiar with every phase of the work. He gets his production information first hand. He makes his production studies first hand. He is a master of the art, which, coupled with his first-hand study policy, is directly responsible for his success.

It is hoped that in his new field in charge of engineering and production for aircraft engines, as well as planes, that Mr. Nash will be given an office and his organization located at some city in the aircraft manufacturing zone. Some weeks ago AUTOMOTIVE INDUSTRIES, in referring to the desirability of a director for aircraft work, suggested locating such a person in Dayton, Ohio, or per-

haps some other city in the zone of this work. Just as Charles M. Schwab located the construction end of the Shipping Board in Philadelphia, so the engineering and production end of the aircraft program should be located in some city which would serve as a center of aircraft engineering, research engineering and be a large production center as well.

Mr. Nash was born near De Kalb, Ill., Jan. 18, 1864, and first became connected with the automobile industry through the Durant-Dort Carriage Co. In the fall of 1910 he was appointed general manager of the Buick Motor Co. and in 1912 became president of the General Motors Co. In July, 1916, he resigned the presidency of the General Motors Co. to form the Nash Motors Co., which took over the Thos. B. Jeffery Co., Kenosha.

## Wages Increase in Automobile Industry

WASHINGTON, July 16—Payrolls in the automobile industry for wages during April, 1918, show an average increase of 10 per cent over April, 1917. Fifty factories report 117,352 workers on the payroll for April, 1918, as against 125,407 in April, 1917. In spite of this, the payroll total increased from \$2,761,526 in April, 1917, to \$2,846,438 last April.

One automobile factory reported an increase of 25 per cent in wages as compared with an increase of 15 per cent in employees. An increase of 10 per cent to the foundry division of a passenger car factory was reported by another company. The foundry force equalled approximately 8 per cent of the organization. Eighty per cent of all employees in another plant received increases ranging from 7 per cent to 8.5 per cent, and about 90 per cent of the force of another establishment received an increase of approximately 10 per cent. The average productive hourly rate in each plant was increased 0.0067 per cent. Another factory reported an increase in the productive hourly rate but gave no data.

## Copper Concentrates Restricted

WASHINGTON, July 17—No licenses will hereafter be issued for the importation of copper concentrates containing less than 60 per cent of copper except for shipments from Cuba, Canada, and Mexico. This restriction is not to be construed as affecting importation of copper matte, blister copper or copper concentrates containing 60 per cent or more of copper, from any non-enemy country. The purpose of the new ruling is to bring about ocean transportation of copper in a concentrated form rather than as bulky ore.

## Lack of Steel Causes Production Cut

**Detroit Manufacturers Cannot Get Supplies—Parts Makers Are Short, Too**

DETROIT, July 16—The critical steel situation is causing a cut in passenger car production in this territory and there is a difference of opinion as to just how long this will last. While the curve of passenger car production is rapidly declining, the curve of motor truck production is showing a steady upward tendency. Comparing production figures of May with those of to-day the average reduction in output of passenger car manufacturers would be approximately 33 1/3 per cent. The greatest cut in production is 50 per cent while many companies are suffering only a 25 per cent decrease.

A number of manufacturers, however, have not felt the necessity of decreasing their output and have been maintaining the same production since May. Among these are Packard, Overland and Hupp. Hupp shipped 1053 cars during June.

Much optimism is expressed regarding the steel situation. Manufacturers are inclined to think that it will be clarified within the next 60 or 90 days and that everything will be running much more smoothly then. It is generally conceded that conditions at Washington are in a rather unsettled state and manufacturers cannot be expected to feel easy until the turmoil there ceases. So many rumors originating in Washington have been current here that manufacturers are now turning deaf ears to them.

It is reported that the Ford Motor Co. is now producing 750 passenger cars as compared with 1550 during May. The production of the Paige-Detroit Motor Car Co. averages thirty-five cars daily as against fifty during May. Oldsmobile represents a cut in production of 33 1/3 per cent, now making 65 to 70 cars daily. Dort Motor Car Co. production has decreased almost 50 per cent. The Paige factory has 4000 orders for cars on its books which it expects never to be filled.

## Demonstrates Wire Cutter

WASHINGTON, July 13—John E. Logan, Kansas City, Mo., construction engineer, demonstrated a barbed-wire cutting machine attached to an armored tank at the Capitol grounds yesterday. Members of Congress and Army officers were present, and were gratified by the demonstration. Mr. Logan has offered his invention to the Government.

## Device Combines Horn and Lamp

**Invention of Molyneux and  
Stowe Will Be Marketed by  
the Wire Wheel Corp.**

NEW YORK, July 10—The Wire Wheel Corporation of America has secured the patent rights to an interesting new automobile device, a combination lamp and horn. It is the joint invention of George Stowe and George E. Molyneux, both well known in the eastern automobile trade, Mr. Stowe being president of the Mitchell Automobile Co. of New York.

One advantage claimed for the combination is that it effects a marked saving in material, as the horn casing, bracket, trumpet, screws and clamp are rendered unnecessary. By combining the horn with the lamp the former is of course placed directly in front of the car, where it should be most effective. Enclosed in the lamp shell, the horn is protected from dirt, grease, oil and dust.

The construction worked out by the inventors is as follows: Near the rear of a standard lamp of the familiar bullet type, and below the horizontal diameter of the lamp, a hole is made, and the metal edges are turned up and ferruled. This aperture is slanted both downward and rearward, to prevent rain beating in, or the careless flooding of the lamp by the car washer. The ferrule becomes the supporting member of the signalling device, as well as the trumpet or mouth of the horn, as this is the opening through which the signalling sound is emitted.

The mechanism of the signalling device may be of any of the types now in common use. It is either made integral with or connected to the ferrule, and fits snugly in the rear of the lamp, back of the reflector. With the vibrator type of electric horn, the standard lamps are untouched, except for the making of the one hole, the bulb arrangement is not disturbed, and the wires of the horn are threaded through the tubular member of the lamp and its regular supporting post with the lighting leads. No outside wires are required.

It is not yet known what the intentions of the Wire Wheel Corporation of America are regarding the exploitation of the newly acquired rights. It is understood that the concern has a large plant at Springfield, Mass., at which the production of wire wheels was stopped when the war broke out, and which is now devoted to Government work. If the corporation should desire to enter into the manufacture of the combination lamp and horn this plant would evidently be selected for the purpose, as wire wheel manufacture could be concentrated at the enlarged main plant at Buffalo.

### Concession on Body Freight

WASHINGTON, July 15—Whereas a 33 1/3 per cent increase in the freight rates on bodies was proposed 6 months

ago, the increased classification has been applied mostly to enclosed car bodies, according to a decision handed down to-day by the Interstate Commerce Commission. Open car bodies are little changed. The rate applies only on Eastern roads and not on those in the West and South.

The rates in the East, South and West, which are the three railroad rate divisions of the country, were three times first class on all bodies. When the rates were raised last fall all bodies were listed as four times first class in the East. No change was made in the three-times-first-class rate in the West and South.

The National Automobile Chamber of Commerce asked for a temporary suspension of this increase and for a hearing, which were granted. The hearing was held in January. The result is that the rate is raised to four-times-first-class on all bodies over 36 in. in height and remains three-times-first-class on bodies under 36 in.

A comparatively small percentage of touring and roadster bodies exceed 36 in. in height, which causes the rate to affect enclosed car bodies mostly. The arguments of Traffic Manager J. S. Marvin, of the N. A. C. C., at the hearing were mostly technical and did not relate to the essential character of different classes of bodies.

### Hear Major Rice in Aircraft Inquiry

WASHINGTON, July 13—Members of the aircraft sub-committee of the Senate Military Affairs Committee held a secret examination to-day of Major C. A. Rice, of the American aviation service, who recently returned from France. Nothing was made public except that the testimony was technical and that the committee members were convinced that the American aerial fighting machines compare favorably with the types used by the Allies. It is quite likely that the report of the sub-committee investigations will not be completed for some time.

*Internal construction of the combined horn and lamp to be marketed by the Wire Wheel Corp.*

## Order Reduction of Plow Types

**War Industries Board Decreases  
Number as an Iron and Steel  
Conservation Measure**

WASHINGTON, July 13—For the conservation of iron and steel, the War Industries Board has ordered a reduction of more than 3000 types of plows and tillage machinery for the farm. Out of 303 types of plows only sixty-five will be continued after Dec. 31, 1918. Of 300 types of corn planters and drills only ten will be continued, and of 107 types of harrows only forty-four will be continued after this date.

This reduction in number of sizes will do a great deal to reduce the size of stocks carried by the manufacturers as well as by distributors and dealers and will consequently lower the required capital needed for carrying on business. It has been known for some time that there were too many models of different kinds of farm implements, but such a broad pruning of the list was not expected.

The plan was the result of co-operative work by the industry. The tractor plows that are involved follow:

Light tractor plows, rigid beam, power lift, 2, 3 and 4 bottom, 2 wheel, will be made in 10-, 12- and 14-in. only.

Heavy tractor plows 14-in. only will be made in 4, 5, 6 and 8 bottom only.

Medium duty tractor plows, rigid beam, power lift, 3-wheel, will be made in 3 bottom 14 in. and 4 bottom 14 in. only.

Heavy engine disk plows will be restricted in manufacture to one type to each maker with 2 to 10 disks, set and equipped to cut from 20 to 100 in.

Light tractor disk plows will be restricted to one type only by each manufacturer, equipped with 2, 3, 4 and 5 disks.

### Canadian Ford Plant Closes

FORD CITY, ONT., July 12—About 2700 workmen of the Ford Motor Co. of Canada were thrown out of employment when the plant closed its doors last week. Shortage of raw materials is said to be one reason for the shut-down. The plant has used the large stock of raw material imported before extra duties were placed on such articles by the Canadian Government, and other stocks are said to be unprocureable. Officials of the company would make no statement other than that it is their usual custom to close the plant every summer for an inventory lasting 2 weeks or more. The shut-down is considered a "lock-out" by employees, who recently made demands on the company for increased pay, amounting to 62½ cents an hour, or \$5 for an 8-hr. day. More than 3000 men will be affected, as the plants of the Fisher Body, Kelsey Wheel and Dominion Stamping companies, which are engaged in turning out parts for the Ford company, will be placed either on curtailed production or enforced layoffs. It is probable that the Government may take over the plant.

## Car and Parts Curtailment Need Not Be in Proportion to Fuel Reduction

### Coal Allowance to Manufacturers Will Not Be Estimated in Terms of Quantitative Output of Factories

WASHINGTON, July 15—The coal curtailment for 1918-1919—probably a 75 per cent cut—will not necessarily reduce the manufacture of passenger cars or parts 75 per cent.

The United States Fuel Administration will not estimate its coal reduction by a quantity car or parts reduction.

If a manufacturer of passenger cars or parts reduces his coal consumption for these commodities 75 per cent, but discovers an honest method for maintaining his production at 50 per cent of the 1917-1918 period, for example, the Fuel Administration will approve such activities.

In fact, the Fuel Administration is in favor of the greatest production possible and compatible with the 75 per cent coal reduction. This was made clear to-day by the Administration in reply to inquiries by AUTOMOTIVE INDUSTRIES.

The coal allowance to passenger car and parts manufacturers will not be estimated by enforcing a curtailment in the number of passenger cars or parts.

#### Methods of Estimating

It will be estimated by taking the requirements of 1917-1918 non-war work and cutting it 75 per cent, allowing 25 per cent of the coal consumption last year for non-war work for the 1918-1919 period.

It will apply only to passenger cars, as trucks and tractors, and the parts for these are considered as war work by the Fuel Administration.

In order to ascertain the proper amount of coal to be used for non-war work manufacturers will be expected to estimate accurately the coal consumption for the 1917-1918 period. They will be expected to deduct 75 per cent from this and use the remainder as a guide for their 1918-1919 requirements. They will be allowed 100 per cent coal for war work. They will not be allowed to use more than 25 per cent of the coal they have for non-war work regardless of the amount of coal they may have on hand.

#### Can Prevent Over-Consumption

While it is doubtful if the United States Fuel Administration has the power to take the surplus coal away from an owner, it has the power through the Lever Act to prevent the owner of that coal from consuming more than the amount prescribed by the Administration regulations.

Manufacturers engaged solely in non-war work can easily learn their position for the 1918-1919 period by checking up the coal requirements for the 1917-1918 period and allowing 25 per cent of that amount for the 1918-1919 period. Manufacturers engaged in non-war work and war work will be expected to observe the following plans:

- 1—Estimate accurately the average amount of coal per piece produced required for heat and power, basing these figures on the 1917-1918 period.
- 2—Estimate accurately the total amount of coal required for the period Aug. 1, 1917, to Aug. 1, 1918. Take 25 per cent of this as the coal allowance for non-war work for 1918-1919.
- 3—Estimate accurately the total amount of war work engaged in. Find the amount of coal required by using the coal per piece rate. Allow 100 per cent coal requirement for the war work.
- 4—Order 25 per cent of coal for the non-war work. Order 100 per cent of coal necessary for the war work. This will be the total coal allowance from the United States Fuel Administration.

In using the figures "25 per cent," it is necessary to add that these are approximate.

The United States Fuel Administration has not yet definitely decided upon the actual allowance of coal to the automobile industry.

Dr. Harry Garfield has indicated that it will probably be 25 per cent of the 1917-1918 requirement for the 1918-1919 period.

#### Entire Matter Vague

The entire matter is as yet somewhat vague in the minds of the Fuel Administration.

It is not certain of the exact percentage curtailment nor of the methods of procedure in special cases.

It does not know, for instance, what would be done in the instance of a manufacturer of parts who in 1917-1918 not only supplied passenger cars made during that period but millions of passenger cars made in previous years.

Following is an example of how the manufacturer can approximately ascertain his coal allowance for the 1918-1919 period:

A. B. & Co. manufactured 3000 passenger cars Aug. 1, 1917-Aug. 1, 1918.

A. B. & Co. consumed 3000 tons of coal Aug. 1, 1917-Aug. 1, 1918.

A. B. & Co. have war contracts for 1300 passenger cars or for other materials using 50 per cent of plant.

The United States Fuel Administration allows:

One hundred per cent coal requirements for the war work for 1918-1919.

Twenty-five per cent of the 1917-1918 coal used in 1918-1919.

Using 3000 tons of coal for 3000 passenger cars, A. B. & Co. average 1 ton of coal per car.

Being allowed 100 per cent coal for war work, it orders for war work 1500 tons (war car order or 60 per cent of

last year's consumption to meet the 50 per cent war work in their plant).

Being allowed 25 per cent of the coal consumed in 1917-1918 for non-war work, it orders for non-war work 750 tons of coal, which is 25 per cent of the 1917-1918 consumption. Thus the complete order is: 1500 tons for war work, 750 tons for non-war work, 2250 total allowed for war and non-war work, which is 75 per cent of the 1917-1918 coal.

#### Holiday Lessens Coal Production

WASHINGTON, July 16—Bituminous coal production for the week ending July 6 was 10,250,000 tons as against 12,340,000 tons in the preceding week. The decrease of 17 per cent was caused by the observance of July 4. The daily average production for the operating days was practically the same as that of the previous week of 1917. The production for the 5-day week amounted to 1,000,000 tons more than for the corresponding week of 1917.

Anthracite shipments during the week of July 6 amounted to 31,493 cars as against 41,641 cars, a loss of 25 per cent, also due largely, according to the Fuel Administration, to observance of July 4.

During the week of June 29 the mines operated 84.3 per cent of their full time capacity. Losses against production were: Car shortage, 7.8 per cent; labor shortage, 0.8 per cent; mine disability, 2.8 per cent; no market, 1.2 per cent; all other causes, 3.1 per cent. Car shortage losses in West Virginia were 28.4 per cent, and in parts of Kentucky, 36.5 per cent. Material losses on account of car shortage were also shown in Pennsylvania, Illinois and Indiana.

#### Labor Shortage Continues

WASHINGTON, July 12—Continuing shortages of common labor are reported by the weekly labor service of the United States Employment Service. Of the 100 offices which reported for the week ended June 29, 72 show a serious shortage. Three cities in California and 3 in Texas show a surplus of common labor, while 3 cities report normal conditions.

Common labor is especially scarce from Long Island Sound to the mouth of the Chesapeake River. The United States Employment Service is arranging to send men from Maine and Massachusetts, where the lack is not so serious, to meet this shortage. Common labor is greatly in demand from South Carolina to Texas, and in the North Central states, excepting Indiana, where there has been some surplus. In the mechanical and skilled-craftsmen divisions, there is a small but noticeable improvement due to the recruiting of skilled workmen and machinists by the United States Employment Service.

#### Tractor Plant for Texas

ORANGE, TEX., July 15—The Blumberg Mfg. Co., San Antonio, will build a plant here for the manufacture of farm tractors. The new tractor will be adapted specially for use on rice plantations.

## Labor Recruiting Plans Complete

### U. S. Employment Service Will Cooperate with Factories to Get Unskilled Men

WASHINGTON, July 16—Federal transfer of labor from non-war to war work will begin Aug. 1. At the same time employers engaged in war contracts and with organizations numbering more than 100 workers will recruit all workers solely through the United States Employment Service of the Department of Labor. It is anticipated that through these plans 4,000,000 workers will be shifted from non-war to war activities within the next few months.

The classifications of preferred industries as made by the War Industries Board in its steel schedule, and previously published in AUTOMOTIVE INDUSTRIES, will be followed by the Department of Labor.

Instructions were sent out to the war industries late last week following a 3 day conference of employment managers, state employment agents and officials of the United States Employment Service, authorizing war industries with field service forces to recruit labor under certain conditions after Aug. 1, in co-operation with the United States Employment Service. The full instructions are as follows:

Order blanks for workers are sent to each employer to be filled out and returned, within 24 hours, to the man in charge of labor recruiting for the United States Employment Service in the State where the factory is located. The information sought by the blank is used to ascertain the total requirements of industries for unskilled labor, and the requirements by states for each particular industry and factory. Filling out and returning the blank does not mean that a manufacturer will obtain immediate relief of labor shortage. This is the goal aimed at for the future.

As soon as an employer fills in his order he will be notified by the United States Employment Service of the office and agent assigned to co-operate with him in getting the unskilled labor. The employer should immediately get in touch with this agent.

The total of the present needs of the war industries for unskilled labor will be divided into quotas among the states and sub-divided among communities. Vigorous efforts will be made in each community to secure the allotted quota in such a manner as to prevent taking labor from war industries or firms or needlessly crippling non-war industries. So far as possible recruiting for each plant will be centered in certain definite states and localities.

Employers with a field force for recruiting labor may continue these organizations under the direction of and subject to regulations of the United States Employment Service. Authorization for continuing such organizations is to be secured from the men in charge of the

work of the United States Employment Service in the state in which the company is located. Such authorization is subject to withdrawal at any time, but will be continued so long as it works satisfactorily.

In order to stabilize labor recruiting and distribution a Community Labor Board will be organized in each community, made up of a representative of the United States Employment Service, a representative of the workers and a representative of the employers. It will assist in recruiting local labor, but its principal function will be to decide on the relative needs of local establishments and prorate labor supply when it is inadequate.

#### Labor Administration Organization Completed

WASHINGTON, July 13—The new bureaus of the War Labor Administration of the Department of Labor as finally organized are:

Women in Industry Bureau—to deal with problems involving women.

Conditions of Labor Bureau—to set up and administer conditions of labor, including safety, sanitation, etc.

Training and Dilution Bureau—to train workers for war occupations. This organization will have jurisdiction where industries lack skilled workers and it becomes necessary to dilute the skilled supply with those who are less skilled.

Bureau of Labor Adjustments—to have jurisdiction over strikes, lockouts, etc.

Insignia Service—to reward war workers by means of badges, etc.

Investigation and Inspection Service—to handle investigations other than statistical.

#### Condemns Competition For Labor

WASHINGTON, July 12—The using of competitive peace-time methods in the procurement of labor is strongly disapproved by a resolution of the War Industries Board. Henceforth the Board, through its Priorities Division will in proper cases withhold priority assistance from employers who persist in using competitive peace-time methods which result in the withdrawal of labor from war industries.

#### Repairmen Not to Be Reclassified

WASHINGTON, July 12—Repairmen in garages and repairshops will not be affected by the "Work or Fight" order recently promulgated by Provost-Marshal General Crowder. This ruling was made to-day by the office of the Provost-Marshal here and is definite. It does not matter whether the repairmen are working on trucks or passenger cars, according to the office of the Provost-Marshal, and those local draft boards which are reclassifying repairmen under the order are acting without proper authority.

#### Calls Men to Cut Spruce

WASHINGTON, July 13—Provost-Marshal General Crowder yesterday issued a call for an additional 3000 men from 38 states to cut spruce wood in the forests of the Northwest for airplane construction.

## How Women Should Be Employed

### Statement of the Government's Attitude Toward the Use of Female Labor in War Work

WASHINGTON, July 13—The shortage of labor in essential war industries should be met so far as possible by the increased use of women in clerical and office positions. Women should not be employed in occupations physically or morally unsuited to female labor. These and other principles setting forth the Government's attitude for the employment of women in the war emergency are included in a resolution issued by the War Labor Policies Board here to-day. The resolution will govern the work of the new division of Women in Industry of the Department of Labor which was created this week. The resolution is in part as follows:

The existing shortage of labor aggravated daily by the military and naval demands of the Government and the withdrawal from civilian occupations of a quarter of a million additional recruits each month necessitates widespread recourse to the labor of women.

Standards as to hours, night work, wages and other labor conditions, as recommended by the Chief of Ordnance and the Quartermaster-General should be observed by all employers.

The shortage of labor in essential war industries should be met in part by further introducing women into occupations easily filled by them, such as clerical, cashier and accounting service in manufacturing, mercantile and financial establishments and in the offices of transportation companies and other public utilities; such as sales clerks and floor walkers in mercantile establishments.

Women should not be employed to replace men in occupations or places of employment clearly unfit for them owing to physical or moral conditions, as for instance, in bar rooms, saloons, pool rooms, mines, smelters, quarries, furnace work, glass works, etc. Girls under 21 years of age should not be employed where it is clearly unfit for them owing to their youth, as for instance in public messenger service, street car, elevated and subway transportation, as elevator operators or bell boys.

The introduction of women into war industries or other employments involving special hazards such as the use of industrial poisons should be guided by the standards of health, comfort and safety as defined by the various Governmental departments.

Introduction of women into new occupations should be guided by regulations concerning hours of labor, night work, etc., as adopted for instance by the Industrial Commission of Wisconsin.

Recruiting of mothers of young children for war industries should be discouraged.

Introduction of women into positions hitherto filled by men should not be made a pretext for unnecessarily displacing men.

The services of the division of women in industry should be sought by employers with regard to introduction of women in industry and the working conditions which should be established.

Older men should be more generally employed. They constitute a largely unused labor reserve. It is estimated that since the

war began the maximum age for employing men has advanced 10 to 12 years, that is from 38 to 50. It has been found that tasks can be graded for these workers according to their strength, and that work unsuitable for women, especially at night, can be performed by them.

#### Deliver 2514 Liberty Engines

WASHINGTON, July 16—The delivery of Liberty engines for all purposes on July 5 was 2514. At the same time 450 DH-4 or DeHaviland battleplanes, each designed for two men and fitted with four machine guns, had been shipped.

Rumors are beginning to be spread in Washington as to the report of the Senate Military Affairs Committee which is investigating the aircraft situation and whose report will be filed soon. This committee has visited many of the aircraft factories. Undoubtedly this report will deal largely with Liberty engine production as well as the manufacture of battleplanes.

Members of the Aircraft Committee state that quantity production has just been arrived at in the matter of engines, and that the Handley-Page and Caproni types are now starting in production. They say that for these types "the Liberty engine cannot be beat."

#### Marmon Delivers First Liberty Engine

INDIANAPOLIS, July 15—The first Liberty engine to be completed by the Nordyke & Marmon Co. ended its 50-hr. trial run, 55 min. after midnight Saturday and has been accepted by government officials, who came from Detroit to inspect it.

Following the long period test, the engine was taken apart and each unit examined separately to determine what wear or strain, if any, was visible after the endurance run. For most of the time the engine was on the block, a normal speed of 1650 r.p.m. was maintained, and for shorter spaces higher speeds were attained.

The Nordyke & Marmon plant will immediately enter upon quantity production. The company has already built and delivered 1000 Hall-Scott engines and completion of this order has delayed production of Liberty engines.

#### A.E.F. Motor Transport Corps Organized

WASHINGTON, July 16—Motor truck transportation in France has been made an entirely separate division of the Army and will hereafter be called the "Motor Transport Corps."

#### Packard Not to Change Its Car

DETROIT, July 15—The Packard Motor Car Co. will continue its present 12-cylinder passenger car model substantially without change for an indefinite period.

#### G.M.C. to Erect Body Plant

ST. LOUIS, July 12—The General Motors Corp. has purchased a plot of 105 acres here, and, it is stated, will erect a plant for the manufacture of bodies.

## South Africa Using New Motor Fuel

### Natalite, a By-Product of Sugar Is Found to Be Cheaper But Less Efficient Than Gas

JOHANNESBURG, SOUTH AFRICA, May 25—Natalite, a bi-product of sugar is being used as an automobile fuel in this part of South Africa. Although this fuel is not nearly so satisfactorily as gasoline or kerosene due to carbonization of the engine, there is nevertheless a good deal of interest in it because it is much cheaper than imported gasoline and kerosene. It is being sold at 75 cents an Imperial gal. in wholesale quantities, and at points on the coast at a lower price. Gasoline is selling at \$1 a gal.

In addition to carbonizing the engine, natalite does not give as much power as gasoline and kerosene. The feeling is that its quality as a fuel can be improved and distributors are looking forward to it with interest.

A shortage of gasoline is one of the automobile problems of South Africa. It has resulted in a large number of automobiles already being placed in storage. Gasoline has been as high as \$1.25 per gal., and the price generally ranges between \$1 and this figure. Some of the distributors have recently imported large quantities of American gasoline, but the economy has been slight in so far as price is concerned.

Considering the population of South Africa, the number of automobiles imported and sold is great. The entire white population is little more than 1,000,000, which is one-fifth that of Australia and about one-ninth that of the Dominion of Canada.

The demand for motor trucks is not large and is confined principally to larger cities. A possible exception is that territory known as the South Western African Protectorate, which is a sparsely populated section and one in which motor trucks are badly needed.

On some of the larger farms of the Cape Province, farm tractors have been introduced but it will be some time before the tractor will be an attractive proposition to the South African distributor. The cheap price of oxen which cost the farmer nothing, is largely responsible for this. Another fact is that the native farmer is ignorant of machinery, and the tractor would be badly abused in his hands. The sale of automobiles to the farmer is a useful missionary work since it educates him for the tractor.

#### British Aircraft Production Increasing

LONDON, June 28—During the 3-month period from March to May, production of airplanes in England increased 116 per cent over deliveries from June to August, 1917, according to a statement by the Aircraft Production Department of the British Air Ministry. In the same 3-month period, production of engines increased 105 per cent. The statement

adds: "The increase in the fighting value of the airplanes is very much higher than these figures would indicate, as the engines delivered during the 3 months just completed are of a much higher and more powerful type than those delivered during the 3 months of 1917." At the present time there is a considerable quantity of planes in storage ready for engines, but it is anticipated that these will be fitted in the near future.

#### Housing Corporation Formed

WASHINGTON, July 14—The United States Housing Corp. has been created to take over the functions of the Bureau of Industrial Housing and Transportation of the Department of Labor. This new organization is expected to afford more facility in operation. The charter was taken out under the laws of New York State. The articles of incorporation provide for issuance of 1000 shares of stock without par value, of which the Government holds 998 shares and O. M. Eidlitz and G. G. Box one share apiece.

The executive officers of the corporation are: President, Otto M. Eidlitz; vice-president, Joseph D. Leland; treasurer, George G. Box; and secretary, B. L. Fenner. These, together with Albert B. Kerr, J. W. Alvord and William E. Shannon, will serve as directors.

#### Engines for Ordnance

NEW YORK CITY, July 17—The Trego Motor Corp., New Haven, Conn., which was given a contract to manufacture Liberty aircraft engines for aircraft purposes, has transferred its manufacturing activities from aircraft to the Ordnance department. It will continue the manufacture of the Liberty engine, but for Ordnance purposes. This company has gotten into production in a small way, but has facilities for approximately twenty-five engines per week. The factory is well fitted up for dynamometer testing of these engines, having two Sprague testing units capable of handling 800 hp. engines and four other units capable of handling 400 hp. Although the Trego corporation has not been in production to any extent it has for many months been producing parts for the Liberty engine in quantity.

#### Badges for War Workers

WASHINGTON, July 16—War badges for industrial workers employed at least four consecutive months in Government war industries, will be issued through the U. S. Employment Service according to a new plan just announced. The badges will comprise some design not yet completed of service bars. They will be given to workers in those industries where work is in sufficient volume and importance to require the supervision of a Government official or a plant certified by the chief of a Government department as sufficiently important in war work to merit badges.

General Lee of the British Mission ready for a flight in his Avro plane

General Lee landing with a passenger after a flight with loops and spiral falls

## Planes Hover Continually Over the American Capital

WASHINGTON, July 12—Flying has become a daily event here with the construction of a large hangar at Potomac Park housing several Curtiss J-N 4 airplanes. A DeHaviland airplane equipped with two Liberty engines has just been added and two Spads are expected shortly. In addition there is an Avro airplane here, shipped from England, built by A. V. Roe & Co. and equipped with a 100-hp. Nome engine. The Avro plane is the property of the British Mission and is used exclusively by General C. F. Lee who heads the British Aeronautical Mission in this country. General Lee was practically the first flier to exhibit the maple leaf drop, the "Immelman" loop, the spiral fall and the other "stunts" used at the front, in Washington. His exhibits have been watched with great interest by President Wilson and the various War Department officials.

Many fliers are stationed in the aviation section in Washington at desk work. In order to maintain their records and to secure the 25 per cent extra monthly pay allotment awarded to fliers provided they are in the air a certain number of hours each month, these men make frequent use of the Curtiss J-N 4 planes. Several may be seen flying each day at all hours, over the State, War and Navy buildings, the White House and the city proper.

### New Export License Regulations

WASHINGTON, July 15—Partial shipments from interior points or ports of exit where licenses can not be readily presented, will no longer be allowed by means of the special partial shipment certificate sworn before a notary public, or a certificate of transfer drawn by a collector of customs. The use of these forms, EAB-23 and WTB-176, were discontinued on July 10.

Partial shipments against export licenses may be made in the following manner except in instances when the license itself can be presented at the port of exit:

The shipper will prepare a Shipper's Export Declaration in quadruplicate and will endorse upon the back of the license in the space provided for the purpose the full details of the partial shipment he desires to make. He will then present the Declaration (4 copies) and the license (with the partial

shipment endorsement on the back) to any postmaster of the first or second class or to a collector of customs. The postmaster or collector to whom the papers are presented will compare them and if they agree in fact, that official will countersign and date the partial shipment endorsement on the back of the license and will stamp all 4 copies of the Shipper's Export Declaration with an official partial shipment stamp and sign and place his seal on such stamp. He will then return the license and all 4 copies of the Declaration to the shipper. The collector of customs at port of exit will allow the partial shipment to proceed upon presentation of the Declaration, so stamped, signed and sealed.

Shippers located in cities where there are no collectors of customs but where the post offices are of the first or second class, may communicate with their postmaster and ascertain at which post office station, if more than one, and at which window this service will be rendered. The attention of shippers is called to the fact that postmasters in cities wherein are located collectors of customs will not exercise this authority. Shippers in such cities may apply to a collector of customs.

### Navy Workers Needed

WASHINGTON, July 12—Workers are needed to assist in building seaplanes in the Naval Aircraft factory at the Philadelphia Navy Yard. The plant, which builds seaplanes for hunting submarines and serving as convoys to merchant ships, is being expanded, and several thousand workers are required. It is not considered desirable to take the workers from other aircraft factories or from any concerns engaged in Government work. There is a scarcity of men to work on the bracing wires which support the wings and hull of the seaplane. Men experienced in splicing small woven wire cables are preferred. Tube benders who have worked on bending small steel tubing in bicycle factories or furniture factories are needed. Coppersmiths, acetylene welders and braisers for work on metal parts, and a limited number of tool designers and tool makers are required. Boat builders who have designed or built small racing boats or schooners can be used to advantage in building the hulls.

In the final assembly of the seaplanes, men who have worked on assembly of automobiles are needed. Active, intelligent young men with but slight experience in handling of tools and who are taking engineering courses in colleges or universities are also sought. In fact any man with 6 months' experience at shop work can obtain a job.

## Detroit's War Contracts Will Reach \$2,000,000,000

DETROIT, July 16—In all probability, \$2,000,000,000 worth of war work will be in the city of Detroit within the next twelve months, according to J. Hubbert Cullen, secretary of the Resources and Conversion section of the War Industries Board for Michigan. This means that Detroit manufacturers will be working on an amount about double the present contracts.

At the present time 90 per cent of all Detroit's industries are working on war contracts or sub-contracts, but in comparatively few cases are the plants engaged to capacity. In many cases the proportion of war manufacture is as low as 5 per cent. In such plants the production of war needs will be greatly increased. These estimates are based on Mr. Cullen's recent survey of Detroit's industries.

At present this city leads the country in the percentage of industries working on munitions, but the large contracts are concentrated in the larger factories and it is expected that the future will see all factories, large and small, use their facilities for war work. In many cases factories are not equipped to take war contracts but the majority can be converted to this character of work with little difficulty. As an instance, there is one wood-working factory which occupies only 5 per cent of its facilities for airplane body work. This factory alone could turn out hundreds of completed bodies a week.

### Government Trains 12,000 Men

WASHINGTON, July 15—More than 12,000 men have been trained for the United States Army through the war trading division of the Federal Board for Vocational Education. Six thousand of these were trained in mechanical lines, 5000 in radio work and 1000 in clerical occupations. It is estimated that an additional 3000 men have been trained by private agencies through impetus given to the work by the Federal Board, using Federal Board courses of instruction.

### Grossman Gets Post Office Contract

NEW YORK, July 12—The post office department in Washington has awarded a contract for Red Head Vitristone spark plugs to the Emil Grossman Mfg. Corp.

## Truck Sales Are Good on Seaboards

### Detroit Territory Coming Back After a Month's Lull—Many Trucks Idle

DETROIT, July 16—All truck manufacturers in Detroit territory report very brisk business on the east and west seaboards, but throughout the middle of the country in sections a lull in sales is manifest. Although there are scores of prospects in these sections and the desire to own trucks is present, the sales are backward. A depressed condition seems to prevail.

This condition, the manufacturers state, is only temporary and are optimistic about it; many producers already see an easing up of the situation and note a slight increase of sales in some parts.

The city of Detroit is just coming out of such a lull. During June the truck business, it is reported by most retail agencies, has been at a standstill and none was able to determine the cause. Most persons lay it to the fact that solicitations for various war activities swerved money to other channels; others are of the opinion that this territory is oversupplied with trucks, while still others are satisfied with the thought that the depression is a natural one at this time of the year.

It is a fact that Detroit has an oversupply of dump trucks at this time. When the city was enjoying its building boom some time ago a large number of individuals entered the building and contracting business and bought great numbers of this type of trucks. Now these vehicles are standing idle in many garages, only a few being converted into types suitable for regular truck service. It seems enough work cannot be found to keep all these idle trucks in use. One local contracting firm that owns over one hundred trucks has an average of thirty to forty trucks idle every day and has found it necessary to advertise that it has vehicles for outside service.

The sales of many manufacturers show a decrease of 20 per cent in this territory. It is believed that the South will be the first section to come out of its state of depression, due to the coming cotton crop. The east and west coast have been active because of the great quantities of material handled there; there is more moving in these sections.

The decreased use of trucks has caused a corresponding lessening of tire sales. The Detroit branch of the B. F. Goodrich Co. reports a marked dropping off of business in the truck tires sales. This condition is noted with other tire agencies.

#### U. S. Rubber Sales \$100,000,000

NEW YORK, July 15—The United States Rubber Co. in the 6 months ended July 1 did a gross business of approximately \$100,000,000, which is only \$16,-

000,000 less than the sales of all of 1916. In 1917 sales amounted to \$176,000,000. More than 15 per cent of the company's business at present is government work. In the order of importance, from the standpoint of Government contracts, the various departments rank: First, boots and shoes; second, tires; third, mechanical goods.

The tire business of the company, on sales to dealers in the first half of 1918, showed a large gain over 1917. Tire business is divided into two departments: Sales to dealers and sales to manufacturers of automobiles. Sales to manufacturers are less than those of last year. The company is finding it difficult to manufacture enough tires to satisfy the demands for cars built before Jan. 1, 1918.

#### First Eagle Launched

DETROIT, July 12—Without a semblance of ceremony and with less than a hundred spectators outside of the Ford employees and the naval men, Ford's Eagle-1 was launched yesterday. With hardly a hitch, the 200-ft. boat was brought out of its housing and lowered into the water.

Unlike other launchings where boats are built at the water edge, the Eagle had to be conveyed a distance of about 500 ft. before it could be placed in the water. This new type of sea-fighter or submarine chaser is assembled on a long conveyor resembling an elongated freight car. When completed the boat is pulled on its conveyance to a transfer table and brought to the launching well.

The transfer table is a large square area sunk about 3 ft. below the floor of the construction building, and on this are 16 parallel railroad tracks placed about 15 ft. apart. A trestle-like construction with a small engine house abutting one side, in the middle, spans these tracks. This contrivance also has four tracks, and receives from the construction building the conveyance on which the boat is resting and carries it to its launching place.

Here the boat is pulled off the carrier with a cable onto tracks on another platform which is then lowered by means of hydraulic power and the boat is floated.

The boat resembles a speed boat with its tapering bow and blunt stern. It will draw 8 ft. when fully equipped and ready for sea. The motive power is a steam turbine geared to the propeller shaft on which is mounted a single three-bladed screw. Crude oil fuel will be used to generate steam. The tank capacity of the boat is sufficient for a steaming radius of at least the distance across the Atlantic Ocean.

There is not a forging or a rolled beam in the ship. Everything is pressed from sheet metal, cold, by means of automatic machinery that cuts every piece to an exact pattern, then punches the rivet holes and bends every part to its final shape.

It will not be long before the next Eagle will go through a like program. It is expected that ultimately the plant will reach a production of one a day.

## Goodyear Employs 3000 Women

### Female Labor Successfully Used on Large Variety of Tire Operations

AKRON, OHIO, July 16—According to figures given out by the labor department of the Goodyear Tire & Rubber Co. nearly 3000 women and girls are now employed in that plant, many of whom are doing work which requires a high degree of skill. It is estimated that women are now turning out 20 per cent of the company's products.

Among the things which the women are doing are finishing tires, cutting and splicing fabrics for balloons, weighing rubber, molding and trimming rubber heels, operating industrial trucks, making gas masks, operating refining and straining machines in reclaiming rubber, running rubber-washing machines, splicing and trimming tire tread bands, separating rubber sheets that become stuck together in the long voyage from the crude rubber plantations, and making tubes.

It is interesting to note that since the close of the school year there has been quite a decided influx of school teachers. Many of these teachers have been prompted to seek work in the factory by a desire to perform a patriotic duty at this particular time. Others are influenced undoubtedly by the fact that a high wage rate may be earned.

It has been found that the work of the women is done as efficiently as it was by men. There are, however, certain operations which they are unable to perform. For example, they work on tire finishing with the men, but they have been found physically unable to carry the heavy metal cores on which the tires are built. This part of the work is therefore still done by men, and the women's rate of pay in this department is determined by the portion of the work which they actually perform. In cases where they work independently of other help they are paid the same as men for the same work.

More than 4600 men have left the company since the beginning of the war to enter Federal service.

#### New York Closing Saturday Afternoons

NEW YORK, July 13—Following the affiliation of the Automobile Dealers' Assn. of New York City with the National Automobile Dealers' Assn., the dealers here have voted to close their establishments at 1 o'clock Saturdays, beginning to-day. The service stations generally have been closed Saturday afternoons, the shops working 48 hours a week on a plan which made a half holiday possible.

Following the meeting July 1, at which the New York dealers joined the N. A. D. A., eight new members have been received, the local membership now including practically the entire row.

## Tractor Show Lists Filling

### Twenty-six Makers of Tractors, 9 of Implements and 16 Accessories Signed Up

SALINA, KAN., July 12—The list of accessory and implement manufacturers who will exhibit at the National Tractor Demonstration July 29 to Aug. 3, is growing steadily larger. So far, 26 tractor, 9 implement and 16 accessory manufacturers have signed up. The list follows:

#### Tractors

Avery Co.	Peoria
Square Turn Tractor Co.	Chicago
Hart Parr Co.	Charles City
Holt Mfg. Co.	Peoria
Nilson Tractor Co.	Minneapolis
Moline Plow Co.	Moline
Dauch Mfg. Co.	Sandusky
Parrett Tractor Co.	Chicago
Russell Co.	Massillon
Gile Tractor & Engine Co.	Ludington
Advance Rumely Thresher Co.	La Porte
Aultman & Taylor Machine Co.	Mansfield
Rock Island Plow Co.	Rock Island
Gray Tractor Co.	Minneapolis
La Crosse Tractor Co.	La Crosse
Cleveland Tractor Co.	Cedar Rapids
Hession Tiller & Tractor Co.	Buffalo
Four Drive Tractor Co.	Big Rapids
Velle Motor Corp.	Moline
American Tractor Co.	Peoria
Lyons-Atlas Co.	Indianapolis
J. I. Case T. M. Co.	Racine
Emerson-Brantingham Co.	Rockford
Wallis Tractor Co.	Peoria
Frick Tractor Co.	Wainsboro
Waterloo Tractor Co.	Waterloo

#### Implements

P. & O. Plow Co.	Ancon
Oliver Chilled Plow Works.	South Bend
John Deere Plow Co.	Moline
Grand DeTour Plow Co.	Dixon
Vulcan Plow Co.	Evansville
South Bend Chilled Plow Co.	South Bend
Turner Mfg. Co.	Port Washington
La Crosse Plow.	La Crosse
I. H. C. Co.	Chicago

#### Accessories

McQuay-Norris Mfg. Co.	St. Louis
Hyatt Roller Bearing Co.	Chicago
Timken Roller Bearing Co.	Canton
Diamond Chain Co.	Indianapolis
Am. Manganes Steel Co.	Chicago
Buda Motor Co.	Harvey
Sumpter Electric Co.	Chicago
Bosch Magneto Co.	New York
K-W Ignition Co.	Cleveland
Modine Radiator Co.	Racine
Hooen Radiator Co.	Chicago
Vacuum Oil Co.	New York
Gurney Ball Bearing Co.	Jamestown
Automotive Parts Co.	Indianapolis
S. K. F. Ball Bearing Co.	Hartford
R. D. Nuttall Co.	Chicago

#### Walnut Needed For Propellers

WASHINGTON, July 16—American walnut is needed for airplane propellers. The Bureau of Aircraft Production has said that years of test in the present war has proved that walnut is the best material for propeller manufacture and is soliciting mills and individuals to increase the Government walnut supply.

The Government does not buy walnut directly. Mills holding Government contracts for propellers purchase the walnut trees and logs and the Government is urging the owners of these trees and logs to sell them to the saw mills. Owing to

their inability to purchase sufficient walnut logs, the saw mill proprietors have not been able to supply the present requirements of the Allies.

"Fight with your walnut trees" is the slogan used in the publicity campaign of the Hardwood Section of the Bureau of Aircraft Production. It is pointed out that 6 walnut trees will provide lumber for a propeller and supply gun stocks for a platoon of infantry.

Any one with walnut trees 12 in. or more in diameter can learn where to sell them by addressing the Hardwood Section, Bureau of Aircraft Production, or the Production Division, Small Arms Section, Ordnance Department.

#### Purchasing Control System Planned

WASHINGTON, July 17—A system of control designed to protect the Government in the procurement of all war materials will soon be operated by the Department of Justice in conjunction with the War Department. A board of control will be appointed which will review every contract. Centralization of purchases of each commodity under a single bureau will be arranged in a manner similar to the present plan whereby all motor trucks are purchased by the Motor Transport Service. Contract clauses will be standardized. A daily fiscal survey of Government requirements will be made both for the information of the War Department and the public.

#### To Prevent Resale of Steel

WASHINGTON, July 17—Certain manufacturers on the preference list for steel supply, are reselling steel that has been delivered to them as a result of Government priority assistance, according to the War Industries Board. To prevent such abuses of the priority privilege the Board passed a resolution yesterday that if any such resales made hereafter without the approval of the director of steel supply of the War Industries Board, the manufacturer who is responsible for these resales will be dropped from the preference list and receive no further priority assistance.

#### Air Mail Expansion Planned

WASHINGTON, July 17—Rapid expansion of the air mail service with eventual country-wide scope will begin August 1, when the air mail service will pass from the War Department to exclusive post office control. College Park Aviation Field, 8 miles from Washington, has been selected as the new Washington terminal. Motorcycle delivery will be made from that point to the city. Army aviators returning from the war will have the preference in this service.

The first flight under the new system will begin August 1 when it is possible that another reduction in service charges from 6 cents per ounce to 3 cents per ounce with the usual 10-cent special delivery charge will be announced.

It is also planned to shortly inaugurate and 8 hour aerial mail route from Chicago to the East.

## South Africa Cars Sent from U. S.

### More than Half of All Imported Vehicles and Parts Come from America

JOHANNESBURG, SOUTH AFRICA, June 21—In the annual customs returns of South African imports for 1917, the value of cars, trucks, parts, motor cycles, tires and gasoline totals \$10,237,970 as compared with \$8,830,040 in 1916, or an increase of 25 per cent. Of the 1917 amount, \$4,500,000 was sent by the United States.

Under the head Motor Imports, South Africa includes not only cars, trucks, motor cycles and parts, but also tires and motor fuel. Of the total amount of passenger cars imported, 2596 valued at \$2,063,125 came from the United States in 1917 as compared with \$2,790,970 in 1916. The value of trucks likewise decreased from \$125,180 in 1916 to \$33,640 in 1917. The only item imported from the United States which increased in value in 1917 was motor fuel, including benzine and naphtha. In 1917, 4,589,896 gallons at a cost of \$1,383,770 were imported as compared with 3,204,474 gallons valued at \$893,360 in 1916.

#### U. S. Leads Exports

Despite the reduced amount of imports from the United States last year, in each case that amount was larger than shipments from all other countries combined, or more than 50 per cent of the total.

Passenger car shipments from Canada came second to those of the United States, having a value of \$960,000. Imports from all other countries besides Canada amounted to only \$21,000, making the total value of passenger cars sent from all countries other than the United States \$981,000, or less than half those from the United States. The difference in trucks was even greater, proportionally. United States imports were \$682,320 as compared with all other imports of \$3,480. In the matter of chassis, the United States and Canada sent approximately the same amount.

#### Imports Into South Africa of Cars, Trucks and Parts.

	1917	1916
<b>Passenger Cars.</b>		
United States.....	\$2,063,125	\$3,847,705
All other countries..	981,885	1,156,735
	<b>\$3,045,010</b>	<b>\$6,004,430</b>

	<b>\$111,927</b>	

Grand total.....\$3,194,057 \$4,002,130  
\*1916 amount included with car and truck import figures.

## Michigan to Have Rural Express

Lines to Run from Lansing to Grand Rapids—Another Line to Center in Flint

LANSING, July 15—In co-operation with the Federal Government to relieve railroad freight congestion and the State efforts to bring about the organization of rural motor express lines and return load bureaus, preparations have been made for the operation of such a line between Lansing and Grand Rapids. One Lansing company which owns several large motor trucks has informed Secretary Wickham of the Michigan Highways Transport Committee that its trucks will be available.

The plan of the Rural Express, which has been adopted in several States, is to organize routes for trucks between the principal cities and towns of the State. While the State will not be financially interested in the proposition, the committee appointed by the governor will assist in picking out the route, interest owners of trucks in the proposition and help the various Chambers of Commerce in organizing the Return Load Bureaus. The owner of a truck in the Rural Express system picks up the farm produce along his route, and in some instances he buys outright from the farm and sells the produce in the city. In other cases he receives a certain rate for transporting it to its destination. At the same time he takes orders for such goods as the farmer needs in town and delivers them to the farmer on his return trip.

Where the rural motor express companies do the transportation work for the big manufacturers between cities, the Return Load Bureaus have an opportunity to co-operate. For instance, if a truck should leave Lansing with a consignment for Grand Rapids, the Return Load Bureau in that city would be expected to get in communication with the manufacturers of that city and provide a load for the truck on its return trip.

### Truck Freight Line Centers in Flint

Plans have already been perfected by the traffic department of the Flint Board of Commerce whereby this city will become the center of a large transportation organization providing truck freight service for all of this section of the State. The first trucks to start out loaded in this new system left Detroit yesterday and will return with freight for Detroit to-morrow. Early next week freight service will start between Flint, Saginaw, Bay City and Alma, and at the same time truck service will start between Flint and Owosso, and Flint and Lansing.

Four trucking companies have been brought together in this new system which will practically work as one unit, with an interchange of freight service, so that through shipments may be made from any point to another. The towns

to be served include Ann Arbor and intermediate points between that city and Pontiac, where transfers will be made on the Detroit-Flint line, Holley, Fenton, Linden, Mt. Morris, Clio, Birch Run, Saginaw, Bridgeport, Frankenmuth, Bay City, Alma, Owosso, Corunna, Lansing, Fowlerville, Durand and smaller towns.

### More Rural Express Lines Started

NEW YORK, July 17—The National Automobile Chamber of Commerce is continuing to carry out its plan of urging and assisting in the establishment of rural express lines, and in harmony with this work, companies are steadily being established for this purpose. In Omaha, the Ford Livery Co. has purchased 3 trucks to act as forerunners to a fleet of between forty and sixty. These will be put in operation shortly, and haul freight both in and out of Omaha.

A corporation has been formed in Mason City, Iowa, which will purchase trucks and operate them on routes leading out of the city. The towns to be covered have a population of 89,900, and there are 1876 farms on the routes as well as 5628 within a mile of them.

In Chattanooga, Tenn., the Glaser Hauling Engineering Co. has opened a terminal and will run trucks to Knoxville, Atlanta, Birmingham, Memphis, Nashville and other cities.

A transportation club was formed in Elizabeth, N. J., last week, and already 32 tons of merchandise have been hauled between there and Philadelphia. A Return Loads Bureau has been established in connection with the rural express line.

## More Cars Are Sent Via New York

Nearly Half of All Automotive Exports of United States Go Through Metropolis

NEW YORK, July 17—The proportion of automobiles, trucks and parts shipped from the port of New York to the total automotive exports from the United States is again increasing. It was 43 per cent in May as compared with only 24 per cent in April, an increase of almost 100 per cent. The percentage, however, is still below normal, comparing unfavorably with a proportion of 46 per cent in March, 61 per cent in February and 71 per cent in January.

Automobiles, trucks and parts shipped from New York in May totalled \$3,339,558 as against \$2,396,448 in April. May exports as a whole were 22 per cent less than those for April.

The total value of passenger cars shipped from New York was \$1,289,109; that of trucks \$1,280,606, and parts \$769,843. The proportion of parts continues to increase steadily, being 9 per cent greater in May than April, which was the record until that time.

The largest individual shipment was one of 100 trucks valued at \$382,899, to Scotland. A shipment of 110 trucks valued at \$355,301 to France followed.

France also received the greatest number of passenger cars.

## Ford Buys Factory Site for Tractor Assembling Plant

DEARBORN, MICH., July 15—Henry Ford & Son has bought a large water power site in Hamilton, Ohio, where the company will erect a plant for the assembling of Fordson tractors. Construction will start in 30 days. It is expected the company will be in production within 90 days. A similar site has been purchased in New England, the exact location of which has not been announced.

With the acceptance of an additional order from Illinois for 3000 Fordson tractors, the production of the Dearborn plant is entirely sold out for the next year. Orders on the books of the company aggregate 50,000 tractors and no further orders are being accepted. Production is steadily increasing and before the end of the month a daily output of 150 tractors will have been reached.

Instead of having branches, the company intends to establish tractor plants all over the country. The Ohio and New England plants will assist in supplying some of the 50,000 tractors now on order.

Foreign shipments are being made to Peru, Japan, Africa, Fiji Islands, Sumatra, Java, Ceylon and the Philippines. The company is experimenting with packing for foreign shipments, and striving to reduce the cubical contents of its cases with the least amount of disassembling of its tractor.

### Ford Chaser Plant at Kearny, N. J.

WASHINGTON, July 15—Henry Ford will build a large plant at Kearny, N. J., for the manufacture of submarine chasers for the Navy. It is said that this will be the largest plant of its kind in the world. The first of the Ford chasers being completed at Detroit will be delivered next month.

### New Plant for Master Trucks

CHICAGO, July 15—Work will start shortly on the new plant of Master Trucks, Inc. A large tract of land has been purchased and details of construction are being worked out now. The company is making two trucks and a tractor, the bulk of the business, however, being on the 2-ton chassis.

### Overland Plant in Walkerville

DETROIT, July 16—Willys-Overland, Inc., will establish a branch manufacturing plant in Walkerville, Ont. It has signed a 3-year lease for the buildings recently occupied by the Gramm Motor Co. and will begin operations some time in August.

### American Motor Truck Sold

DETROIT, July 16—The American Motor Truck Co. was sold at auction June 27 by the Detroit Trust Co., receivers for the company, for approximately \$32,000. The personal property was sold in divided lots for \$22,000. The real estate, represented by an equity in a contract, was bought by Frank Bros. for \$10,000.

## Current News of Factories

*Notes of New Plants—Old Ones Enlarged*

The purchaser will assume payments on the unpaid balance. The entire contract is worth \$35,000 on which \$17,000 has been paid. The book liabilities of the company total \$50,000. This does not include the unliquidated claims. After these are filed it is believed the total will reach much in excess of \$75,000. The defunct company had been in operation only a short period—about a year or so—and it is said that only ten trucks were built during that time.

### Employees Insured by Page Steel

ADRIAN, MICH., July 17—The Page Steel & Wire Co. has perfected arrangements whereby every employee who has been in the service of the company for 3 months is insured to the amount of \$500, payable at his death to whomsoever he may direct the policy to be issued. The entire expense of the policy is paid by the company. The insurance will apply to the employees in the Adrian plant and also in the Detroit, Chicago and Monessen factories.

### Clubhouse for Falls Employees

MILWAUKEE, July 15—The Falls Motors Corp., Sheboygan Falls, Wis., has turned over to its 500 or more employees a clubhouse for their exclusive use and benefit. The club is provided at the expense of the company for entertainment and to promote educational, literary, musical and athletic activities. The club contains a library and reading room, pool and billiard hall, an auditorium for dancing and theatricals, and several smaller rooms for conferences and group meetings. The basement is provided with bowling alleys and gymnastic apparatus. Tuesday evening has been set aside for the exclusive use of the facilities by the female employees and their guests.

### Free Movies for Rubber Workers

AKRON, OHIO, July 16—As an extension of its welfare work, The Goodyear Tire & Rubber Co. is giving free outdoor moving picture shows for the benefit of its employees. The company's athletic field is used for the purpose, and pictures are shown there twice each week. The subjects shown are the popular comics, war films, good dramas, and a weekly pictorial review of Goodyear activities.

### A. Nelson Mfg. Co. Moves

CHICAGO, July 12—The A. Nelson Mfg. Co. has moved to its new building at 2662 Southport Avenue.

## Chandler Awards Contracts for Two Tractor Buildings

CLEVELAND, July 13—The Chandler Motor Car Co. has awarded contracts for the erection of two more tractor buildings and the enlargement of its two office buildings here. The work will be completed as soon as possible.

### Bearing Plant Output to be Doubled

TOLEDO, July 13—The Bock Bearing Co. soon will complete plans for extensions to its plant. It is expected that the capacity will be doubled by early winter, and that by 1921 it will be increased at least five times. The company now employs 800, and by winter this number will be increased to 1,000. The enlargement is due to the government's recent specifications of Bock bearings for all army trucks and automobiles. The company is a subsidiary of the Standard Parts Co., Cleveland.

### Gary Motor Truck Expands

GARY, IND., July 17—The Gary Motor Truck Co. has increased its capital from \$175,000 to \$1,000,000, and has perfected plans for the erection of an addition to its plant which will increase production from the present rate of 500 vehicles a year to 1500. The financial reorganization does not entail any change in management or policy.

### Republic Establishes Baltimore Branch

BALTIMORE, July 15—The Republic Motor Truck Co., Alma, Mich., has opened a factory branch here and taken over the business of Habersham-Miller, Inc. L. Van Bunkirk, formerly of the Studebaker Corp., is president of the reorganized company, which will retain its former style. Herbert L. Charlack is vice-president and A. J. Kenny secretary-treasurer. They have all been associated with the Republic organization for some time.

### Metal Auto Parts Organized

DES MOINES, July 17—The Metal Auto Parts Co. has been organized here to manufacture accessories for cars. Jack Messenger has been elected president; T. A. Tooey, vice-president; E. M. Messenger, secretary, and C. A. Messenger, treasurer.

### Sandusky Tire Breaks Ground for Plant

SANDUSKY, OHIO, July 12—Ground was broken to-day for the plant of the recently organized Sandusky Tire & Rubber Co. This will be completed within 6 months, and approximately 200 men will be employed.

### Comet in New Plant

DECATUR, ILL., July 15—The Comet Automobile Co. has moved into its newly constructed plant at William Street and Broadway. The construction of cars and trucks is being rushed.

## Dent Parrett a Captain in the Ordnance Department

CHICAGO, July 16—Dent Parrett, president of the Parrett Tractor Co. has been commissioned a captain in the Ordnance Department. He will work in Peoria on the co-ordination of engineering, production and inspection in the factories of the middle west that are building tractors for the Ordnance Department. The directors of the Parrett company were unanimous in permitting Captain Parrett to retain the presidency of the company, and accept his commission in the service.

Capt. Lawrence H. Earle, on duty for the past year as government inspector at the Holt Works, East Peoria, Ill., has been transferred to Washington as supervisor of tractors and tanks in the Ordnance Department. He has been succeeded in East Peoria by Capt. T. A. Collins.

H. S. Johnson, western district representative for the automobile equipment department of the Westinghouse Electric & Mfg. Co., has resigned and has become associated with the Ansted interests, manufacturing the Lexington car and the Teeter engine. He will be located at the plant of the Teeter-Hartley Motor Co., Hagerstown, Md.

E. W. Beach, president of the Manufacturers' Foundry Co., Waterbury, Conn., and a member of the board of directors and executive committee of the Motor and Accessory Manufacturers' Assn., has been appointed to a position in the inspection department of the Bureau of Aircraft Production. The work will take his entire time.

J. E. Allen, for several years manager of the Chicago branch of the Braender Tire & Rubber Co., has been made sales manager. He will make his headquarters at the factory in Rutherford, N. J.

J. B. Wyckoff, who was advertising manager for the Colt-Stratton Co., New York, Dodge Brothers distributor, has resigned. He has been appointed assistant business manager of The Nation's Business, Washington, and will take up his new duties Aug. 1.

F. A. Mansfield, for the last 12 years associated with the export and industrial departments of the Westinghouse Electric & Mfg. Co., has resigned to become manager of the Pittsburgh office of the Mechanical Appliances Co., manufacturer of motors and generators.

J. H. Amory has succeeded A. G. Thomson in the automobile lubrication sales division of the Joseph Dixon Crucible Co., Jersey City.

Edgar H. Dowson, vice president of the White Motors Co., White and Buick distributor in New Haven, Conn., has been appointed first lieutenant in the

## Men of the Industry

### *Changes in Personnel and Position*

Quartermaster Corps. He is stationed at Camp Holabird, Baltimore, in command of the Watertank division of a motor train.

J. M. Griffin has been appointed sales manager of the Kerosene Equipment Co., Detroit. He was formerly with the General Electric Co., Schenectady, N. Y., and later with Holley Bros., Detroit.

J. F. Cast, of the Firestone Tire & Rubber Co., Akron, has been promoted to assistant manufacturers' sales manager, a new position made necessary by the growth of this department. He has been with the company as salesman, branch manager and special representative since 1910.

C. P. Henderson, for the last 8 years general sales manager of the Cole Motor Car Co., Indianapolis, has resigned to assume the management of the company's western sales. J. E. Roberts, formerly western district manager has been promoted to general sales manager.

H. R. Hyman, for several years advertising manager of the Cole Motor Car Co., Indianapolis, has been appointed promotion department manager to succeed J. D. Riker who has resigned. Mr. Hyman will continue his duties as advertising manager in addition to the new work.

L. T. Miller, formerly assistant purchasing agent of the Detroit Steel Products Co., has been appointed purchasing agent for the Elgin Motor Car Corp., succeeding F. X. Devlin, resigned.

H. S. Ketcham, sales manager of the manufacturer's division of the Bradfield Co., has resigned. He has been appointed New England zone manager of the Cleveland Tractor Co., with headquarters in Boston.

E. D. Rogers has been appointed district sales manager of the Beck-Hawkeye Motor Truck Co., Cedar Rapids, Iowa, for the states of Texas, Oklahoma, Arkansas and Louisiana.

Harry J. Warner, former vice-president of the Continental Motor Co., has associated himself with the organization of the Federal Truck Co. He will act as vice-president in charge of production.

Fenn H. Fossick, assistant advertising manager of the Nash Motor Co., has resigned. He will take up special work in connection with the motor equipment section of the Ordnance Department.

## H. W. Davis Made President of Emil Grossman Mfg. Co.

NEW YORK, July 15—Changes have been made in the management of the Emil Grossman Mfg. Co., Brooklyn. H. W. Davis, who is vice-president of the Finance & Trading Corp., 43 Exchange Place, has succeeded Emil Grossman as president; K. P. Collins, who is also connected with the Finance & Trading Corp., has been made vice-president succeeding L. M. Schwarz.

Fred Berger, formerly chief engineer of the Oakland Motor Car Co., Pontiac, and sales manager of the Muir Carburetor Co., and later chief engineer of the Abbott Motor Corp., Cleveland, has been appointed chief engineer of the Gray Motors Co., Detroit.

E. W. Hurd has been advanced from assistant sales manager of the Premier Motor Corp., Indianapolis, to director of sales. The promotion was made following the death of P. D. Stubbs, the former director of sales.

H. E. Mahaffey, who has been acting as assistant manager of the branch of the Oakland Motor Car Co., in Cleveland, has been transferred to the Omaha branch, where he will serve in a similar capacity. Before joining the Oakland company, he was general sales manager of the Gray Tractor Co., Minneapolis.

Blaine McGrath has succeeded Hi Sibley an advertising manager of the Republic Motor Truck Co., Alma, Mich.

H. G. MacEachen, formerly western division manager of the Firestone Tire & Rubber Co., Akron, has joined the Veterinary Department of the United States Army.

J. Walter Drake, president of the Hupp Motor Car Corp., Detroit, has been appointed chairman of the Wayne County War Board, succeeding A. A. Templeton.

### Columbus Tractor Adds to Personnel

COLUMBUS, OHIO, July 14—The Columbus Tractor Co. has made several additions to its personnel. E. B. Moon has been appointed director of sales and advertising; Gebhard Jaeger, manufacturer of concrete mixers, will be production manager and general superintendent. Frank H. Nagle, formerly general manager of the Toledo Stove & Range Co., has been appointed assistant secretary and treasurer, in charge of purchasing and accounting, and Walter A. Jones, president of the United States Window Glass Co. and vice-president of the Columbus Chamber of Commerce, will be chairman of the board of directors.

### Dr. Edgar Marburg Dies

PHILADELPHIA, July 15—Dr. Edgar Marburg, secretary-treasurer of the American Society for Testing Materials since its incorporation in 1902, died recently.

# Industrial Review of the Week

## A Summary of Major Developments in Other Fields

### Margin of Steel Output and Requirements Narrowed

Washington has given no sign that ordinary consumers of steel will get larger allowances under the War Board's recent statement. Later checking of figures furnished by the Government and its Allies really narrows the margin between probable output in the second half of the year and the requirements for war. Leading steel manufacturers up to this week have taken the view that the situation would be easier in a few months. They are less confident of that now.

Actual procedure under the new classification of orders is not far from what has been followed. Some producers are even more exacting than before, now that they are asked by the Government to decide as to precedence in shipment.

It now appears certain that open-hearth steel output of the country will be practically taken up by war and essential needs for the remainder of the year and that whatever permits are given for general or class D purposes must be filled almost entirely with Bessemer steel.

The plate mills keep on producing at a yearly rate of 6,000,000 tons, a recent week showing 114,000 tons, while new capacity may bring the rate up to 7,000,000 tons a year by January.

Data are being gathered on which a question may be raised with the British Mission as to the nature and extent of British exports of steel. The Canadian steel trade is involved in a measure also. Some Canadian steel has been sold in New England at high prices, to a non-essential industry, yet large shipments of American steel are being made to Canada at control prices. An amicable exchange on the whole question is possible, in view of the considerable amounts of American steel for which Great Britain has asked. Interesting in the same connection are recent reports of easier conditions as to steel supply in the Birmingham and Sheffield districts of England.

Jobbers are finding that they cannot replace their stocks except in so far as these went to fill war needs, and few warehouses are likely to get back to more than 50 per cent of normal tonnage.—*Iron Age*.

### Detroit Plane to Make Flight

DETROIT, July 17—The first battle plane built entirely in Michigan will be flown to-morrow. According to arrangements the plane will fly from Detroit to Flint, leaving Detroit at 10.30 a. m. and landing at its destination at 11.30. Flint is 68 miles from Detroit. The plane will be piloted by Lieut. Lewis and a member of the Aviation Corps will be in the bomber's seat. The ma-

chine is the De Havilland fighting and bombing type, equipped with a Liberty engine. The body was constructed entirely at the plant of the Fisher Body Corp. Arriving at Flint, it is planned to have Lieut. Lewis give an aerial demonstration of fighting tactics before 12,000 employees of the Buick Motor Co.

### Ford & Son Shares to Be \$100

DEARBORN, MICH., July 16—At a meeting of the holders of the capital stock of Henry Ford & Son, according to an application made for an increase in the capital stock from \$1,000,000 to \$5,000,000, it was decided to divide the stock into 50,000 shares of \$100 each. The document states that \$4,000,000 has already been subscribed and \$1,000,000 paid in cash.

### Saxon Moves Service Department

DETROIT, July 16—So that work can be handled more efficiently, the service department of the Saxon Motor Car Corp. has moved its quarters to the main plant.

### United Motors Service Expands

NEW YORK, July 12—The United Motors Service, Inc., which operates 6 branches and 15 service stations in various cities, has taken over all of the field service work of the manufacturers of Delco, Remy and Klaxon electrical equipment. The general offices of the company have been moved to larger quarters at 782 Woodward Avenue, Detroit.

### Cassidy to Market Fuel Economizer

NEW YORK, July 15—The Edward A. Cassidy Co., which has built up a distributing business in several automotive products, has added a gasoline economizer. The product is Eccolene, which is made by the Eccolene Co., Detroit. This is made of seven oils and is added to gasoline in the ratio of one or two oz. of the product to 5 gals. of gasoline, depending on the size of the engine.

### Lipsner to Superintend Aerial Mail

WASHINGTON, July 16—Captain B. B. Lipsner of Chicago, has resigned his commission in the Army to become superintendent of the United States Aerial Mail Service. The position given Captain Lipsner is in anticipation of the ultimate taking over of the service by the Post Office Department with its own equipment and personnel. The equipment and personnel used at present has been loaned to the Post Office Department by the War Department.

The new 16-cent rate, announced earlier, went into effect yesterday. The rate is 16 cents for the first ounce including special delivery service, and 6 cents for each additional ounce.

### Wilson Satisfied with Copper Price Agreement

WASHINGTON, July 15—The President has approved the agreement that the maximum price on copper shall be 26 cents a pound, taking effect immediately and subject to revision after Aug. 15. This is an advance of 2½ cents over the former price of 23½ cents. The new price is f.o.b. cars or lighters at the refinery if shipped from eastern refineries, and f.o.b. New York if shipped from western refineries, subject to the additional charges on copper shapes announced early in June.

June production of refined copper, including electrolytic, lake and casting, is estimated at 210,000,000 lbs., as compared with 220,000,000 lbs. in May. Total output for the 6 months ended June 30, 1918, is estimated at 1,220,000,000 lbs., as compared with 1,270,000,000 lbs. for the corresponding period of 1917.

The estimates of the number of pounds of copper production compare as follows:

	1918	1917
January .....	175,000,000	183,000,000
February .....	185,000,000	198,000,000
March .....	215,000,000	225,000,000
April .....	215,000,000	211,000,000
May .....	220,000,000	223,000,000
June .....	210,000,000	230,000,000

### Holmes Forming Truck Company

MT. PLEASANT, MICH., July 15—Milton A. Holmes, for 4 years sales manager and for 2 years vice-president of the Republic Motor Truck Co., Alma, Mich., is at the head of the Transport Truck Co., a \$1,000,000 organization which is being formed here. A committee was appointed to investigate Mr. Holmes' proposition. On the strength of this report a stock subscription drive is going on in Isabella County so that the company's operations can start about Oct. 1. Plans call for two buildings, each 700 x 80 ft. The size of the truck to be manufactured has not been officially announced.

### Four Makers Change Prices

NEW YORK, July 17—Following are changes in price which have been made during the past week:

Car	Old Price	New Price
Glide, light six-forty.....	\$1,495	\$1,595
Templar, five-passenger..	2,085	2,185
*Haynes, model 39.....		1,900
Olympia .....	1,085	1,240

\*New model.

### Aviation Expert Here

WASHINGTON, July 14—Lieutenant-Colonel Sir Henry Fowler, in charge of the Sectional Components of Aircraft, and Assistant Director General of Aircraft Production of the British Ministry of Munitions, has arrived in this country on a special mission concerning airplanes.

## Army Truck Contracts Awarded

WASHINGTON, July 14—Awards for parts for the new series model B 3-ton standard Army motor trucks have been made as follows:

June 21, 1918.

The Vichek Tool Co., Cleveland; sets tool bag equipment.

Fairmount Tool & Forging Co., Cleveland; sets tool-bag equipment.

The Hinkley Motors Corp., Detroit; motors.

June 27, 1918.

American Brass & Iron Works, Detroit; gasoline feed pipe shut-off cocks.

Duff Mfg. Co., Pittsburgh; jacks.

Templeton Kenly Co., Chicago; jacks.

June 28, 1918.

Kales Stamping Co., Detroit; gasoline feed pipe clips.

The Hayes Mfg. Co., Detroit; air cleaner assemblies, air cleaner clamp assemblies.

General Motors Co., Flint; transmission front hangers.

Sterling Motor Truck Co., Milwaukee; pedal pads.

Peters Machine Co., Cleveland; universal joints.

June 29, 1918.

Perry-Fay Co., Elyria, Ohio, rear axle worm shaft thrust bearing cover stud, rear axle worm shaft thrust bearing retaining nut, rear axle worm shaft radial bearing lock nut, differential carrier to rear axle housing stud, rear axle worm shaft thrust bearing cover and stud nut, rear axle worm shaft radial bearing cover screw, differential carrier to rear axle housing stud nut, rear axle worm shaft nut, rear axle worm shaft radial bearing spacer (narrow), rear axle worm shaft radial bearing spacer (wide), rear axle worm shaft thrust bearing retaining nut washer, rear axle worm shaft thrust bearing sleeve, rear axle worm shaft thrust bearing spacer.

Globe Machine & Stamping Co., Cleveland; rear axle worm shaft oil thrower (front), rear axle worm shaft oil thrower (rear), rear axle worm shaft thrust bearing retainer nut lock, rear axle worm shaft radial bearing lock nut lock.

National Malleable Castings Co., Toledo; malleable iron castings, No. 1909-Y, rear axle differential carrier; malleable iron castings, No. 1906-W, rear axle worm shaft radial bearing cover; malleable iron castings, No. 1911-V, rear axle worm shaft thrust bearing cover; metal pattern equipment for No. 1909-Y, rear axle differential carrier; aluminum vibrator plate pattern for No. 1911-V, rear axle worm shaft thrust bearing cover; aluminum vibrator plate pattern for No. 1906-W, rear axle worm shaft radial bearing cover.

Cleveland Worm Gear Co., Cleveland; No. 1910-Y, axle worm shaft.

Lincoln Brass Works, Detroit; gasoline shut-off cocks.

United States Ball Bearing Mfg. Co., Chi-

cago; radial bearings complete with bronze retainer; special thrust bearings, complete with bronze retainer.

The Prudden Wheel Co., Lansing; sets wheels.

Breeze Mfg. Co., Newark, N. J.; pieces air cleaner to carburetor tube, with paper packing.

July 3, 1918.

Garlock Packing Co., Cleveland; rear axle worm shaft radial bearing cover gaskets.

Hayes Mfg. Co., Detroit; body seat assemblies.

C. R. Wilson Body Corp., Detroit; body seat assemblies.

Orem Motor Protector Co., Baltimore; air cleaner assemblies.

## Quartermaster Awards

WASHINGTON, July 12—The Motor Transport Service of the Quartermaster Department has awarded contracts to the following companies:

Nash Motors Co., Kenosha, Wis.

Grant Motor Car Corp., Cleveland.

Moon Motor Car Co., St. Louis.

Cleveland Tractor Co., Cleveland.

## Ordnance Contracts Placed

WASHINGTON, July 12—Following are the firms with whom purchase orders and contracts were recently placed by the Ordnance Department:

Pyrene Mfg. Co., New York.

Empire Tire & Rubber Co., Trenton.

United States Tire Co., Washington.

Nash Motors Co., Kenosha, Wis.

The Stanley Works, New Britain, Conn.

The Four Wheel Drive Auto Co., Clintonville, Wis.

North & Judd Mfg. Co., New Britain, Conn.

Champion Spark Plug Co., Toledo.

Wilson Body Co., Detroit.

Militor Corp., Jersey City.

## Marine Contracts Placed

WASHINGTON, July 12—The following are contracts placed by the Marine Corps:

Studebaker Corp. of America, New York, trucks.

Ford Motor Co., Detroit, chassis.

Firestone Tire & Rubber Co., Philadelphia, tires.

The Goodyear Tire & Rubber Co., Akron, tires and tubes.

## Ask Bids for 5000 AA Trucks

WASHINGTON, July 15—Bids have been requested by the Motor Transport Service from automobile manufacturers on the AA  $\frac{3}{4}$ -ton army truck. Five thousand of these trucks will be purchased. Blueprints and specifications are on view in Washington at the office of the National Automobile Chamber of Commerce, and at the Motor Transport Service offices and in the Book Building in Detroit, Cleveland and Chicago. The AA truck is an adaptation of the General Motors Co. No. 16  $\frac{3}{4}$ -ton truck which has been adopted as previously announced in these columns.

Chicago Quartermaster Branch  
Discontinued

CHICAGO, ILL., July 17—The Quartermaster's Truck Purchasing Department of this city will shortly be given up and the entire work concentrated in Washington.

## Toledo Screw Gets Shell Order

TOLEDO, July 15—The Toledo Screw Products Co. has received another order for 1,000,000 1-lb. shells, complete, for the navy. The contract, with other government work on hand, will necessitate the erection of a \$50,000 machine shop, 150 x 32 ft., adjoining the present plant. Work on the addition is to begin immediately.

## Milwaukee Speeds War Work

MILWAUKEE, July 15—Wisconsin is one of the first states in the Union to perfect its industrial organization to speed up war work under the plan of regional districting recently adopted by the War Industries Board, Washington. August H. Vogel, regional director for District No. 17, embracing nearly all of Wisconsin, has divided the state into twenty districts, each of which has formed a sectional organization with a chairman and secretary. The most important of these is Section 16, comprising Milwaukee and Waukesha counties, of which Richard P. Tell, president and general manager, National Brake & Electric Co., Milwaukee, and head of the Milwaukee Metal Trades and Founders' Association, has been designated as chairman. The industrial bureau recently established at Washington by Milwaukee business men has been turned over to the regional director to serve the entire state.

## Calendar

## RACING

July 27 — Chicago. Chicago Speedway.  
Aug. 3 — Uniontown. Uniontown Speedway Assn.  
Aug. 10 — Providence, R. I.  
Aug. 17 — Sheephead Bay.  
Sept. 2 — Uniontown. Uniontown Speedway Assn.  
Sept. 7 — Chicago. Chicago Speedway.  
Sept. 21 — Sheephead Bay.  
Oct. 5 — Cincinnati. Cincinnati Speedway.

## SHOWS

July 27 — Syracuse, N. Y. Tractor Demonstration. New York State Food Commission.  
July 29-Aug. 4 — Salina, Kan. National Tractor Demonstration. Auspices of National Implement and Vehicle Assn.  
Aug. 6 — Fulton, N. Y. Tractor Demonstration. New York State Food Commission.

Sept. 2-7 — Indianapolis, Indiana. State Fair. Indianapolis Automobile Trade Assn.  
Sept. 14-21 — Chicago. Automotive and Accessories War Exposition. Municipal Pier.  
Oct. 14-27 — Dallas, Tex. Seventh Annual Texas Automobile Show. Texas State Fair.  
Oct. 16-18 — Ottawa, Ont., International Plowing Match, Tractor and Farm Machin-

ery Demonstration. Experimental Farm.

## ENGINEERING

Sept. 2 — Cripple Creek, Colo. American Institute of Mining Engineers.  
Nov. 14-15 — New York. Society of Naval Architects and Marine Engineers. Twenty-sixth general meeting. Engineering Societies Bldg., 29 West 39th Street.

*"Has it a Red Seal Continental Motor?"  
The Important Question.*

America's Standard  
Passenger Car Motor.  
Look for the Red Seal  
Nameplate.

America's Standard  
Truck Motor.  
Look for the Red Seal  
Nameplate.

When you buy an automobile or truck how can you be sure of the motor—sure of its power, its economy, its speed, its silence, its durability?

The most convincing evidence of what a motor will do, is the record of what it has done. Past performance is the surest evidence of motor worth.

When you buy a Continental Red Seal Motor you buy a motor proved by performance—a motor embodying nothing untried, nothing experimental.

A motor conceived not over night, but the sure result of fifteen years of patient endeavor—by an organization which is to-day the largest exclusive motor manufacturing concern in the world.

A motor endorsed not alone by its makers, but by over 160 manufacturers who use it in the automobiles and trucks they make, and thus upon it stake an investment of millions of dollars.

Look for the Red Seal on the motor in the car or truck you buy. It's your guarantee of motor quality.

## Motor Truck's Essential Nature Presented to War Industries Board

Reasonable Steel Supply Assured—Trucks Sold Should Go Into  
Essential Uses—Makers Should Encourage Proper Use of  
Vehicles—Priorities Board Outlines Liberal Program

**W**ASHINGTON, D. C., July 20—The essential character of the motor truck in transportation, and the necessity for a continuation of the industry during the war, were placed before the Priority Committee of the War Industries Board yesterday, and as a result motor truck manufacturers are assured a supply of steel for the manufacture of trucks and parts both for war and industry.

It was shown that approximately 90 to 95 per cent of existing motor truck users are essential to transportation and industry. Eighty per cent of the truck users at present are using their vehicles directly or indirectly for war work, and most of the remaining 20 per cent are used in domestic uses.

The truck industry was represented by the National Motor Truck Committee, and the National Automobile Chamber of Commerce, George N. Graham, chairman of the Truck Committee, presenting the arguments for the truck, in which a written statement was submitted.

The Priority Committee, headed by Judge Edwin B. Parker, took a very favorable view of the truck situation, and while there is a serious need for steel for war, and while the government could use more steel than will be produced this year, the War Industries Board realizes that certain industries must be properly supplied, and Judge Parker agreed that

the motor truck industry is performing exceedingly valuable work and should be given the necessary steel even if such has to be taken from steel supplies needed for other war work, in order to allow it to increase its value as a transportation medium.

Summed up briefly, Judge Parker stated that steel would be assured to all truck manufacturers both for manufacture of repair and spare parts and for the manufacture of the trucks demanded by the yearly program on the condition that the truck makers will encourage proper use of trucks and will guarantee that all trucks sold will go to essential use. In consideration of the urgent Government demand for steel, and the fact that the steel for the truck industry will virtually come from the stocks designed for war purposes, the truck committee feels that the War Industries Board has displayed a comprehensive view of motor truck utility and has agreed to a broad and ample program for it.

Judge Parker stated that the necessary steel for motor trucks will be found providing the industry follows the three requests, which are:

1—Motor truck makers and agents use every facility for encouraging the widest possible proper use of trucks during the war.

2—Motor truck makers will comply with a list of essential truck users in making future sales.

The list of essential users is to be compiled by Mr. Graham and C. C. Hanch, Chief Automotive Section, War Industries Board, within the next 10 days and will later be checked and completed by the Priority Committee. It will contain at the outset every kind of truck user. Those not considered essential will be eliminated.

#### Written Presentation Sent

Motor truck makers and agents will work for the strictest conservation of those trucks now in the hands of consumers by urging their repair and maintenance so long as possible before replacement by new trucks. Owners and operators will be requested to repair and use the old trucks, operate them fully loaded and maintain shifts of drivers to secure the greatest use possible per day from each.

The written presentation sent to the Priority Committee recently follows in complete text. It tells of the shortage of steel now existing in all motor truck factories, of the utility of the truck as a method of transportation for both general and war work, of the Government recognition of the truck as a mode of transportation for war materials, food produce and general express work.

These are tabulated with the percentages. On Jan. 1, 1918, 400,000 trucks were used in this country, it is shown, with production indications for 1918 placed at 275,000 trucks of which 50,000 go to Europe for war work, 40,000 replace others worn out in this country, making a total of 185,000 to go into domestic use. This insures approximately 585,000 trucks in use in this country for 1919, and the committee estimated that these will individually average 10 tons haul per day or a total of 5,850,000 tons hauled daily by trucks. These figures impressed the Priority Committee.

#### Information Requested

Mr. Graham further explained at the hearing yesterday, which was attended by the Priority Committee, C. C. Hanch, and the truck committee, including George Graham, Pierce Arrow Motor Car Co., and chairman, Windsor T. White, White Co.; M. L. Pulcher, Federal Motor Truck Co.; David Ludlum, Autocar Co.; D. C. Fenner, International Motors Co., and S. A. Miles, National Automobile Chamber of Commerce, a number of other points important to the request for steel.

In reply to requests from the Priority Committee, made earlier this week, the truck committee telegraphed all truck makers for information as to:

a—How many completed and unsold trucks for domestic use each has on hand at the factory or in branches or agencies.

b—How many trucks each can build from material at present on hand.

c—For how many trucks each will require material to fill the domestic program for the remaining months of 1918.

d—How many trucks were produced by years for 1916, 1917 and the first 6 months of 1918 for the United States and the Allies.

e—How many trucks were produced for domestic purposes in the same period.

f—How much steel the aggregate number of trucks produced in that period required.

g—How much rubber the total number of trucks produced in that period used.

h—How much coal was needed per plant per year.

i—What war work other than truck manufacturing each plant was engaged in.

j—The passenger car business of each truck maker.

Inquiries for this information was sent to 144 firms and replies were classified into two series, those who made more than 100 trucks in the 2½-year period and those who made fewer than that number. It was found that 101 concerns made more than 100 trucks in the 2½ years. These manufactured 276,477 trucks between Jan. 1, 1916, and June 30, 1918, for all purposes, war and otherwise. Figures revealed show that 276,477 trucks required 492,129 tons of steel and 48,537 tons of rubber.

These figures give the average of 1.7 tons of steel and 200 lb. of rubber per truck.

#### 13,000 Trucks on Hand

Thirteen thousand trucks, 1 month's supply, are all that the manufacturers have on hand, either completed or which can be completed from the parts and material in stock. This small amount displayed to the Priority Board the need for prompt relief to the truck industry provided it found the industry worthy.

One of the most impressive statements by the truck committee was to the effect that elimination of trucks at this time would be seriously injurious to the railroads, war and every war requirement, which was backed up with a detailed account of the functions of the motor truck. The chairman not only told how important these functions are but went into detail telling that trucks are being used for road work, cantonment provisioning government, warehouses, government and war housing building, by steel firms, express companies, oil companies, army shoe makers, army clothing and wool makers, food product concerns like the meat packers, dairy companies, electrical equipment makers and for shells, government furniture, feeding cantonments, farm products producers, tobacco growers and packers, coal mines and so forth and created a climax by telling that 28 5-ton Mack trucks were purchased this week by the Bureau of Mines which will deliver every ton of coal this next season to be used by the many government buildings here. The chairman enumerated more than 200 companies dealing in the above commodities for war purposes that used thousands of the trucks, and it was through this complete accurate tabulation that the Priority Committee realized how important the motor truck was.

#### 900,000 Tons Hauled

The committee further told that 900,000 tons of war and other important merchandise is being hauled yearly between Philadelphia and New York by motor trucks, considerably augmenting the railroads and actually preventing serious railroad congestion. He described the Akron to Boston route used by the Goodyear company.

As far as can now be gathered the essential list of truck users will include a vast majority of existing consumers. Such concerns as department stores were mentioned and the Priority Committee taking a reasonable view, admitted that while some of the commodities purchased should be carried home, many others, such as furniture which is to a great extent an essential commodity, could not be carried and could best be handled by motor trucks. A truck consumer who is in some such business as jewelry and to some degree doing war work, can, if not on the essential list, arrange to purchase a truck demanded by his war work, by making application possibly to C. C. Hanch or to the Priority Committee as will be later arranged.

Following is the text of the written presentation sent to the Priority Committee by the truck committee:

# Need of Motor Truck Makers for Materials and Fuel

## Text of Presentation Before War Industries Board

"THIS presentation directs to the attention of the War Industries Board the imperative necessity of giving to motor truck manufacturers an advanced priority that will assure materials and fuel at once.

"Such action is urgently needed. Unless it comes immediately there will be an interval of months with virtually no production. This will have the direct result of delaying the war program.

"We believe that trucks used in this country are necessary to a swift winning of the war. On this basis alone we ask consideration.

"Careful analysis shows 101 motor truck manufacturers must between June 20, 1918, and Dec. 31, 1918, meet a demand for 103,961 trucks exclusive of those classed as war orders. They have completed, or have on hand materials for 13,044 trucks. This is a shade more than 12 per cent of the demand. The sales of one month will exhaust these 13,044 trucks.

"Some makers have no steel whatever.

"Steel and other metals must be found for the making of more trucks unless the nation's commerce and the war program are to be denied the transportation help the motor truck can give.

### Utility Is Sole Criterion

"The motor truck is solely a utility. In this presentation we ask to have it considered separately from the automobile passenger car, which also is a highly important transportation medium, but not used exclusively for business.

"The motor truck discharges no function of entertainment.

"It furnishes transportation at a time when transportation is a vital material need.

"It is conceded that during the war we must have production. The motor truck is inseparably related to distribution of this production.

"Congested traffic constitutes a war problem.

"Production cannot be brought up to its ultimate unless sources of communication are regular and rapid.

"Insufficient transportation did more to retard the rapid and efficient entrance of the United States into the war than could a legion of Huns.

"This was proved last winter when to get transportation for coal to send ships to Europe with urgently needed supplies, the Fuel Administration found it necessary to stop all production for 5 days.

"Present shortages of coal and steel result largely from transportation deficiencies.

"There are three main sources of transportation, as follows:

"a—Railway.

"b—Steamboat.

"c—Motor Truck.

"The enormous growth of business and the extraordinary volume of war haulage have virtually overwhelmed both railroad and steamboat facilities. Both have more freight than they can handle. Only transportation over the highways offers any considerable possibility of immediate relief.

### Trucks in War

"Almost all trucks serve their war purpose at this time. This applies equally to trucks that are going to the European battlefronts, and to those that will be used in this country.

"Many purveyors in war supplies have based their schedules of rapid delivery on the help of the motor truck.

"We can furnish your committee instances in which the truck has rendered a four-way service in this work. Such trucks haul away the dirt excavated for the foundations of a new building. Then they bring in material for constructing the building. Next they deliver raw material for making the product. Finally the truck completes its record of performance by carrying the finished articles to the point of delivery. Such trucks are just as valuable in handling war supplies as those used in France.

### Government Recognition

"The United States Government has recognized the importance of the truck both for military and so-called domestic uses.

"War Department Order No. 38 established the Motor Transport Service for war trucks. The Highways Transport Committee, serving as part of the National Council of Defense, was organized to divert all possible traffic to the highways.

"Government trucks running from cities in the middle west to the seacoast are constantly establishing the practicability of overland delivery by power vehicles.

"The Department of Agriculture has encouraged the application of trucks to the moving of food.

"The Fourth Assistant Post-Master General is hauling farm products into the big cities, distances of more than 100 miles by motor trucks. His program, presented in a bill now before Congress, calls for the eventual establishment of 5000 miles of new roads, which will be built from the profits of motor truck haulage of food to market.

"Every truck put into service brings the manufacturer nearer his market, brings the farmer nearer the consumer, brings the finished war order nearer the labor.

shipping point, facilitates rapid filling of orders, supplies the equivalent of manpower lost by withdrawal of soldiers, makes less serious the shortage of horses, and restores gaps in organizations occasioned by deficiencies of labor, material and transportation.

"The farmer, dependent as much on rapid access to his market as on the productivity of his farm, finds the motor truck coming to his aid at a time when he cannot hire farm hands. A truck on a farm will replace from two to four men. It will carry twice the load in half the time. It will make available for other production 5 acres of land whose yearly crop is now required to feed a horse.

"It has been estimated that in view of the greatly increased production of food stuffs, wheat, rye, barley, oats, corn, beef, pork, mutton, eggs, milk, poultry and fruit, that 2,000,000 trucks could profitably be used between farms and markets. Only 450,000 motor trucks are now available for all lines of business. This is only 25 per cent of what could be applied to farms alone.

"The use of the truck in so-called rural motor express lines offers the best possible medium through which farmers, truck growers and dairymen may get to their markets. The truck is also being used for the delivery of live stock to stock yards.

"Some makers sell 60 per cent of their trucks to farmers.

"Many trucks are carrying raw materials to factories. The absence of the service rendered by these trucks would often mean that thousands of men would go idle for lack of the raw material on which they work.

"Some railroads have had to decree that goods consigned in less than carload lots cannot be delivered in any specified time. This ruling results from a shortage of rolling stock and equipment, and a general congestion in freight yards, terminal points and warehouses.

"The facilities of express companies for general work have been very much limited through the necessity of using baggage and express cars in troop movement. Therefore the purveyor in food supplies has found himself hard pressed to get transportation. He is placing increasing dependence on the motor truck.

"The development of heavy haulage companies operating between big cities and sometimes covering as much as 150 miles in their regular routes, is a significant development. The use of trucks in this kind of work is increasing by leaps and bounds, for the truck is superior for short-haul work and in making stops en route. It can deliver supplies to the door of the consignee. It saves time and

"In many points it has been found necessary to place embargoes on movement by rail of certain kinds of freight within certain zones. The result has been to divert this haulage to local transportation and transfer companies, the medium in almost every case being a truck.

"All that has been gained by the application of these trucks will be lost if there is a shortage of trucks or of parts to keep present trucks in repair. There will be this shortage unless some immediate guarantee of material is given to the whole industry.

#### 80 Per Cent in War Work

"Our inquiries, based on a questionnaire sent to various manufacturers, show that about 80 per cent of the output of motor trucks is being used in war work or related war activities.

"By war work is meant motor trucks sold to the United States or its Allies, to the Red Cross, to the Y. M. C. A., or for use in cantonments, hospitals, government war buildings. In related war activities we include trucks used in the construction of ship building plants, used in industrial plants where war materials are being made, used by manufacturers or merchants in hauling army supplies, used for motor express lines, including parcel post service, by farmers as motor omnibus or stage lines, together with their application to a variety of other uses relating to the war.

"This leaves a comparatively small percentage of trucks applied to unrelated war activities. Even this small percentage involves a service of practical utility and convenience.

"In order to make this usefulness clear, we have analyzed the sales of a foremost motor truck manufacturer for the period of 12 months' business in the year 1917. The appended arrangement by percentages will show that virtually every activity therein represented has some relation to the war:

Transfer and transportation.....	13.27
Grocers .....	8.8
Contractors .....	7.6
Oil and gas producers.....	14.3
Coal dealers .....	4.7
Building supplies .....	5.0
Tool and machinery mfgs.....	2.0
Lumber .....	3.5
Meat packers .....	2.7
Chemical manufacturers .....	1.3
Textile manufacturers .....	1.7
Public utility .....	2.3

Hardware .....	9.8
Paper .....	9.8
Paints .....	8.8
Bakery .....	8.8
Flour .....	1.2
Sugar .....	8.3

"On Jan. 1, 1918, there were 400,000 trucks in the United States. It would be better for this country were the number five times as great.

"On the basis of the first 3 months production, there are indications that 275,000 trucks will be produced in 1918. Approxi-

mately 50,000 of these will go into war use in Europe; 40,000 will be used to replace trucks withdrawn by the law of wear and tear. This will mean not less than 185,000 trucks for domestic use.

"The smallest of these trucks has a capacity of 5 ton, the range progressing up to 10 tons with the aid of a trailer.

"The potential haulage capacity of the 450,000 trucks now in use can readily be understood. Allowing an average of 10 tons a day per truck, an estimate which is small since many trucks in short haul work will move as much as 100 tons per day, we have a total of 4,500,000 tons of freight moved per day. Surely there can be no arguments in favor of restricting such a valuable service.

"Any delay in obtaining motor truck materials will eliminate the manufacture of parts necessary to keep in repair trucks now in use.

"This constitutes a serious problem, for there is constant need of replacement

#### War Steel for Trucks

"We genuinely believe that the need for trucks and for repair parts is so great that steel and other materials should be found for them, even though it has to be taken from some other items classed as war necessities.

"It means little to get rapid motor truck movement of war supplies in Europe if similar rapid movement lack at home.

"A way should be found to make to the motor truck industry a definite allotment of a certain percentage of the steel in sight, even though it be necessary to curtail some other war programs. We believe there are others less immediately vital.

"This recommendation is made with the full knowledge of its seriousness. It is based solely on our belief that trucks are important to the winning of the war, that the whole system of transportation in this country will be further handicapped unless they are supplied.

"It is essential to make a prompt decision for the guidance of manufacturers.

"It is necessary in the construction of motor trucks to plan ahead. Even material delivered at once cannot be converted into trucks in less than 3 or 4 months.

"Under the present system nothing is definite. A manufacturer cannot lay out his program. He works out his requirement and places an order with the producer of steel. The latter declines to enter it on his books because he is prevented from so doing by regulations of the War Industries Board. Often 90 per cent of material may be available, but lack of the other 10 per cent delays production.

"Therefore, valuable time is lost. Transportation needs are constantly growing. Action should be taken so that the motor truck manufacturer may supply his share of that transportation.

"We cannot think it is the purpose of the War Industries Board to allow this condition to continue.

"It might be possible to work out an arrangement by which each motor truck manufacturer would be permitted during the next 12 months to produce a certain

number of trucks per month and to furnish replacement parts for trucks now in service. The allotment per month should be based on the sales of the last year.

"Each concern would report the amount of material necessary for its production allotment.

"Should the demand for any particular truck increase, this manufacturer could make application to be allowed to purchase an additional volume of material.

"In order to present necessary data we have requested motor truck manufacturers, not only those included in the membership of the N. A. C. C., but the unaffiliated as well, to answer these three questions:

"1—How many completed and unsold trucks for domestic use have you at your factory or in the hands of your branches and agencies?

"2—How many trucks can you build from the material at present on hand?

"3—For how many trucks will you need material to fill your domestic program for the remaining months of 1918?

Please note attached a record of the answers. These show that the stock of trucks on hand, or the material with which to build trucks, is virtually depleted.

#### Production Waits on Material

"By a study of the data you will find that nearly every manufacturer of motor trucks needs material. His stock in hand has been depleted by large purchases for war uses and related war uses.

"It has been our endeavor to make the presentation as brief as possible. If there is any further data you desire, we shall be glad to furnish it.

"The N. A. C. C. maintains in Washington a resident Motor Truck Committee composed as follows:

"George M. Graham (Chairman), Pierce-Arrow Motor Car Co.

"Windsor T. White, The White Co.

"N. L. Pulcher, Federal Motor Truck Co.

"David Ludlum, The Autocar Co.

"D. C. Fenner, International Motors Co.

"S. A. Miles, Natl. Automobile Chamber of Commerce.

"It is possible that the Priorities Section of the War Industries Board might deem it advisable to grant a hearing to this Committee or to the industry as a whole, in order that the facts above presented might be furnished in more detail and that there might be an interchange of views.

"The National Motor Truck Committee is representative, since it speaks for the 55 principal manufacturers of motor trucks included in the membership of the N. A. C. C., as well as for many other companies not affiliated, but with whom it works in harmony and whose viewpoint it presents at this time.

"In making our case we have dealt only with the utility of the motor truck. We might also with entire propriety have called to your attention the very large investment in the industry, the number of men it employs, and the hardship that will result from failure to get material to keep its plants active.

# Eagle Boats by New Ford Methods

Naval Architecture on Progressive System Utilized to Attain Quantity Production of Submarine Chasers—Same Underlying Principle Used in Automobile Plant Put to Work in the Production of These Boats

**W**HEN Henry Ford took the contract to build the submarine chasers known as the Eagle boats, and stated that he would meet a production schedule of one per day, it was immediately concluded that new methods would play an important part in arranging for this production.

The methods employed have come to light with the launching of the first of the Eagles. Ford has put the same underlying principles used in his automobile plant to work in the production of these boats with the result that he has revolutionized the industry. Ford does not *build* boats; he is *manufacturing* them. The illustrations on this page show how the work is handled. The exact details are not given, neither are the drawings to scale, as it would not be advisable to print them; nevertheless, sufficient is given to show the fundamentals.

Under the Ford system, production is a straight line proposition from the time the keel is laid until the boat

is launched from the hydraulic elevator. The boats are manufactured in a long building capable of carrying three abreast. The manufacturing operations are carried on while the boats are on cars and these cars pass along as various operations are completed until, when the boat is ready for launching, the end of the building is reached. The car, together with the boat upon it, is then carried out to the end of the launching pier.

The launching is not done in the conventional manner. There are no launching calculations to make and the engineers of the yard do not stand with their hearts in their mouths waiting to see that the boat slides off the ways properly and that there have been no mistakes in the launching calculations. Instead, the end of the launching pier is a hydraulic elevator which gently lowers the boat into the water, lets it float off the car and then rises to allow the car to be returned to the end of the building for the starting of another boat.

Sketch showing the course the Eagles must take before reaching the water. From the large construction building an Eagle is brought out onto a trestle-like device operated by electricity and carried along sideways until it reaches other tracks on the launching table. After being pulled on this table the boat is lowered by means of hydraulic power. The area called the transfer table measures about 240 x 500 ft. and has on the floor sixteen single railroad tracks on which rides the trestle-like construction that carries the Eagle to the launching well

*The first Eagle before it took its dip into the waters of River Rouge, July 11, at Ford's shipbuilding plant. With hardly a hitch, the 200-ft. boat was brought out of its housing and lowered into the water*

*The Eagle-1 was floated at 6.55 p. m. The end of the launching pier is a hydraulic elevator which gently lowers the boat into the water, lets it float off the car and then rises to allow the car to be returned to the end of the building*

# Heavy Trailers for War Department

Hauling Tractors to Double Their Speed and Save the Roads—Moving Guns and Heavy Equipment

*Five-ton crawler type of tractor mounting a 10-ton trailer on the special ramps provided for the purpose*

**T**HE peculiar demands of war work, particularly in the Ordnance and Signal Corps, and the rapid development of motorized equipment, are combining to produce some rapid developments in the trailer manufacturing industry. An unweildy piece of mechanism which, although mounted upon wheels, is incapable of traveling more than 6 or 8 m.p.h., can be mounted upon a trailer and transported at two or three times that speed with a resulting gain in efficiency and in time which may prove invaluable under war conditions.

There is no doubt but that the trailer industry is now only in its infancy and has much bigger prospects before it than would appear possible from superficial thought. The Signal Corps and the Ordnance Department have placed orders for tens of thousands of trailers of varied designs, and a number are already on their way to France and are proving to be highly successful. These trailers not only transport guns and form a firing platform for them, but also transport tractors of the track-laying or crawler type, which would be able to make only slow progress over the roads, and in fact, would be road destroyers, inasmuch as the track shoes are designed to obtain a hold on very rough ground and are equipped with grousers or other traction securing devices.

With a trailer it is possible to pick up the slow moving crawler or track-laying type of tractor and transport it to within a short distance of its field of operation, and make this transportation far more rapid than would be possible with the tractor itself and at the same time save wear and tear on the roads.

*Five-ton armored tractor which is typical of the type of vehicle which can be more rapidly and efficiently transported over good roads on a trailer, but which is capable under its own power of negotiating very difficult conditions of traction*

The track-laying type of tractor used by the Ordnance Department for pulling the 3-inch field guns and the larger 5-ton type is a good example of the sort of equipment which can be efficiently transported from place to place on a trailer. The four-wheel drive truck and other wheel types of vehicles used by the Ordnance Department form handy pieces of apparatus for transporting not only the trailer and its load, but also themselves carrying a fully loaded body.

The track-laying type of tractors now in use are capable of making speeds up to 12 miles per hr., which is exceptionally high for vehicles of this type, but running them continually at this speed places excessive

duties on the machine and is not productive of the highest efficiency. A speed of 6 or 8 miles per hr. for the 2½ and 5-ton types of creeper tractors is more in line with the limitations of the design.

Another big use to which the Ordnance Department and Signal Corps are putting trailers is for transporting shop equipment. These trailers have a capacity of about 4 tons and carry a complete repair shop capable of handling practically all emergency work behind the lines.

*Ten-ton capacity trailer, showing the standard drawbar mounting at the front end with the wheel guard at the rear, and also showing the location of the brake lever at the forward end of the trailer platform*

There are trailers upon which anti-craft guns are mounted in which the trailer itself is so designed that the gun need not be removed from it when it is fired. In fact, the trailer makes an ideal gun platform and the gun crew is placed upon the trailer in such a way that it can readily operate the gun and at the same time need not unload any of its equipment, so that it is possible to transport the entire apparatus rapidly from place to place. These trailers run all the way up to 10 tons in capacity for handling special loads.

For carrying the crawler or track-laying type of tractors the trailers are provided with loading means which permit the tractor to mount the trailers. These are in the form of ramps which are hooked to the rear of the trailer, allowing the tractor to mount itself upon the trailer under its own power. One of the illustrations shows a 5-ton creeper type of tractor climbing upon a 10-ton trailer, readily capable of transporting this tractor at a speed of 18 miles per hr. when towed by one of the standard Ordnance four-wheel drive type of vehicle.

The design of the trailers is naturally simple and is fairly well standardized except that some have four-wheel steer for easy maneuvering, while others have but two-wheel steer. The trailers are designed to operate in trains if so required, and are all fitted with the standard drawbar and steering lever arrangements by means of which the steering cross-arms are actuated by the movements of the drawbar. This allows the trailers to track accurately one behind the other in cases of long trailer trains. The rear wheel steer is generally locked in its position and is not in use unless actually required.

*Typical type of trailer used in Ordnance Department work, showing standard pintle mounted on the rear end for towing other trailers*

*Loading ramps which are carried as part of the equipment of the 10-ton trailer*

*Method of providing wheel guards over trailer to protect wheels from damage in loading and unloading*

# A New Method for the Testing of Airplane Wing Ribs

How Load Application and Distribution Are Controlled by a Series of Rubber Bands—A Comprehensive Description of the Apparatus Employed

By Irving H. Cowdrey

THE construction of the airplane wing rib is such that the question of stress distribution through the various parts does not readily lend itself to solution by direct calculation. Hence the determination of the relative excellence of various designs becomes very largely a problem for laboratory solution. Laboratory tests have a value directly proportionate to the accuracy with which the actual conditions of service are reproduced.

The actual load borne by each individual rib is distributed non-uniformly over the length, and the rib itself is a member of astonishing lightness and frailty.

The problem to be solved in the tests here described seemed after some consideration to divide itself into the following heads which will appear in the same order in the subsequent discussion:

1. Methods of support or suspension.
2. The distribution of load.
3. Application of load with the proper distribution.
4. Accurate measure of the load.
5. Determination of the distortion of the member under test.

\*Abstract of a paper read before the American Society for Testing Materials.

In the completed wing the ribs are connected by one or more continuous spars, passing from tip to tip of the wing. This affords secure lateral fastening at these points. To duplicate such a condition, the ribs were cut from a group or so fabricated as to leave in place a piece of spar about one inch thick.

This spar section may be seen at A, Fig. 4. In the cases furnishing data for this paper the two-spar suspension was used. To each of these spar sections was fastened a pair of steel plates  $\frac{1}{8}$  in. thick, each plate having in its center a  $\frac{1}{8}$ -in. hole. The fastening was accomplished by means of four  $\frac{1}{8}$ -in. steel studs having a nut on each end. These studs appear at A, Fig. 1, and the hole for one of them may be seen at I, Fig. 4. With these plates in place a 5/16-in. hole was bored through the wood to line as nearly as possible with the  $\frac{1}{8}$ -in. hole in the steel (see J, Fig. 4). The holes in the wood were then reamed so that a  $\frac{1}{8}$ -in. bolt with a finished shank could be just forced through by hand pressure. These  $\frac{1}{8}$ -in. bolts served then as the points of suspension and from them straps (B, Fig. 1) were carried to the maple plank C, Fig. 1, which in turn was suspended from a pair of chain falls. The suspension bolts were set up as tightly as possible without producing clamping action

Fig. 1—Apparatus for testing wing rib, non-uniform load distribution

Fig. 2—Force distribution for 150 lb. total load

between the suspension straps and the side plates on the rib. This was to afford as much lateral support as possible without interference with freedom of vertical deflection under load.

[This method of suspension does not perfectly duplicate the supporting of the ribs in the frame of the wing. The attachment of the fuselage to the spars is such that twisting of the spar at these points is prevented to a large degree. Actual conditions would then, possibly, be more accurately reproduced if the straps *B*, Fig. 1, were clamped to the spar section in place of the intermediate side plates at *A*.]

The very nature of the purpose of the airplane wings indicates a distributed load. Accepted diagrams for the distribution of load on a rib show that the distribution varies under the varying conditions of flight, both in general outline and in the position of maximum intensity. Under such circumstances a representative load diagram must be arbitrarily chosen. For the purpose of these tests it was assumed that a straight-line diagram would be a satisfactory approximation. Moreover, it was assumed that the point of maximum intensity could reasonably be assumed at a distance of one-fifth the chord length from the leading edge of the wing. (Shaded area, Fig. 2.)

[Some tests have been made by various experimenters since those here described in which the point of maximum load intensity is further from the leading edge. In some of the design calculations this point is taken at mid-chord instead of as indicated above.]

Such a distribution, as well as the general dimensions of the members, precluded the possibility of anything in the line of sand or hydraulic cushioning. Hence, a truly distributed load seemed impossible. With the member under test the total length was 60 in. A load, more or less concentrated, applied at each 4-in. interval giving 14 points of loading, could be presumed to give a fair approximation to the distributed load desired, provided these individual loads be properly proportioned.

The common methods of construction provide for the entire removal of the web of the rib at frequent intervals. A reference to Fig. 1 will show the extent of such removal in the type of rib under test. The portions of the rib over one of these spaces act like secondary beams under load. A number of loading points less than was used in the tests under consideration produces, in the writer's opinion, very serious effects on the stress distribution throughout the rib. It would seem that the number of loading points should be greater than those used in this case rather than less.

Using the number of loads noted above the problem of proper proportionment was attacked as follows: The load diagram for a total load of 150 lb. is divided into 14 parts (see Fig. 2). The ends are triangles with bases each 6 in. long. The remaining divisions then take the form of trapezoids, with the ex-

Fig. 3—Distortion of rib. Ordinates equal distortion with respect to a datum line through points of support. Ordinates are drawn full size in the above diagram

ception of division 3. Each division has a 4-in. base. Each of these areas then represents the load distribution desired over a length bounded by its extreme ordinates. The computed resultant for each of these areas appears below:

Load No.	Load, Lb.	Load No.	Load, Lb.	Load No.	Load, Lb.
1	7.5	6	15.0	11	6.7
2	13.3	7	13.3	12	5.0
3	19.0	8	11.7	13	3.3
4	18.3	9	10.0	14	1.9
5	16.7	10	8.3		

The application of concentrated forces according to the above schedule then should give a loading quite comparable with that indicated by the straight-line diagram. Theoretically these fourteen concentrated forces should be applied at the centers of gravity of the respective areas. This has been done for numbers 1 and 14. In the other instances it has been assumed that the middle ordinate is sufficiently near to the center of gravity. This introduces an error of from 0.03 to 0.17 in. in the location of these resultants. In the case of the larger central forces this error in location is least. These resultant forces are shown as solid lines in Fig. 2. To aid in a comparison to be made later their ends have been joined by a solid line.

The problem now resolves itself into one of the simultaneous application of fourteen different loads. Not only must the application be simultaneous, but the rate of increase in the application of each load must be such that under any total load whatever the relation between the various forces must be the same as the relation shown in the above tabulation.

Careful consideration of all well-known systems of multiple point loading lead to the final adaptation of what the writer believes to be a new departure in load application. It was felt that the most satisfactory solution of the problem could be reached by the application of load through a series of rubber bands of uniform properties whose widths should be made directly proportional to the load each band was expected to apply. These bands were obtained by cutting sections from a motorcycle inner tube. The particular tube used was of red rubber for a 28 by 3-in. tire.

With such an ideal series of bands, let one end of each be fastened to a rigid support, such as *E*, Figs. 1 and 4, and the other properly attached to the rib under test. The suspension of the rib as already described will permit it to be raised while a level (*D*, Fig. 1) enables a

Fig. 4—Detail of loading device

Fig. 5—Calibration curves for rubber bands

proper horizontal alignment of the supports. Under such conditions, neglecting the deflection of the rib itself, the fourteen loads will be applied at the predetermined points and with exactly the predetermined distribution.

In the device as illustrated by Figs. 1 and 4 the attachment of the bands is as follows:

Into the timber *E* are screwed at *K* heavy screw eyes of a size proper to take a  $\frac{1}{4}$ -in. stove bolt. Each pair of eyes are so spaced transversely on the timber that they permit on the bolt, between their inside faces, a pair of washers between which is a thin brass tube of a length equal to the width of the rubber band, *R*, which is to be used at that particular loading point. This gives the rigid fastening for one end of the band. Two  $\frac{1}{8}$ -in. hard brass wires, *G*, with a soldered eye (*L*, Fig. 4) in the lower end of each, *H*, and threaded at the upper end, pass through a small wooden block at *F*. On the upper side of *F* washers and nuts (*N*, Fig. 1) afford a ready means of adjustment of the length of this stirrup-shaped device. A stove bolt with tube and washers (*O*, Fig. 4) passes through the eyes of the wire rods. Such device affords a proper means of attachment between the upper end of the rubber band and the member under test. The proper adjustment of these stirrups will be discussed later.

As will be readily seen from Fig. 1 the heavy timber *E* (in this particular test a 6 by 6-in. hard pine stick weighing about one hundred pounds) rests on platform scales, *S*. On each end of this timber are three 50-lb. weights *W*. With no tension in the bands *R*, the tare weight of the timber and weights is read on the scales. The plank *C* is raised and maintained level, thus stretching the bands and hence applying to the rib, loads according to the predetermined schedule. The summation of these fourteen loads may be obtained at any instant by balancing the beam of the scales and noting the difference between the reading obtained and the original tare weight. The accuracy of this determination depends solely upon the accuracy of the scales. This should usually be within a half pound.

Scales of the ordinary platform type were used in this method of test for two reasons: First, in the opinion of the writer a greater precision can be thus obtained than with any

of the forms of testing machines commonly employed in laboratory work; second, it was desired to produce a method of testing that could be carried out easily by the manufacturer and permit and encourage experimental work on rib design by those who are not privileged to have at their disposal a properly equipped laboratory.

It is believed that the actual strength of a wing rib is but a partial solution of the problem at hand. The writer would not pose as an expert in aerodynamics nor in airplane design, yet to any engineer of analytical turn of mind the question of the effect of wing distortion must present itself. If the wing surface changes appreciably under conditions of flight does it not seem possible that some of the expectations of the designer may fall far short of fulfillment? If the designer expects so much lift, so much drift, and such a center of pressure, what unexpected factor enters into the problem through the possibly unforeseen distortion of his aerofoil?

The possible importance of rib distortion would seem to make such determination a requisite adjunct to any satisfactory method of test. However, in view of the fact that many variables in the line of material and workmanship enter into the fabrication of each rib, it would seem that undue precision in the distortion determination is neither necessary nor advisable. A precision of 0.01 in. is doubtless satisfactory and such precision is possible with the device under consideration.

Throughout this discussion it is assumed that any distortion of the timber *E* which may occur is of such magnitude as to be absolutely negligible. As the plank *C* is raised the rubber bands become elongated. This elongation is measured by means of dividers set in center punch marks in the ends of the stove bolts *H*, *K*, etc. If there were no distortion of the rib, the increment of length of all bands would be the same under any given total load. Such is found not to be the case. For the particular test under discussion, these increments of length for loads of 50, 100, 150 and 175 lb., respectively, will be found in Table I. In Fig. 3 these increments of length have been plotted from arbitrary reference lines not shown. Now points 2 and 10 are the points of suspension as well as loading points. Hence so far as the rib is concerned these are points of zero deflection.

In each curve of Fig. 3, straight lines have been passed through the intersections of the curve with these two ordinates. Such lines serve then as lines of reference from which the actual distortion of any part of the rib may be determined for the particular load in question. The distortion curves are drawn showing the rib in its true position in flight. It will be noted that with the load distribution assumed, the particular rib under investigation showed a noticeable droop of the leading edge with a corresponding up-tilting of the trailing edge. Whether this distortion is of a magnitude and nature to affect the aerodynamics of the craft in flight is not within the province of this discussion. In the interpretation of these curves it must be borne in mind that while the ordinates are plotted full size, the chord length of the rib is vastly contracted.

TABLE I—DETAILED LOAD INVESTIGATION

		Discrepancy	-7.2%			-0.8%			-1.1%			+0.9%		

While there was every reason to believe that the method of loading described in the previous pages would yield a load distribution quite closely in accord with that indicated by the diagrams of Fig. 2, still it seemed desirable to check the loads as carefully as might be. Such a check investigation is described in the following text.

Each band, after being cut to the proper width, was calibrated to determine the load-elongation relation through and somewhat beyond the range expected to be used in the rib test. These calibration curves appear in Fig. 5. For convenience in use, the increment in length has been plotted as abscissa rather than the actual length of the band. It should be noted, however, that the original length of the bands varied not over 0.02 in. The "band number" refers to the position of the band in question in the loading scheme (see Figs. 2 and 3). During the test, as has been previously noted, readings were made so that the increment in length is known for each band at each of the four specific loads investigated.

This increment, by reference to the calibration curves of Fig. 5, makes it possible to determine the force applied at each of the fourteen loading points. For any given set of readings, the sums of the individual forces thus determined should, of course, check with the summation as indicated by the reading of the scale beam. The closeness of this check between the apparent and actual summation is indicated in Table I. With the exception of the 50-lb. load investigation the discrepancies average about 1 per cent. It is only to be expected that the discrepancy for very small loads will be largely due to the difficulty in making accurate interpolations on the calibration curves.

#### Detailed Comparison Made

A detailed comparison has also been made between the computed and applied forces for a total load of 150 lb. Such comparison is shown graphically in Fig. 2. The forces as determined by the calibration curves have been plotted in the figure and the ends of ordinates thus obtained are joined by the dotted line. The closeness with which this follows the solid line joining the ends of the ordinates representing the desired forces would indicate that the method which has been herein discussed should prove satisfactory for this type of investigation.

It is necessary to make a very careful adjustment of each stirrup before attaching the rubber bands, in order that when the plank and rib are raised for the application of load, each band shall start elongating at the same instant. The most satisfactory of the methods tried is as follows: Lower the rib until the lowest point of the bottom edge will clear the timber *E*, Fig. 4, by some convenient amount. A single bolt should now be passed through the eyes in the timber *E* and through the eyes of the corresponding stirrup. By means of the adjusting nuts *F*, the stirrup may be brought to the proper length. When each stirrup has been thus adjusted, the level *D* should be set by means of the slotted end fastenings, so that the bubble will be in the center of the glass.

With all the above precautions observed, the stirrups may be released from their companion eyes, the rib and attachments raised and the rubber bands put in place.

#### The Rubber Bands

The tube from which these bands were cut was of uniform thickness throughout. This uniformity is very convenient since less care is necessary in adjusting the bands than would be requisite if the thickness varied as is the case with some types of tubes. It is believed that in cutting bands from a tube, as was done in this investigation, the width may be obtained accurately to about 0.01 in. In choosing the scale of width there are two antagonistic conditions to be considered:

1. It is desirable that the length increment of the band under load should be large compared with the deflection of the member under test so as to minimize the error in loading due to the variation in length increment of the various bands.

2. The maximum load applied by any band should probably not exceed one-fifth the strength of the band. This would be somewhat dependent upon the quality and resiliency of the material used.

The bands used in this test were of material showing a

strength of about 125 lb. per inch of width when tested as a band. The elongation at fracture was about 1000 per cent.

It would seem feasible to substitute for bands cut to a predetermined width as in this case, some of the better grades of para rubber bands, which may be purchased in definite sizes. Combinations of such bands could be used in parallel and tested by calibration, so as to obtain the desired force at each point of loading.

For the highest refinement it might be desirable to calibrate the bands, allow a period of rest, make the test and recalibrate after a second period of rest, using as a calibration curve the mean of the first and last determinations. In the opinion of the writer this double calibration should not be necessary. In order to justify this belief and to determine whether or not any appreciable change may be expected in the characteristics of the rubber bands within a reasonable time, a second calibration was made on half the bands six months after the calibration made to determine the curves of Fig. 5. The data for the original and secondary calibrations appear in Table II.

In the analysis of this table three things must be borne in mind:

1. The data were intended to serve as a basis for plots. In drawing the representative curves the slight variations will not appear, hence the algebraic sign of the variations has been recognized in computing averages.

2. The elongations may be in error  $\pm 0.01$  in.

3. The testing machine used has a precision of probably no better than  $\pm 0.1$  lb. within the range of load used.

When these last two items are taken into consideration it is very evident from an examination of the averages that the variations are negligible in all the bands quoted except perhaps band No. 3.

If the variation in the properties of the bands during a six months' period are negligible the short time variation need be given no great consideration.

#### Lateral Support

The rib pictured in Fig. 1 was tested to destruction with the apparatus as shown. It is true that these ribs receive certain lateral support at one or more intermediate points by means of the stringers. If it is desired to apply such support,

TABLE II—CALIBRATION OF RUBBER BANDS

there are several ways by means of which this may be accomplished. Three of these will be enumerated below.

1. To the plank *C*, Fig. 1, there may be fastened side pieces of white oak. These should be made with a typical "buck-stave" contour and held rigidly by through bolts. They should extend well below the lower edge of the rib. The inside faces should be polished with oil and be slightly lubricated before the test. They should be made and adjusted, by shims if necessary, so that a clearance of about 0.01 in. is present between them and the rib.

2. This type of support may be modified by using the "wooden buck staves" so separated that a yoke furnished with end rollers may be fastened to the rib at the upper and lower edges, and so adjusted that these rollers shall bear on the supports.

3. Some type of straight-line motion may be used. The supporting frame for this linkage may be fastened to the plank *C*.

In the opinion of the writer the type of lateral support first described should prove satisfactory.

#### Distortion Readings

It has been previously stated that the curves of Fig. 3 give an indication of the distortion of the rib. This is open to a slight objection, at least with the type of rib illustrated by Fig. 1. Several of the loads are applied at points beneath which the web has been largely cut away. At these points there enters a disturbing secondary beam action superposed upon the distortion of the rib as a whole. No attempt has been made to correct for this effect.

With the calibration curves at hand it is possible by means of the nuts at *N*, Fig. 4, to adjust the length of the stirrups during the test so that the load actually applied is exactly equivalent to that computed in the preliminary calculations according to the method shown by Fig. 2.

#### Extension of the Principles Involved

While this method of testing was developed to meet the exigencies arising in the testing of aircraft wing ribs, it is felt that it possesses the possibility of wide application. A number of ribs may be tested as a unit with any system of loading which experimental evidence or theoretical aerodynamics may suggest. A spar, a wing section, or any portion of the frame or of the completed craft may be loaded and the behavior of that portion may be investigated. The magnitude of the forces involved may be many times greater than those arising in the test herein described. Rubber tubing may be readily obtained which will yield bands showing a strength of 400 lb. per inch of width. Using bands of this type 6 in. wide will permit the application of forces of 500 lb. each.

With such forces spaced 2 in. apart, loads of 3000 lb. per lineal foot are possible. Under loads of such magnitude a very massive member must be used to replace the number *E*, Fig. 4. It would also seem possible to conduct tests in which the forces shall not be confined to a single plane. The chief difficulty to be surmounted would be that of constructing a suitable supporting frame to afford points of attachment for the various devices which would be found necessary in the application of the desired loads.

## Alien Enemies and Enemy Property

WHO is and who is not an alien enemy and what is and what is not enemy property, are clearly set forth in a statement recently issued by the Alien Property Custodian, A. Mitchell Palmer. It is surprising to some of us to learn that a German citizen may not be an enemy, while a peaceful American citizen sometimes is. Such however seems to be the case.

Enemy property, according to the Alien Property Custodian, includes any and every kind of property, money, chattels, securities, lands, indebtedness, accounts receivable, etc., which belongs to an enemy. Even if the property is held in the name of another—by a dummy or in trust—if the real beneficial interest belongs to an enemy, it is enemy property.

An enemy under the Alien Enemy Act is:

1—Any person regardless of citizenship or place of birth, which is within the boundaries of Germany, Austria-Hungary, or their allies, or within the territory actually occupied by their military or naval forces. A peaceful and law-abiding German or Austrian citizen residing in the United States is not an enemy; but an American citizen living in enemy territory is an enemy.

2—A person residing outside of the United States and doing business within the territory of enemy countries or their allies.

3—A corporation, if incorporated within the territory of enemies or their allies, or incorporated in any neutral country and doing business within the territory of enemies or their allies.

4—An official or agent of an enemy Government or any subdivision thereof.

5—All natives, citizens, or subjects of Germany or Austria-Hungary interned by the War Department.

6—All citizens or subjects of Germany or Austria-Hungary resident outside of the United States who are (a) wives of officers, officials or agents of Germany or Austria-Hungary, wherever resident; (b) wives of persons within the territory (including that occupied by military and naval forces) of Germany or Austria-Hungary; or (c) wives of persons resident outside the United States and doing business within enemy territory.

7—Citizens or subjects of Germany or Austria-Hungary who are prisoners of war or who have been or shall be interned by any nation associated with the United States in the war.

8—Citizens or subjects of Germany or Austria-Hungary who since April 6th, 1917, have disseminated or shall hereafter disseminate propaganda to aid any enemy nation or to injure the cause of the United States, or who have assisted, or shall assist in plotting against the United States or any nation associated with the United States in the war.

9—Citizens or subjects of Germany or Austria-Hungary who are included or who shall be included in the "Enemy Trading List" published by the War Trade Board.

10—Citizens or subjects of Germany or Austria-Hungary who, at any time since Aug. 4, 1914, have been resident within enemy territory.

Numbers 2, 6, 8, 9 and 10 apply only to persons resident outside of the United States.

Three-quarters of a billion dollars' worth of property have been reported to the Alien Property Custodian at Washington already, but from an investigation throughout the country it is known that there is much more not yet located.

Every one can help the nation by mailing the Bureau of Investigation, Alien Property Custodian, Washington, D. C., reports or information on enemy-owned property in his vicinity.

AFTER the war there is no doubt that France will adopt a mixture of alcohol and benzol as the national motor fuel, particularly for commercial vehicles, agricultural tractors, etc., says the *Petroleum Review*. Alcohol as a motor fuel is no stranger to Frenchmen, and would have been adopted years ago but for the lack of a settled policy to prevent speculation and violent fluctuations in prices. Before the war there were no motor vehicles running entirely on alcohol. But for two years the Paris General Omnibus Company used a 50 per cent mixture of benzol and alcohol, and only abandoned it for benzol owing to the steady rise in the price of alcohol. It is the intention of the French Government to secure a monopoly of alcohol, and to encourage its use.

# Exhaust Headers and Mufflers

An S. A. E. Paper Considering the Subject from the Standpoint of Aircraft Engineering—Present Practice Reviewed and Conclusions Drawn

By Archibald Black\*

**I**N the following notes no attempt has been made to treat exhaustively the design of exhaust headers or mufflers for airplane engines. The paper is intended chiefly to record some data collected on this subject during the past several years.

The exhaust header's primary purpose is to carry exhaust gases away from the engine, but it may be designed to perform certain other functions to advantage. The most important of these is probably the muffling of the sound of the exhaust, which may be brought about by a properly designed header.

In present practice the exhaust is taken care of in several radically different ways, the devices of the different designers ranging from the open port to the elaborate combined header and muffler as now used on some machines.

## Typical Constructions

Fig. 1 shows the open port, which was very popular on the old engines and was used until recently on the Curtiss 90-hp. JN-4 type engine. In that type no effort was made to carry away the gases or to muffle the noise. Fig. 2 shows the "stub tube" method, used on some Hall-Scott installations and recommended by the Hall-Scott Company for its engines. In this system each cylinder is furnished with an individual exhaust pipe several inches long, which points straight out from the engine and is cut off on the outer end at an angle of about 45 deg. to prevent the air from causing a back pressure when the airplane is moving. While this arrangement assists the cooling of the engine, it gives the maximum of noise and would appear therefore not entirely satisfactory for either military or sporting machines.

Fig. 3 illustrates what has come to be known by many as the German system on account of its origin on machines of that nation and apparent popularity among German designers. Tubes extend upward from each cylinder into the common header, which is of streamline section and points upward and slightly to the rear, directing the gases over the top of the upper wing. This reduces the noise heard from below and appears to be a very practicable, although not final, solution of the problem.

Fig. 4 shows an adaptation of the German system used on recent Curtiss JN-4 machines.

Fig. 5 is the original L-W-F header, consisting of short tubes run at right angles into a manifold tube, the front end being closed and the rear end connected by a flexible metallic tube to a straight pipe leading along the body to the rear of the pilot, the end being open to permit the escape of the gases. This design was discarded, after the first few machines, in favor of the method illustrated in Fig. 6. Here the individual pipes sweep backward on a liberal radius into the manifold, and the flexible pipe is replaced by a smooth steel tube, which is perfectly straight on some

models, depending upon the engine used. Fig. 7 shows the new header and muffler as fitted to some of the Curtiss machines. This header connects to a tube, which extends backwards along the body and terminates in a muffler.

The muffler is simple and most ingeniously designed; the exhaust tube is slotted and the metal bent outward to form two parallel flanges separated by spacers as shown in Fig. 8. The author had no opportunity to examine the earlier of these mufflers, as installed on R-4 machines, but the following description was reported to him by the field department of the L-W-F Company. The slot was about 5 to 6 ft. long and about  $\frac{1}{8}$  in. wide, starting near the engine and running back to the end of the tube, which tapered from the full section of the engine to a comparatively small section, open to the atmosphere, at the rear end.

One of the Curtiss engineers stated that no material loss of power was found to be caused by the use of this muffler. It has been generally conceded by those who have heard the engine running with the muffler in place that the noise of the exhaust is reduced to much less than its former volume. This bears out the author's experience with similar devices installed on several engines; these are referred to later in this paper.

At a later date the author made an examination of a similar muffler installed on one of the Curtiss company's JN machines equipped with Hispano-Suiza engines. This muffler had no large opening in the rear, the slot extending around the end instead. The slot was about 4 ft. long and  $\frac{1}{16}$  in. wide, approximately an allowance of about 0.04 sq. in. of slot per b.hp.—an extremely small area.

Fig. 9 shows a method of muffling the exhaust gases devised by Deperdussin, the French constructor. This is shown as

FIG. 8  
SECTION A-A

\*Chief Engineer, L-W-F Engineering Company, Inc.

Various designs used in airplane engine exhaust header construction

Other methods of solving the exhaust problem in airplane engine design

applied to an engine of the rotary type, the gases being carried through internal ducts to outlet holes at the rear of the body.

The French "Spad," Fig. 10, is furnished with exhaust headers extending backward for about 6 ft. from the engine. These headers are 3 in. inside diameter and terminate in a muffler consisting of a tube, round at the end, fastened to the exhaust header, which is flattened towards the rear, where it ends up about  $\frac{1}{2}$  in. in height and is considerably wider than the diameter of the front end. This rear end is closed except for four slots similar to those in top and bottom, described below.

In the flattened part, both on top and bottom sides, are a number of slots 1 in. long and  $\frac{1}{4}$  in. wide, with round ends. Each muffler has 78 such slots, giving a total area of 0.1267 sq. in. per brake horsepower for two such mufflers, based on 150 b.h.p. (the rating of the Hispano-Suiza).

The exhaust pipe allows 0.08836 sq. in. cross-section per b.h.p. and has considerable capacity due to its length. This capacity, by allowing expansion of gases, should assist the action of the muffler considerably. The above figures are exact measurements.

Fig. 11 shows the manifold used on later "Mercedes" engines. No detailed information on the construction of this manifold has been obtained by the author.

Fig. 12 illustrates a manifold used on Farman and Breguet machines, which appears to be similar in design to the "Mercedes" referred to above. The author has examined the Breguet manifold but could not obtain as much detailed information as desired. The inside apparently contains no baffle plates and the pipes from the cylinders enter tangentially to the body. This construction is evidently designed to reduce the velocity of the gases by causing them to expend their energy in eddy currents in the main chamber.

Fig. 13 is a scale drawing of one of the mufflers tested under direction of Prof. W. T. Fishleigh at the University of Michigan a few years ago. Five mufflers of different designs were experimented with and detail reports were published in *Horseless Age* in May, 1915. Of those tested, the muffler shown here was rated as the best in muffling ability and low back pressure, and one of the two best in low horsepower losses. This muffler was also the lightest of the five. Although the most efficient of those tested, it showed a b.h.p. loss of 3.6 per cent with engine delivering 38 b.h.p. This device weighed 14.5 lb. and had a capacity of 847 cu. in.

Fig. 14 is a scale drawing of one of the mufflers tested under the direction of Profs. H. Diedrichs and G. B. Upton of Cornell University. Details of the tests are given in the Second Annual Report of the United States Advisory Committee for Aeronautics. The results of tests of the particular muffler shown are given in part in Table I. It will be noted that this muffler caused a loss in horsepower of only 1.5 per cent, from which it would appear that it is efficient enough to justify its application in many cases to airplane engines.

Another type of muffler was experimented with recently by J. L. Cato of the L-W-F Company. This muffler was somewhat similar to the "Spad" device, but it had a slot in the end instead of being closed and was provided with small semicircular louvres in the side instead of slots. The areas allowed and the results obtained were in general very similar to those of the "Spad" muffler.

The two main considerations in the design of exhaust head-

ers and mufflers are the elimination of back pressure and the reduction of noise, which two requirements are, unfortunately, generally incompatible in practice. It is a simple matter to design headers fulfilling one, but not both conditions. The combining of both calls for a careful study and proportioning of even the smallest features of the device.

Research work of the manufacturers of blowers and air moving machinery is of considerable help in this work. F. L. Busey conducted a series of experiments\* to determine the effects of bends in air ducts. The curves published by him, combined here in Fig. 15, show that, when the radii are small, bends in square pipe offer more resistance than bends of the same radius in round pipe. The reverse is the case when the radii are large. This change of condition takes place when the radii equal about 0.6 times the diameter or side.

The American Blower Co. also has made some tests and publishes among its data sheets one giving the resistance of bends in terms of equivalent length of straight pipe.

It will be noted from Fig. 15 that the resistance of the bend is lowest when the radius is equal to  $2\frac{1}{2}$  times the diameter; that nothing is gained by making it greater than this; and that this resistance rises to a prohibitive value if the radius is less than 1 to  $1\frac{1}{2}$  times the diameter of the pipe. While this curve is based on tests which were made at lower speeds than are probably encountered in an exhaust manifold, Willis H. Carrier† concluded, from results of experiments, that losses in elbows through which air is flowing depend on the radius of curvature of the elbow and not on its size or on the velocity of the air.

It would therefore appear safe to assume that the curve given applies equally to the high velocity of flow in an exhaust manifold. Bends of high resistance in manifolds, if near the engine, will sometimes show up by becoming red hot. Sudden changes in the area of the exhaust pipe should be avoided. The areas of the individual exhaust pipes are usually fixed by the necessity of making their ends conform to the ports in the cylinders in order to obtain this condition. When this is not the governing condition, personal experience with different installations of headers and some investigation of

\*Loss of Pressure Due to Elbows in the Transmission of Air Through Pipes or Ducts.—*Trans. American Society Heating and Ventilating Engineers*, 1913.

†*Fan Engineering*, 1914 Edition, page 114.

Fig. 13—Muffler design giving best results in test by Professor Fishleigh

the areas of exhaust ports on several successful aircraft engines suggests that 0.14 to 0.16 sq. in. of area per b.h.p. of cylinder is a liberal allowance. The exhaust ports of the Hall-Scott A-5A, Thomas 8, Sturtevant 5A and Liberty, some of the engines studied, averaged 0.1668 sq. in. per b.h.p. As large a radius as possible should be used in these tubes which enter the manifold. The latter should be of large sectional area at the outlet end, tapering down to equal the area of the individual pipe at the other end. Where a tube extension is used it should be as straight as possible and of the same sectional area as the manifold end.

The proper area for the large end of the manifold is best determined for the experiment with several different sizes, noting the effect upon the horsepower of the engine while running on the dynamometer. This best size will probably vary with different engines, being governed, no doubt, by piston speed and the shape of exhaust ports as well as by the brake horsepower of the engine. As these experiments, however, cannot always be made, the author recommends allowing about 0.07 sq. in. of area per b.h.p., which figure is the average of the several American and foreign installations. When two headers are used—as on eight or twelve-cylinder engines—it should be kept in mind that each header handles only half of the total exhaust. For most engines this allowance will be found to be liberal.

Exhaust headers have been developed, by experiment, which have had areas as low as 0.045 sq. in. per b.h.p., but it would not seem advisable in the absence of a series of experiments to attempt to reduce the figure given.

In cases where headers are inclined to overheat, it has been suggested that they be furnished with a series of longitudinal fins, welded to the tube, to increase the radiation. Automobile engines have been built which were equipped with headers having fins somewhat similar to these.

Table II gives the required outside diameter of No. 20 U. S. gage tube for various horsepower, based upon the figure recommended above. This table, while giving satisfactory results, should not be considered final. It would be advisable to remove the manifold and note if there is any change in maximum speed of engine when running without it before the question is considered settled for the particular design.

#### Notes on Muffler Design

A very interesting and instructive treatise on the principles underlying the design of mufflers is found in part of the previously mentioned report of Profs. H. Diederichs and G. B. Upton.

Another interesting report of experiments, previously referred to, published in *Horseless Age*, contains conclusions from results and discussion of the principles of design.

The chief principle to be kept in mind in designing exhaust mufflers is the slowing down of the exhaust gases until their speed is below that of sound. This is accomplished by regular expansion, surface friction and the changing of the direction of flow. Most mufflers embody all three principles in greater or less degree.

It would appear to be a reasonably safe assumption that mufflers of the type shown in Fig. 14 may be designed for engines of any horsepower by making the areas of pipes and volumes of chambers proportional to the horsepower. The muffler shown is drawn to scale and was tested on an engine of 60 to 70 b.h.p.

The Curtiss type muffler seems to be one of the simplest and most effective devices in use, and some experiences of the author and his associates with mufflers of this type may be of interest. Experimental mufflers were designed along these lines, and were tested on engines of different makes. The noise of the exhaust was, in each case, reduced to very little more than the noise of an automobile truck engine of large power. Tests made with and without the muffler in place showed that no difference in the number of revolutions per minute could be detected with the tachometer while the engine was running at full speed. With the engine running at full speed one's hand could be held against the muffler slot without discomfort, in contrast to which it was noticeable that the heat of the gases became uncomfortably great when one's hand was held a couple of feet away from the end of the ex-

Fig. 14—Muffler used in tests results of which are given in Table I

haust pipe without the muffler. The speed of the gases was reduced to a slight puff.

Other work prevented the carrying on of further experiments, but the results appeared to suggest that the mufflers which were from 4 to 5 ft. long could have been reduced in length without loss in speed of engine or muffling effects.

While these mufflers were in use, several things were noted which called for attention. One engine was of the geared-down type, and when the muffler was in place the sound of the gears appeared to be of considerable volume, this noise being plainly heard above the sound of the exhaust. As these gears were lubricated by the engine oiling system, it would appear that some reduction of this noise could be obtained were the engine designed to permit lubricating them with a light grease instead of oil. It was also noted, with most of the engines, that once the exhaust was muffled, several other noises became apparent. These included the rattle of valve mechanism and noise of the propeller. In flight, while gliding with the engine running slowly, the "singing" of the wires was naturally more noticeable than before. The engines used in the above tests included a Sturtevant 140 b.h.p. Hall-Scott Model A-5-A, Liberty 8 and Liberty 12.

No high degree of accuracy is claimed for the tests described, as they were field and not laboratory tests. The results indicated, however, that in design of mufflers of this type it is advisable that the slot be kept narrow (1/16 in. was found to be satisfactory), and that a net area of 0.05 to 0.06 sq. in. per b.h.p. is ample. It did not appear to be necessary to leave any opening at the rear end as was done in the Curtiss R-4 muffler, better results in muffling having been obtained with the smallest end.

Fig. 15—Curves showing the effect of bends in air ducts

# U. S. A. Ambulance and Trailer

A Review of the Specifications for an Ambulance Body for the Class AA or G. M. C.  $\frac{3}{4}$ -Ton Chassis—Details of the Spare-Parts Trailer and Field Litter

**P**RODUCTION has begun on a large order for ambulance bodies of a design developed by engineers connected with the Sanitary Corps. Deliveries of these bodies will begin in August and the full rate of production is expected to be reached in September. A definite order for five thousand has been placed with two companies and it is understood that the Medical Corps is at liberty to order 7000 more from the same companies. In addition to the ambulance body the engineers have also developed a spare parts trailer and a field litter, both to be attached to the ambulance.

In designing this new body, as in the design of other automotive apparatus at the present time, three prime considerations, each of vital importance, were considered: First, the use to which the vehicle will be put on the other side; second, the methods by which it can be manufactured on this side and finally, that its construction be such as to require minimum shipping space.

## Standard Body Designed

The standard body is designed for application either on the  $\frac{3}{4}$ -ton G. M. C. chassis now used by the Medical Corps, or on the Class AA, U. S. A. military truck. The body will carry eight sitting patients and four lying. The design has been worked out so that two men can load the litters, instead of requiring three as is the case with the present type.

According to the specifications issued by the office of the Surgeon General, the design is intended to provide a strong substantial motor ambulance body, one that can be readily knocked down and assembled in the shortest possible length of time, consistent with boxing of disassembled body in the minimum size of shipping box. The floor, roof, side frames, and division panel, seats, deck frames, etc., are assembled as separate units, complete in themselves. The body is paneled with "vehisote," on the sides and at front division panels. The roof is made up of bows, or rafters, center rails, side rails and headers, and the whole is covered with "agasote." The edges of the roof are protected by sheet steel bent to angle form and screwed through agasote and side rails.

The aim has been to obtain complete interchangeability of parts so that the body can be shipped knocked down and assembled on the other side by comparatively unskilled men. The main parts, such as the sides, floor and roof will be

fastened together by bolts and nuts. The body is strong enough to carry the weight of two wounded men at the top. Although intended for carrying wounded men, the vehicle can be used for Ordnance or Quartermaster service that would ordinarily be required of a  $\frac{3}{4}$ -ton truck.

The specifications provide that all parts must be constructed to definite standard dimensions, with proper tolerances, so that any of the parts can be replaced, properly fitted and adjusted without requiring additional tool or machine work. All drillings, borings and framings must be made in connection with forms, jigs and templates, in order to insure complete interchangeability. The general dimensions of the standard body are as follows:

Length of body over corner posts .....	9 ft. 8 in.
Length of body from back of front division panel	
over rear post .....	7 ft. 10 $\frac{1}{4}$ in.
Width inside .....	4 ft. 8 in.
Front corner posts to center-line of wheel house, 6 ft. 5 in.	
Height from top of floor to top of roof, at center	
outside .....	5 ft. 0 in.
Height from top of floor to outside of edge of	
roof .....	4 ft. 9 $\frac{1}{2}$ in.

It will thus be seen that the body is roughly 10 ft. long, 5 ft. wide, and 5 ft. high. When these dimensions are compared with those of the packing box, which is 10 ft. 1  $\frac{1}{4}$  in. long, 5 ft. 1  $\frac{1}{2}$  in. wide, and 2 ft. 2 in. high, the economy in shipping space can be appreciated.

## Chassis a Commercial Product

The  $\frac{3}{4}$ -ton chassis is practically a commercial product with a few changes made as required by the special service. The speed with the governor off is about 40 m.p.h.; with it on about 20 m.p.h.; a four-cylinder engine, giving 27.5 hp. at 1100 r.p.m., is used.

The spring design is especially interesting, since it is the result of a large number of tests of different types. Half-elliptic springs, silico-manganese, graphite-filled, are used, with a heavy type of recoil check or snubber applied to each spring.

The rear springs are 54 by 2  $\frac{1}{2}$  in., with sixteen leaves. The flexibility is 275 lb. per inch, and the rated load 1350 lb.

The front springs, 38 by 2  $\frac{1}{4}$  in. have nine leaves. These

Left: Ambulance drawing litter carrier. Right: Loading the litter carrier on the top tier

are offset, the distance from the axle center to the rear eye being 20 in.; and 18 in. from that center to the front eye. The flexibility of the front springs is 515 lb. per inch and the rated load 900 lb.

The total weight of the ambulance ready for the road, without personnel, is about 4820 lb.; allowing for two drivers at 150 lb. each, eight patients at 200 lb. each, including their equipment, the maximum weight of the loaded ambulance is 6720 lb. The weight of the standard body is 1375 lb., and that of the chassis with driver's compartment is 2840 lb.; the remainder of the 6720-lb weight being accounted for by litters, water tanks and other special equipment.

The spare parts trailer is mounted on a  $\frac{3}{4}$ -ton commercial trailer, but the body is specially designed. The body frame work is of wood, which is covered with 20-gage sheet steel. One of these trailers will be provided for every twelve ambulances, so that enough parts can be carried to make emergency repairs on the road. The interior of the body is divided up into thirty drawers. A work bench can be opened out from the rear. A cover is arranged for the man working as shown in the accompanying illustration. Double doors are provided on each end and on each side, giving access to the sheet steel trays and drawers, which slide in and out on steel angle guides.

The general dimensions of the spare parts trailer bodies are as follows:

Length of body over all .....	94 in.
Width of body over all .....	42 in.
Height of body over all .....	36 $\frac{1}{4}$ in.
Length of lower floor boards .....	37 in.
Curvature of roof .....	1 $\frac{1}{2}$ in.

The field litter carrier has been designed by the Medical Corps engineers in this country. While the Allies have been using wheel carriers for wounded men, nothing like this has been developed. It is said this carrier will increase the effi-

Upper: Litter carrier in use carrying two men.  
Lower: Details of the litter carrier's construction

ciency of the Medical Corps stretcher-bearer 100 per cent. Two bearers can draw two wounded men in the litter carrier more easily than they carry one in the litter. The carrier can be hauled over very rough ground. It is designed so that it can be attached as a trailer to the ambulance, thus increasing the latter's capacity 50 per cent.

The two occupants can be completely covered by the curtain, or it can be lifted at the sides, or the top can be moved over to one side altogether.

About 150 carriers have already been ordered for overseas work and it is planned to supply one for every ambulance, except of course the vehicle in each company used for hauling the spare-parts trailer.

THE standardization movement has extended to the manufacture of farm wagons. The National Implement & Vehicle Association through its Farm Wagon Department has issued a report on the standardization meeting recently held at Louisville, Ky. The manufacturers have agreed to eliminate a large number of types and sizes in farm, valley and mountain wagons. Five classes of vehicles have been decided upon. Sizes of tires for the various types of wagons have also been standardized and the total number of sizes has been materially reduced.

The popularity of the motor car in Canada, and particularly in the Province of Ontario, is evidently increasing steadily. At the present time there are 75,000 cars in that province, this number representing an increase of 25,000 since the beginning of last year. For 1918 the prospects appear to be excellent.

*The operative must use both hands to trip this punch press. When in use they are out of danger.*

**P**ROSPECTIVE employers of women as operatives on machine tools must give consideration to the safety problem from a viewpoint slightly different from that which only takes into account what is a sufficiently wide range of probabilities when male operatives are used. This is another way of saying that the woman as a machine operator presents certain problems for solution by the safety engineer which the man does not. She has, to begin with, in most cases, an absolute unfamiliarity with machinery of any kind, she has long, flying hair and she wears skirts.

The hair and the skirt problems are being satisfactorily solved by the compulsory wearing of bloomers and caps. But the lack of familiarity with machinery and a more or less natural failure to comprehend the existence of danger where it really is—even though she often imagines it to be where it really isn't—are not counteracted by changing the character of her wearing apparel. Many safety engineers are convinced that a much more thorough safeguarding of machinery is necessary when women are to operate it. Others there are who hold that what is needed to make machinery safe for women is also necessary to make it safe for men.

The photographs reproduced on these two pages were made in the plant of the Dayton Engineering Laboratories Co., at Dayton, Ohio. The study of the problem of developing safety appliances for the machine which the women run in this plant has been most thorough and the installation of safety equipment has been most complete. A glance at the machines shown in the photographs will bear out this statement. The protection of moving parts of the machinery has been made so complete that it has not been found necessary or thought desirable to compel the women to wear caps to prevent their hair from flying

*Right—The swinging die in position. The operative uses one hand to trip the press and the other to hold the die in position. When both hands are in use, there is absolutely no danger of mashed fingers. Left—Loading a swinging die in position*

about and getting caught in revolving spindles or the like.

In the photograph of the women operating a multiple drill press, it will be noted that sheet metal guards have been installed to cover the spindles and even the belts and pulleys. In another photograph is illustrated the manner in which the flywheel of a punch press is entirely enclosed.

#### Swinging Dies Employed

For all press operations, it will be observed, swinging dies are employed which require that before a piece can be withdrawn from the die or another piece inserted the die must be swung out clear of the punch head and the danger of an accidental drop and resulting injury to a hand is automatically avoided. Furthermore, only such presses are employed as necessitate the use of both hands simultaneously for their operation.

The importance of accident prevention has evidently been given great weight in the Delco plant, which is as it should be. Like sanitation, fire protection and other preventive measures, it is difficult, if not impossible, to overdo it. What the law requires is usually a minimum and therefore not an altogether safe guide for any individual manufacturer who would safeguard his labor supply and maintain his lost time and turnover percentages at the lowest possible point.

#### Nine-Tenths of Accidents Preventable

It has been repeatedly pointed out and it cannot be repeated too often, that nearly 90 per cent of industrial accidents result from preventable causes. And of these, much the larger part are due to carelessness or apathy on the part of operatives and a lack of appreciation of danger. Much can be done, as has been done by the Delco company, to reduce the number and severity of accidents by the guarding of machinery, but it is also essential, experts agree, if maximum results are to be obtained, to secure the whole-hearted co-operation of the employees themselves. Where it is not practical to employ a safety engineer, whose exclusive business it is to see that safety measures are provided and educational work done among the workers, much good can be accomplished by a special safety committee of workers whose duty should be to study the causes of accidents, to suggest suitable means of prevention and to make frequent inspection of machinery and plant.

*Upper—Revolving parts of the drill press are covered with sheet metal guards as a means of absolute safety. Lower—The swinging die is shown here in position. Note the guarded flywheel*

# Predicting Strength and Efficiency of Airplane Propellers—II

By F. W. Caldwell

(Concluded)

The efficiency of the propeller can be computed by a method of trial as follows: First assume an efficiency of 80 per cent. The thrust will then be

$$T = \frac{0.80 \times 356 \times 550}{191} = 820 \quad (6)$$

The slip-stream velocity can be computed from the impact formula (2), and then

$$v = \frac{T}{AV \frac{\rho}{g}} = \frac{820}{104 \times 191 \times 0.00238} = 17.3 \text{ f.p.s.} \quad (7)$$

which means that the slip is 9 per cent.

From the Froude method the theoretical efficiency can be found as follows:

$$e_1 = \frac{V}{V + \frac{v}{2}} = \frac{191}{200} = 0.955 \quad (8)$$

## Analysis of Propeller Efficiency

Assuming that the section at 0.75 radius is representative of the propeller as a whole and that the value of  $L/D$  at this section is twenty, the efficiency by the aerofoil method can be obtained from the chart shown in Fig. 3. It is first necessary to find the corresponding value of  $ND/V$ , which is

$$\frac{ND}{V} = \frac{1400}{60} \times \frac{0.75 \times 11.5}{200} = 1.01 \quad (9)$$

The aerofoil efficiency is found from Fig. 3 to be 85 per cent. The product of the two efficiencies (see equation 8) is  $0.955 \times 0.85 = 81$  per cent. A further correction due to the spiral component of the slip-stream will reduce this to 80 per cent. Since the assumption made in computing the slip-stream velocity was correct it need not be recomputed.

The drag of the supporting surfaces at ground level and at a plane velocity of 191 f.p.s. will then be  $3400 \div 12.3 = 276$  lb. The parasite resistance, that is to say, the propeller thrust minus the wing drag will be  $820 - 276 = 544$  lb.

At 20,000 ft. altitude the air density can be taken as 50 per cent of the density at ground level. As a first approximation assume that the propeller speed will increase in proportion to the cube root of the horsepower (the horsepower being proportional to the engine speed, since constant torque is assumed), and in inverse proportion to the cube root of the density; then in level flight

$$N_1 = 23.3 \sqrt[3]{\frac{N_2}{23.3} \times \frac{1}{0.5}} = 33 \text{ r.p.s.} = 1980 \text{ r.p.m.} \quad (10)$$

Assuming a constant torque the engine will then deliver 503 hp. Assuming 80 per cent propeller efficiency

$$T = \frac{503 \times 0.80 \times 550}{V} = \frac{221,500}{V}$$

As a first approximation to determine  $K_r$ , assume the velocity to be proportional to the cube root of the horsepower delivered and inversely proportional to the cube root of the air density. Then

$$V = 191 \sqrt[3]{\frac{1}{0.5} \times \frac{503}{356}} = 270 \text{ f.p.s.}$$

$$\text{and } K_v = \frac{3400}{420 \times 0.00119 \times 270^2} = 0.0933.$$

The corresponding  $K_v/K_z$  will be 12.3 and  $K_z$  will be 0.00759.

$$\text{Thrust} = \text{Total Drag} = \left( \frac{\rho}{g} K_z S V^2 \right) + \left( \frac{0.5}{1} \times 544 \times \frac{1}{191^2} \right)$$

Since  $\frac{\rho}{g} = 0.00119$  at 20,000 ft. altitude, we have

$$\frac{221,500}{V} = \left( 0.00119 \times 0.00759 \times 420 + \frac{191^2}{0.5 \times 544} \right) V^2$$

Whence

$$V = 270 \text{ f.p.s.} = 184 \text{ m.p.h.}$$

Thus the assumption as to plane velocity are seen to be

Fig. 15—For absolute value of key,  $L/D$  and wing drag are constant. Power absorbed by drag of wings will then be proportional to speed of plane

Fig. 16—Propeller for constant torque engine. Best climbing speed at ground level 70 m.p.h.

correct for constant torque, so that they need not be recomputed.

To find the propeller efficiency under the new condition the thrust is first computed from the formula

$$T = \frac{550 \text{ hp.} \times e}{V} = \frac{550 \times 503 \times 0.80}{270} = 820 \text{ lb.}$$

Again the slip-stream velocity will be

$$v = \frac{T}{AV\rho} = \frac{820}{104 \times 270 \times 0.00119} = 24.3 \text{ f.p.s.}$$

The theoretical efficiency will be

$$e = \frac{V}{V + \frac{v}{2}} = \frac{270}{270 + 12} = 0.958.$$

Since  $ND/V$  has the same value as before, the true angle of attack will be the same and the aerofoil efficiency will again be equal to 85 per cent.

The product of the two will as before be 81 per cent, and this will be reduced to 80 per cent by the correction for the spiral component of the slip-stream.

It is apparent therefore that the efficiency of the propeller is the same for the two flying conditions, provided the engine torque is kept constant.

These results can be deduced without making the calculations as follows: The total lift of the plane may be expressed as

$$W = \frac{g}{\rho} K_v S V^2$$

in which  $S$  is constant for all altitudes and  $W$  and  $g$  are approximately constant. In order to maintain a constant angle of attack  $K_v$  must be held constant, then  $\rho V^2$  is constant, and  $V$  is inversely proportional to the square root of the density. For this condition the total drag of the machine will remain constant and the horsepower required to drive the plane will be equal to the horsepower required at the ground level multiplied by the ratio of the plane velocity at altitude to the plane velocity at the ground.

If the speed of the propeller is kept proportional to the velocity of the plane, its  $ND$  and its  $V$  efficiency will be constant. To maintain this speed the engine horsepower must be proportional to the ratio of  $N^3$  multiplied by the inverse ratio of the air densities. But since  $N^3$  is proportional to  $V^3$  it is also inversely proportional to the ratio of air densities. It is consequently necessary to maintain only the engine horsepower proportional to the speed. This is obviously the definition of an engine with constant torque.

The rate of climb to be expected from a plane fitted with a constant-torque engine is shown graphically in Fig. 13. (The calculations for rate of climb are given at the end of the paper.) If an adjustable-pitch propeller were applied to this engine, the propeller speed could be maintained at 1700 r.p.m. during the whole climb. The horsepower available and the rate of climb, Figs. 14 and 15, indicate such an improvement in the performance that the variable pitch feature becomes highly desirable.

#### Ceiling

Evidently the ceiling of such a plane is not limited by aerodynamical considerations, but only by the strength of the materials employed. The engine and propeller speed would continue to increase until something let go. The limiting speed of a propeller of this size would probably be about 2500 r.p.m. in thin air with the materials now in use. This would correspond to an air density equal to 31 per cent of that at the ground, and at an altitude of about 34,000 ft. In flying at greater heights it would be necessary to throttle the engine in order not to over-stress the propeller, so that the ceiling would be in the neighborhood of 45,000 ft.

In conclusion I wish to emphasize the fact that the variable-pitch propeller is, to a certain extent, limited to special cases. The design of a propeller for an engine with constant torque presents no difficulty, except that the climbing rate near the

ground must be reduced, owing to the slow speed of the engine. This is not serious and can be entirely overcome by the use of a variable-pitch propeller. The interesting feature of this development is the great speed to be expected. It is not out of the question to attain speeds of 200 m.p.h. at an altitude of 30,000 ft.

#### Conventional Design Compared to Adjustable Pitch Propeller

The following assumptions will be made in calculating the climbing rate with a fixed blade propeller.

1. Engine output = 170 hp.
2. Propeller diameter = 8 ft. and  $(A) = 50.3 \text{ sq. ft.}$
3. Radiator area = 3.3 sq. ft. Effective area = 50.3 — 3.3 = 47.
4. Velocity of airplane = 120 m.p.h. = 176 f.p.s.
5. Engine speed = 1600 r.p.m. = 26.7 r.p.s.

The calculations are as follows:

In order to compute the thrust assume a propeller efficiency of 79 per cent.

$$\text{Thrust} = \frac{550 \times \text{hp.} \times e}{V} = \frac{550 \times 170 \times 0.79}{176} = 420 \text{ lb.}$$

$$\begin{aligned} \text{Velocity of slip stream, } v &= \frac{T}{AV\rho} \\ &= \frac{420}{47 \times 176 \times 0.00238} = 21.4. \end{aligned}$$

$$\text{Slip} = \frac{v}{V} = \frac{21.4}{176} = 12.2\%.$$

$$\begin{aligned} \text{Theoretical efficiency (Froude method)} e &= \frac{V}{V + \frac{v}{2}} \\ &= \frac{176}{186.7} = 94.2\%. \end{aligned}$$

$$\text{True } P_e = \frac{186.7}{26.7} = 7.00 \text{ ft.}$$

We must now determine the value of  $\frac{ND}{V}$  and in doing

this it may be assumed that the section at 0.75 radius is representative of the propeller as a whole.

$$\frac{0.75ND}{V + \frac{v}{2}} = \frac{0.75 \times 1 \times 0.8}{7.00} = 0.858.$$

Assuming  $K_y/K_x = 20$ ,  $e_s = 86.5$ .

Then true  $e = 0.942 \times 0.865 = 0.815$ .

which is reduced to 80 per cent by the spiral component of the slip stream. (The assumption of 79 per cent in computing thrust is nearly enough correct so that it need not be recomputed.)

$$\text{The effective pitch angle } \phi = \frac{0.75\pi ND}{V + \frac{v}{2}} = 20.3 \text{ deg.}$$

Assume that the true angle of attack from chord is 0.5 deg. and that blade angle  $(\theta) = 20.8 \text{ deg.}$

$$\text{Output} = 0.80 \times 170 = 136 \text{ hp.}$$

#### Calculation of Propeller Efficiency Under Climbing Conditions

Assume climb at 65 m.p.h. = 95.9 f.p.s.

The speed in climbing = 1475 r.p.m. = 95.4 f.p.s.

Assume efficiency = 60 per cent.

$$\text{Thrust} = \frac{0.60 \times 550 \times 1475 \times 170}{95.4 \times 1600} = 542 \text{ lb.}$$

$$v = \frac{542}{47 \times 95.4 \times 0.00237} = 50.9.$$

$$\text{Slip} = \frac{50.9}{95.4} = 53.4\%.$$

$$e_1 = 100 \frac{V}{V + \frac{v}{2}} = 100 \times \frac{95.4}{120.8} = 79\%.$$

$$\frac{0.75ND}{V} = \frac{0.75 \times 1475 \times 8}{60 \times 120.8} = 1.22.$$

Effective pitch angle  $\phi = 14.5$  deg.

Angle of attack = blade angle — effective pitch angle

$$\frac{K_y}{K_x} = 20.8 - 14.5 = 6.3.$$

From Fig. 3,  $e_s = 79\%$ .

$e = 0.79 \times 0.79 = 62.3\%$ . This is reduced by the spiral component of slip stream to 60 per cent.

$$\text{Output} = \frac{0.60 \times 1475 \times 170}{1600} = 94 \text{ hp.}$$

Before going further to determine the climbing rate let us obtain figures similar to the above for an adjustable pitch propeller. For this assume that

Speed = 1970 r.p.m. during climbing.

$$\text{Output} = \frac{1970 \times 170}{1600} = 209 \text{ hp.}$$

Efficiency = 55%.

Air speed = 65 m.p.h. = 95.4 f.p.s.

$$\text{Thrust} = \frac{0.55 \times 550 \times 209}{95.4} = 655 \text{ lb.}$$

$$v = \frac{665}{47 \times 95.4 \times 0.00238} = 62.5 \text{ f.p.s.}$$

$$\text{Slip} = \frac{62.5}{95.4} = 65.5\%.$$

$$e_1 = \frac{V}{V + \frac{v}{2}} = \frac{95.4}{126.7} = 75.3\%.$$

assuming  $\frac{K_y}{K_x} = 20$ ,

$$\frac{0.75ND}{V} = \frac{0.75 \times 1970 \times 8}{60 \times 126.7} = 1.55.$$

$e = 0.86 \times 0.753 = 64.7$  per cent, which is reduced by spiral component of slip stream to be 59 per cent.

Output =  $0.59 \times 209 = 123$  hp.

#### Comparison of Climbing Rates

Assume

Weight = 1400 lb.

Power required to fly at 65 m.p.h. = 35 hp.

*With the Fixed Pitch Propeller*

Excess power for climbing =  $94 - 35 = 59$  hp.

$$\text{Rate of climb is } \frac{59 \times 33,000}{1400} = 1390 \text{ f.p.m.}$$

*With Adjustable Pitch Propeller*

Excess power for climbing,  $123 - 35 = 88$  hp.

$$\text{Rate of climb is } \frac{88 \times 33,000}{1400} = 2070 \text{ f.p.m.}$$

Gain in rate of climb = 49%.

The increasing speed of engine during climbing will have the tendency to overspeed the power plant while climbing and to allow the speed to become normal in level flight. The desirability of this feature is still open to question.

#### Calculations of Efficiency During Climbing

The following calculations apply to an adjustable pitch propeller on a constant torque engine:

(1) At ground level:

$$\frac{\sigma}{g} = 0.00238 \quad A = 104 \text{ sq. ft.}$$

$V = 103$  f.p.s. Engine output, 445 hp. at 1700 r.p.m.  
Assume efficiency = 55%.

$$T = \frac{0.55 \times 445 \times 550}{103} = 1310 \text{ lb.}$$

$$v = \frac{1310}{0.00238 \times 104 \times 103} = 51.4 \text{ f.p.s.}$$

$$e_1 = \frac{V}{V + \frac{v}{2}} = \frac{103}{128.7} = 0.80.$$

$$\frac{ND}{V} = \frac{1700 \times 11.5 \times 0.75}{60 \times 138.6} = 1.764.$$

$$\frac{K_y}{K_x} = 16$$

then from Fig. 3,  $e_s = 0.720$ .

$e = 0.720 \times 0.80 = 0.576$ , which is reduced by the spiral component of the slip stream to be 53 per cent.

Output (useful) =  $445 \times 0.53 = 236$  hp.

(2) At 10,000 ft. altitude

$$\frac{\sigma}{g} = 0.00178 \quad A = 104 \text{ sq. ft.}$$

$V = 118.7$  f.p.s. See Fig. 15.

Output = 445 hp. at 1700 r.p.m.

Assume efficiency = 56%.

$$T = \frac{0.56 \times 445 \times 550}{118.7} = 1155 \text{ lb.}$$

$$v = \frac{1155}{0.00178 \times 104.7 \times 118.7} = 52.5 \text{ f.p.s.}$$

$$e_1 = \frac{V}{V + \frac{v}{2}} = \frac{118.7}{145} = 0.819$$

$$\frac{ND}{V} = \frac{1700 \times 11.5 \times 0.75}{60 \times 153.9} = 1.59$$

$$\frac{K_y}{K_x} = 16. \quad e_s \text{ (from Fig. 3)} = 0.74.$$

$e_1 = 0.819 \times 0.74 = 60.5$  per cent, which is reduced by spiral component of slip stream to be 57 per cent.

Output (useful) =  $445 \times 0.57 = 254$  hp.

(3) At 20,000 ft. altitude.

$$\frac{\rho}{g} = 0.00119. \quad A = 104 \text{ sq. ft.}$$

$V = 144$  f.p.s. See Fig. 15.

Output = 445 hp. at 1700 r.p.m.

Assume efficiency = 62%.

$$T = \frac{0.62 \times 445 \times 550}{144} = 1055 \text{ lb.}$$

$$v = \frac{1055}{0.00119 \times 104 \times 144} = 61.7 \text{ f.p.s.}$$

$$e_1 = \frac{V}{V + \frac{v}{2}} = \frac{144}{175} = 0.823.$$

$$\frac{ND}{V} = \frac{1700 \times 11.5 \times 0.75}{185 \times 60} = 1.32.$$

$$\frac{K_y}{K_x} = 16. \quad e_s \text{ (from Fig. 3)} = 0.74.$$

$e_1 = 0.79 \times 0.823 = 65$  per cent, which is reduced by spiral component of slip stream to 62 per cent.

Output (useful) =  $445 \times 0.62 = 276$  hp.

#### Engine with Constant Torque

Calculation of  $K_y$  necessary to maintain flight at different speeds and altitudes.

Table showing values of  $K_y$ .

$\rho/gK_vSV^2 = 3400$ .  $S = 420$ ,  
whence

$$K_v = \frac{8.1}{\frac{\rho}{g} \times V^2}$$

To obtain rate of climb, the thrust and the wing drag can be computed. The difference between thrust and wing drag at maximum speed will be the parasite resistance. The parasite resistance for other speeds can be figured from the ratio of the cube of the velocities, and the wing drag by the usual method. From the sum of these two the power required to fly can be computed and when this is subtracted from the useful power delivered the excess horsepower and consequently the rate of climb can be figured.

For 130 m.p.h., assume  $K_v = 0.0935$ .  $\frac{K_v}{K_s} = 12.3$ .

$$\text{Wing drag} = W \left/ \frac{L}{D} = \frac{3400}{12.3} = 276 \right.$$

Power delivered to plane =  $0.80 \times 356 = 285$  hp.

$$\text{Wing drag} = 276 \times \frac{191.5}{550} = 96 \text{ hp.}$$

Assuming engine speed of 1150 r.p.m. at the ground, in climbing at 70 m.p.h. the engine will give 293 hp. Assuming 58 per cent propeller efficiency, the thrust will be  $\frac{0.58 \times 293 \times 550}{103} = 911$  lb., and

$$v = \frac{911}{0.00237 \times 104 \times 103} = 35.8 \text{ f.p.s.}$$

$$e_1 = \frac{V}{V + \frac{v}{2}} = \frac{103}{120.9} = 0.853.$$

$$\frac{ND}{V} = \frac{1150 \times 11.5 \times 75}{60 \times 120.9} = 1.38.$$

Assuming a  $\frac{K_v}{K_s}$  of 13 for this condition, the aerofoil efficiency will be 60 per cent, and  
 $e = 0.67 \times 0.853 = 57\%$ .

The figures used in plotting the curves in Fig. 1 are:

$V$  = Velocity of plane, ft. per sec.

$v$  = Velocity of slip stream, ft. per sec. =  $0.15V$ .

$D$  = Diameter of propeller, ft.

$D_1$  = Equivalent propeller diameter =  $0.580D$ .

The following calculations are used only to compute the power absorbed:

$b$  = Max. blade width, ft.

$b_1$  = Weighted average blade width =  $0.75b$ .

$\rho/g$  = Air density = 0.00237.

$e$  = Efficiency of propeller.

$$T = \text{Thrust} = \frac{\text{Hp.} \times e \times 550}{V}$$

$$\rho/g \times K_v = 6.3 \times 10^{-4}.$$

$$\frac{K_s}{K_v} = 20 \text{ (assumed).}$$

$f$  = Factor for power absorbed by blade.  
Aspect ratio assumed as 6. Number of blades = 2.

Factor for blade shape  $\begin{cases} = C \\ = 0.95 \end{cases}$

Note that the blade form used is not the same as Fig. 2.

$$\text{Effective disk area } (A) = (D^2 - 0.05D^2) \frac{\pi}{4} = 0.95 \frac{\pi}{4} D^2.$$

$$v = \frac{T}{\beta/g \times A \times V}$$

$$0.95 \times \frac{\pi}{4} \times D^2 \times V \times v \times \beta/g = \frac{\text{Hp.} \times e \times 550}{V}$$

$$D = 1437.5 \sqrt{\frac{\text{Hp.} \times e}{V^3}}$$

The following are used only in the derivation of the chart in Fig. 1:

$$C \times 2 \times \rho/gK_v \times b_1 \times R \times V^3 \times f = \text{Hp.} \times 550.$$

$$f = \frac{8800 \text{ Hp.}}{\rho/gK_v \times D^3 V^3 \times C}$$

$$\cot \phi = \frac{2\pi R N}{V} \text{ (At any radius } R).$$

$$\frac{ND_1}{V} = \frac{\cot \phi}{\pi}$$

$$\text{R.P.M.} = \frac{32.9 V \cot \phi}{D}$$

The first flight of a Liberty plane in France. Representatives of the Allied countries and welfare workers were present at the christening before the flight

# Converting an Automobile Assembly Room for Shell Manufacturing

Use of 3-In. Pipe and Wooden Beams Solves Problem of Hanging Line Shafting in Sawtooth Assembly Room—How Car and Shell Making Run Parallel Through the Same Shop

**W**HILE the making of shell in a plant designed for the manufacture of automobiles calls for the solution of certain minor problems of equipment, it also develops the fact that in many ways the car-producing establishment is admirably fitted for this kind of work.

The government has found that the 155 millimeter trench mortar shell lends itself particularly well to the manufacturing facilities of automobile plants, and there are certain representative concerns which are rapidly getting into production on this kind of work.

The conversion from automobile manufacture to shell manufacture, however, calls for some radical changes in the equipment, and it is interesting to note how these changes may be made with the least possible expense and the greatest possible efficiency.

The progressive assembly floor of a manufacturing concern is the part of the shop generally turned over for this work. As a rule the requirements of progressive production call for a long and often narrow room, which also works out very well for shell manufacture.

The first principle which should be observed is that the shell manufacture should be divorced absolutely from that of automobile manufacture. The two departments

should be distinctively separate, and each should stand alone without dependence upon any units in the other departments.

The illustrations herewith depict the manner in which a long assembly floor in an automobile factory, with an output of about thirty cars per day, was divided so as to allow car manufacture to go on to a curtailed extent and at the same time provide an ideal layout for the manufacture of the 155-millimeter trench mortar shell.

The building, which is 750 ft. long and 40 ft. wide, was divided longitudinally approximately in the center by a wire fence which prevented passage between the two departments. This is clearly shown in the accompanying illustration, where car manufacture will be noted as proceeding on one side and shell manufacture on the other.

As no line shafting is to be found in the assembly department of an automobile plant, it was necessary to install the line shafting in a building which had not primarily been designed for it. The building itself is of structural steel type, being the modern sawtooth style.

It was necessary, therefore, when installing the line shafting, to increase the overhead supporting strength of the structure. This was done by means of the wooden beams which are clearly indicated in one of the photographs illustrating this article.

The line shafting supports were built up of 3-in. pipe, clamped over the wooden beams in such a way that they could be readily moved if necessary.

The castings supporting the line shaft bearings are supported from this pipe in a very satisfactory manner, giving an installation which is exceptionally flexible.

The electric motors for the shaft drive are also supported overhead from the I-beam, which forms a part of the permanent structure of the building. At the point where these motors are hung the additional live load is compensated for by the installation of an upright of wood placed be-

*On the automobile side of the wire fence the cars come along the assembly chain on one side. The shell making machinery is on the other side*

*Showing how the munition manufacturing plant was divided from the automobile manufacturing plant by the wire fence down the center of the building*

*The receiving end of the plant. At the left are the cylindrical forgings, which are the shell blanks. These are printed by the United States Government. At the right are frames ready to be taken down the assembly chains to the automobile department*

neath the I-beam. This upright not only supports the load of the electric motors, but also acts as additional support to take the stresses imparted by the line shafting.

With this arrangement, the shell manufacture and the motor car manufacture run parallel. The raw stock for both products starts from the same end of the building, one on one side and the other on the opposite side. An illustration which shows this is given in the accompanying view, in which the shell blanks can be seen piled up on one side and the frame stock for automobiles on the other side.

Chicago—Mallers Bldg., 59 East Madison St., Phone Randolph 6960  
Detroit—95 Fort Street, West, Phone Main 1351  
Cleveland—Guardian Bldg., Phone Main 1142.

Cable Address ..... Autoland, New York  
Long Distance Telephone ..... 8760 Bryant, New York

## SUBSCRIPTION RATES

United States and Mexico ..... One Year, \$3.00  
Canada ..... One Year, 5.00  
Foreign Countries ..... One Year, 6.00

To Subscribers—Do not send money by ordinary mail. Remit by Draft, Post-Office or Express Money Order or Register your letter.

## HORSELESS AGE SUBSCRIBERS

Subscriptions for the Horseless Age transferred to the subscription list of AUTOMOTIVE INDUSTRIES in the merging of the two publications will be completed in full by the weekly issues of AUTOMOTIVE INDUSTRIES to the dates of expiration shown on the records of the Horseless Age Co.

Owned by United Publishers Corporation, Address 243 West 39th St., New York; H. M. Swetland, President; Charles G. Phillips, Vice-President; W. H. Taylor, Treasurer; A. C. Pearson, Secretary.

Entered as second-class matter Jan. 2, 1903, at the post-office at New York, New York, under the Act of March 3, 1879.

Member of the Audit Bureau of Circulations.

Automotive Industries-The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

## Aircraft Co-operation

FOR some months it has been a matter of wonder why those concerns engaged in the manufacture of Liberty aircraft engines should not have co-operated much more than they have, particularly when engine production has fallen more than 100 days behind the schedule and is continuing to fall behind. There is nothing that speeds up production like co-operation. We do not know of a single case where all of the factories engaged on the manufacture of Liberty engines and parts have been called together to discuss ways and means for stimulating production. There have been get-together meetings of the engineers, but not of the factory heads.

It was expected that when John D. Ryan took control, the sole reason or his taking it being that production must be speeded up, he would get all of the makers together and hold conferences on ways and means for accelerating production. So far, we know of no such conference having been held.

When Charles M. Schwab assumed control of pro-

duction for Emergency Ship Building Fleet he immediately got all of the ship builders working in his field together. It was not one conference but several. He was appointed to increase production and he set about on the co-operative basis to do it. Not only did he get the heads of the ship building yards together but he went further and talked co-operation with the workers. With Schwab there was only one avenue for increased production and that lay through greater co-operation, greater co-operation of worker with worker, greater co-operation of worker with employee and vice versa, and greater co-operation among the builders.

Cannot a chapter be taken from production in the Shipping Board and applied to advantage to our present aircraft situation?

Factories engaged in manufacturing aircraft engines should bear in mind that their individualities and local prejudices must not stand in the path of production as they might in peace days. These factories are a portion of our fighting army. Co-operation in all our army activities is the fundamental of success. Burying individual whims is innate in military training. The same must apply to our factories, which when engaged in this war work are not individual enterprises in the sense they were in peace days. In peace days a production delay was a factory expense but to-day that same delay is an international affair, a matter of world concern.

## Quenching Media

ONE of the arts that should be greatly advanced by activities in connection with the war is that of heat treatment of steel. Many of the parts entering into ordnance material require special heat treatment, and airplane engines also embody many hardened steel parts. The requirements of the automobile industry already have led to a great increase in the demand for heat-treating equipment and materials, and the conversion of automobile factories to shell manufacture and airplane engine manufacture will not check this growth. As a result of the increased demand for heat-treating equipment and material, considerable research work is being done along these lines at the present time. This was aptly illustrated by a paper on "Oils for Quenching" presented to the American Drop Forgers' Association by George Pressell. It appears from this paper that practically every known oil has been investigated as to its cooling properties and its permanency when used for quenching.

Many different qualities are required in steel for various purposes, and different quenching media are used to obtain different qualities. Water being a simple chemical compound, is not subject to chemical change at the high temperature to which the medium is raised by the red hot steel that is plunged into it. Oils, on the other hand, are of rather complex composition and when raised to a high temperature are subject to oxidation and chemical changes. Only certain constituents of the oil oxidize and precipitate out, and the remainder then

changes in its physical properties. As a rule it becomes more viscous and less capable of carrying off the heat from the steel quickly.

While viscosity is thus one of the qualities affecting the value of a quenching medium, another important factor is the temperature of vaporization. If this is too low a layer of bubbles will form around the object to be quenched and effectively insulate it against the cooling influence of the liquid.

The two classes of oil so far used most extensively for quenching are mineral oil and fish oil. Mineral oil of low flash point undergoes a chemical change when heated by the steel, becoming more viscous and therefore less effective as a quenching medium. Fish oil, on the other hand, is subject to rapid oxidation and whale oil is still more given to this trouble. The greatest stability is shown by a product of the distillation of wool grease. This oil possesses the further advantage of great fluidity and marked refrigerating properties. Price, of course, is an important consideration, and we can imagine that a product resulting from the distillation of wool grease is not particularly cheap, but the immunity from oxidation and chemical change warrant a higher price being paid for the oil, for not only does this chemical inertness permit of using the same oil for a very long time, but the results obtained in quenching are more uniform.

Wool grease itself is a product which until recently was allowed to go to waste. The discovery of new and important uses for this grease will serve to render the degreasing process more valuable and to extend its application. The science of by-products is a most interesting one and has never been cultivated so diligently as in these times of high prices and scarcity of materials.

## Clerical Work and Female Labor

THE announced intention of the newly organized Women in Industry division of the War Labor Policies Board to exert its influence to the end that women shall first replace men in clerical and other office positions with manufacturing establishments to the greatest possible extent before they are called upon to do the work of men in the shops seems like a logical course of action.

Women have done remarkable work in industrial pursuits and have shown that they are capable of doing much that it was formerly thought they could not do in the way of heavy labor. But it is not yet unquestionably established that they are really fitted physically to do continuously some of the kinds of work that they have done for a relatively short period of time.

There are, of course, some women who can do almost anything that a man can do and keep on doing it indefinitely. But that is not true of all women and is certainly not true of a class of women who have been prompted by one motive or another to seek employment in shop work. The class referred to is made up of those women who have not been accustomed in any way to the restraint of industrial employment or the physical exertion entailed by it. They are the women who will very

largely make up the addition to the ranks of labor which the sex will contribute. They should be placed first in positions where the work is of a kind that it has been demonstrated by long experience women can do efficiently and without bodily harm.

It is certainly not exercising good judgment to have men performing light work in the office of a manufacturing plant when women, unaccustomed to it, are doing heavy work in the shop. We should use the women on the light work first.

## A Convincing Short Haul Argument

THE compilation and publication of figures showing the relative tonnage carried by motor trucks over the highways between Akron and Cleveland, Ohio, and the three railroads running between the Sixth City and the center of tire-making, during the 9 months ending July 1, call attention once more in a most emphatic manner to the immense possibilities that lie in the development of short-haul motor truck routes for the relief of railroad congestion.

The road from Cleveland to Akron is 40 miles long and the service which motor trucks are rendering on it is equivalent to that which could be performed by the use of no less than 885 railroad cars each week. These 885 railway freight cars were, therefore, released for service in long-haul work or for service which is more directly vital to the winning of the war, and congestion at the terminals at both ends of the run was reduced to a proportionate extent.

During a recent week motor trucks carried a total of 3175 tons of freight over this one Ohio route, while the railroads paralleled it with a total carriage of but 4970 tons, which is almost an even break between the two systems of transportation.

But great as this relief is, it is by no means all that the motor trucks are doing in this case and the many others similar to it. The 3175 tons of freight carried over the entire route from one end to the other is but part of the freight carried over this road, some of it from terminals to intermediate points, some between intermediate points and some long-distance matter which went over the highways because it could be more expeditiously transported that way than by railroad. Such freight comprised new passenger cars on their way to take their places in the scheme of things economic and new motor trucks, many of which were headed for localities in which they will carry on and extend the kind of work which the Akron-Cleveland trucks are doing.

Much has been done toward showing the world how the motor truck can help, how our roads can and must be used as an organized part of the country's transportation system. Much still remains to be done, for the country as a whole and many of those who sit in high places do not even yet grasp the full extent of the possibilities. Widespread publicity given to what has been and is being accomplished on the Akron-Cleveland route and others like it will be most effective. To even the most dubious it should be convincing evidence.

# □ Latest News of the

## Order 75,000 of Four Truck Models

**Model TT, Four-Wheel-Drive, Adopted for Heavy Hauling—Ford for Light Work**

WASHINGTON, July 25—Seventy-five thousand trucks and passenger cars have been ordered to date. Four trucks, including the Class AA, A, B and TT, form the cargo truck program. The TT truck, of which official announcement of adoption was made to-day, is a four-wheel drive type designed by the Engineering Ordnance Department. Several models have been completed and tested. This truck was designed in reply to a request from General Pershing, who stated that the cars and trucks now used in France were not satisfactory. The TT truck is especially suitable for hauling large guns over rough country and has the ability of a tank to go over places generally considered impassable to other vehicles.

The Ford passenger chassis, following the request of the American Expeditionary Forces, has been adopted as a standard chassis for use in the army as a passenger car, light ambulance, light truck and so forth. There are now 3000 Ford ambulances in use in France, and this number will soon be increased to 8000. The Ford Motor Co. is working on an order for 5000 light delivery trucks, production of which began July 22 at the rate of 200 per day. The principal reasons for the wider use of the Ford are the ease of repairing, cheapness of operation, large production and the extremely low initial cost and the fact "that it can be used where many other passenger cars cannot."

The other two types of passenger cars tested and selected are the Dodge chassis and the Cadillac chassis. These are not new and are the regular models with certain additions and deductions. They will be produced in other factories if the needs of the government require it.

The AA truck, which is the GMC  $\frac{3}{4}$ -ton model, was decided upon because of its low gasoline consumption and its light weight. The principal change from the regular model is a superior spring development needed because this model is to be used not only for cargoes but as a heavy ambulance also. Seven thousand, five hundred of these trucks are being ordered from various factories.

The Class A truck, which is the White  $1\frac{1}{2}$ -ton truck with some changes, was selected after tests of many commercial trucks in all conditions of weather and load. It was adopted according to the Motor Transport Service because of lower gasoline and oil consumption, more

satisfactory performance both in Mexico and France, high speed work with pneumatic tires and the low cost of spare parts, the cost being approximately equal to the cost of the chassis complete. The Class A is to be used for staff observation, reconnaissance and as a high-speed truck.

One of the principal reasons for retaining the Class B model, originally known as the Liberty truck, says the Motor Transport Service, is its maintenance. Eighteen thousand of these trucks have been ordered. The cost of this truck is less than that of any other commercial trucks of the same capacity. The cost of the spare parts combined is identical with the cost of the chassis.

The Class B truck has given satisfactory service, a test of 15,000 miles, and was found to have greater strength, more power, more ability and to be better qualified on rough roads, an important factor, because this truck will operate in a zone of fire.

In rejecting many trucks under test the Motor Transport Service states that the rejections were in no way reflections on the commercial value of these vehicles. A majority of these were made for city work and consequently could not be expected to do exceptionally heavy rough work as required in France.

### Huge Airplane Program Expected

NEW YORK CITY, July 25—Occasional hints have been given regarding the airplane program for the next 12 months, and while nothing official or specific has been announced, the program gives promise of being an enormous one. Rumors of building 68,000 Liberty engines have been current. Of these 50,000 would go into airplane work and the remainder might find use in other fields. It is to be hoped that the production of planes will go over the 25,000 mark.

These figures may appear small in comparison with some of the pro-optimistic announcements of 14 months ago, when some people talked of 40,000 airplanes in a year, and others ventured to suggest possibilities of 100,000 in a year.

A program of 25,000 fighting planes is a very conservative one. Great Britain is producing more than 50 per cent above this total at the present time and has been doing so for some months. America's program should be 50,000 planes in the fiscal year, or more if possible.

### Moore is White New York Manager

CLEVELAND, July 23—William H. Moore, formerly manager of the White Co., Pittsburgh branch, has been appointed manager of the New York branch, to succeed R. H. Johnston, who was recently assigned to special executive work, with headquarters in Washington.

## Bristol Type Plane Abandoned

**Discontinued Manufacture Because It Is Tricky and Hard to Fly—Substitute Type**

WASHINGTON, D. C., July 25—The discontinuance of the Bristol fighting airplane which has been manufactured at the Curtiss Airplane Corp. in Buffalo, is apparently due to a variety of reasons. It was intended that the Bristol plane, which is an adaptation of a British fighting plane, would use a twelve-cylinder Liberty engine. This engine has too much power for the plane.

For a month there have been occasional rumors regarding the failure of this plane. It has been known that the plane is very hard to fly and might be classed as dangerous. The original British Bristol has been designated a tricky plane but in the adaptation of the plane in America these troubles were increased. The reason seems to be that the upper wing produces a strong down draft, which exerts a downward pressure on the elevator. The result is a tricky machine and one that is very hard to manage. While this characteristic is present in the British prototype it was not serious.

For a time it was thought this defect might be remedied and although 100 of such machines were in production 2 months ago, it was found impossible to make a satisfactory flying machine out of it.

It has been suggested that an eight-cylinder Liberty engine would be about the correct size for a plane such as the Bristol. A year ago when the Liberty engine program was outlined, the program included an eight-cylinder type using the same cylinders and valve mechanism as the twelve. This program was disturbed last fall when it was decided to produce only the Liberty twelve.

Within the last few months it has been decided, although not officially announced, to start the manufacture of the Liberty eight. This seems to be due to the fact that the Liberty twelve is too powerful for many of the planes. In this connection it is reported that the Liberty twelve is too powerful for the DH-4 plane in which it is at present being used, and it has been suggested that a Liberty eight would have sufficient power for this plane in many cases.

It is understood that a new type of combat plane resembling the British Spad and will be known as the S. E. 5 will be built. It is to be manufactured here for use in France. This probably will be equipped with a Hispano-Suiza engine.

# Automotive Industries

## British Standardize Planes to 5%

### Plan of S. A. E. to Further American Work Told at Dinner to Sir Henry Fowler

NEW YORK CITY, July 19—Sir Henry Fowler, representing the Royal Air Service of Great Britain in America, and also having in charge securing of materials for production of much of Great Britain's 3000-a-week airplane program, was given a testimonial dinner this evening by the Council of the Society of Automotive Engineers. The dinner was an informal affair which twenty attended. President Chas. F. Kettering, in presiding, told of the excellent co-operation between British aircraft engineers and American aircraft engineers in standardization work. This co-operation began with the international convention last January.

Sir Henry Fowler in referring to the possibility of greater standardization in airplanes, as well as in airplane engines, told of recent British experiments in which different engineers were asked to bring out a design that would meet certain war requirements. These engineers working along their individual lines produced machines that differed only in 5 per cent of their total. In other words, these machines were practically 95 per cent standardized. If it is possible to obtain machines that are 95 per cent standard by engineers working separately on the same assignment, it should not be difficult to obtain practically 100 per cent standardization with these engineers co-operating and working together on the same job.

The necessity for greater standardization in aircraft work was the dominating thought at the dinner. The S. A. E. has drafted a plan of aircraft standardization work which it believes could be satisfactorily worked out. This would bring together standardization work for the navy as well as the army. It would centralize this work in one person, together with a committee, which would bring about much quicker results than at present where a decentralized policy of standardization is resulting in chaos. The British policy of standardization is centralizing it in one person who has the authority to carry it out. This person has an organization of committees and sub-committees representing the various industries involved so that decisions are not arbitrary but the result of mature consideration.

#### Airplane Report After Aug. 1

WASHINGTON, July 24—Government control of all aircraft factories holding

Government contracts is likely to be recommended by the Senate Aircraft Investigating Committee in its report which will soon be made public. The Committee is still holding hearings and it is likely that the report will not be made public until after Aug. 1. Members of the Wright-Dayton Aircraft Co. were examined yesterday.

The Liberty engine, it is reported, will be highly praised by the Committee. Its weight and power have been found of great value. It is reported that contracts for 60,000 of these engines will be placed during the next few weeks for various types but principally the Liberty 8's to be used in American tanks. It is said that only the Liberty engine will be used hereafter in tank construction in this country.

Control of the aircraft factories will probably be recommended through a centralization of the several factories now holding contracts. It is said that the Committee will find the earlier criticisms of the Senate fully justified and will give credit to John D. Ryan for bringing the program up to what is now considered a fairly satisfactory condition. Some of the members of the Committee promise "sensations" in the report but refuse to make them public now.

#### Pierce to Bring Out New Model With Twenty-Four Valve Engine

BUFFALO, July 24—The Pierce-Arrow Motor Car Co. will begin deliveries on Sept. 1 of a new passenger car model equipped with a 6-cylinder engine having 24 valves, detachable cylinder heads and thermostatic control of the cooling system. There will also be certain other detail improvements in the chassis which, so far as dimensions go, will be similar to the smaller one of the two models now produced.

#### Deutsch Enters Signal Truck

DETROIT, July 23—S. Deutsch, formerly vice-president of the Clus Mfg. Co., Milwaukee, and sales engineer of the Stewart Mfg. Co., Chicago, has been elected vice-president and director of the Signal Motor Truck Co., Detroit. He will have charge of production and sales.

#### Oakland Goes Into Truck Manufacture

PONTIAC, MICH., July 23—Within 90 days the Oakland Motor Car Co. will have on the market a 1-ton truck. It will be of 130 in. wheelbase and have turning radius of 25 ft. to the left and 21 ft. to the right. It will be equipped with solid 34 x 3½ front tires, and 34 x 5 rear tires. No schedule of production has been determined.

## M. T. S. Spends 15% of All Money

### Motor Transport Service Completes Organization—Branches in Four Cities

WASHINGTON, July 23—Fifteen per cent of the United States Army averages of personnel, expenditures, service and equipment, it is reported, is in the hands of the Motor Transport Service, which displays that division's great importance and emphasizes the value of the internal combustion engine in this war.

The Motor Transport Service, headed by Col. Fred Glover, and created a few months ago, as announced in AUTOMOTIVE INDUSTRIES, is just completing its organization as shown in the chart herewith. The various appointments as made from time to time have been announced previously. The latest include the creation of four branch offices in New York, Cleveland, Detroit and Chicago which will have charge of production and inspection for their respective districts. Capt. John Devore is in charge of the Cleveland district, Major Wilcox of the Ordnance Department, the Detroit district; Captain Jaco of the Engineer Corps, the New York district and Major Edgerton of the Quartermaster Department, the Chicago district.

More than 6000 of the class B, 3-ton standard Army trucks have been delivered. (Continued on page 168)

#### To Examine Kenly in Aircraft Hearing

WASHINGTON, July 22—The examination of Major General William L. Kenly, Chief of the Department of Military Aeronautics, Saturday is expected to conclude the hearings of the Senate Military Sub-Committee investigating aircraft production. The committee will probably draft a report within the next week. It is expected that the report will not touch upon the alleged extravagances and mishandling of Government money, that phase of the situation being entirely in the hands of the Department of Justice and Charles E. Hughes, President Wilson's special investigator.

General Kenly's testimony was not made public, but it may be said it was chiefly a discussion of remedies for conditions found by the committee.

#### Olds to Manufacture Trucks

LANSING, July 23—The Olds Motor Works is planning to bring out a ¾-ton truck in the near future. It is stated that the output will be 8000 trucks for the coming year.

# The Government's Labor Program

Plans Completed for Federal Recruiting and Distribution of Nation's Labor Supply—Unskilled Shortage Now 500,000 and Soon Will Be More Than 2,000,000

WASHINGTON, July 20—The war industries are at present short 500,000 unskilled workers and coming needs are for between 2,000,000 and 3,000,000 more, according to Nathan A. Smyth, Assistant Director General of the United States Employment Service in charge of its unskilled labor section, who addressed leaders of industry management and labor here to-day. The conference comprised industry management and labor authorities from 28 states east of the Mississippi River, who were here to learn the details of the Government's war labor recruiting program, and who will form the community labor boards which will enforce the new labor regulations in the various localities.

It is also said that the demand for skilled workers exceeds the immediate available supply and before long will require the taking over of every tool maker and dye sinker for war work.

On the other hand, several speakers, including employment managers of large corporations on war work, told how the United States Employment Service efficiently has supplied their labor needs. One example was that of the American National Corp. at Hog Island, for which the Employment Service secured 30,000 men.

The complete program for supplying war labor was outlined. The need for a program was attributed to the growing inability of war industries to secure required labor resulting from:

## Causes of Labor Shortage

Decreased labor supply due to cessation of immigration since 1914.

Competitive recruiting for labor.

Restlessness of labor.

Stripping of war industries through reckless labor recruiting.

Hoarding of labor supply by individual states.

The program will be enforced promptly by the co-operation of every patriotic citizen; ultimately by the full force of every Government department.

The principles of the plan are based on the fact that:

In time of war all labor resources constitute a common supply for the benefit of war industries.

Industries not directly connected with the war should contribute equitable shares of their labor to important war needs.

Equitable distribution of non-war workers can be secured only through central agencies, directed by President Wilson, to have sole direction of all recruiting of civilian workers in war work.

Recruiting of labor must be solely conducted so as not to take men from war work, railroads or farms.

Movements of labor should be made and placed as near as possible to the demand.

Competitive increase in wages should be

prohibited and war wages stabilized so far as possible.

The new program will be carried out by the recruiting and distribution of labor through the United States Employment Service of the Department of Labor. Paid officers of the service and agents of the Public Service Reserve, the recruiting branch of the service, whose agents are largely volunteers, will conduct recruiting.

## Recruiting and Distribution Plans

Distribution of labor will be controlled by the Employment Service.

Local community boards comprising representatives of employers and the service will assist recruiting and distribution.

Control of private and prevention of competitive recruiting will be accomplished by the United States Employment Service backed by the power of other Governmental departments.

It is expected that these agencies will:

Eliminate competitive recruiting promptly.  
Standardize wages as soon as the War Labor Policies Board announces a wage scale.

Operate successfully through the 500 branches of the United States Employment Service.

The program applying to the recruiting of unskilled labor will be effective Aug. 1. It will handle unskilled labor first because the shortage is more acute, but will shortly take over all war labor problems.

The program will be extended to cover "hiring at the gate" when it is sufficiently organized, and will take over non-war work labor in case competitive recruiting by non-war employers proves injurious to war industries.

In the meantime employers are permitted to do their own recruiting of skilled labor but after Aug. 1 must not:

Offer superior inducements to men already employed in war work.

Advertise unless authorized by the Employment Service.

Arrange to advance pay for transportation of labor except with the consent of the United States Employment Service.

Employers not engaged in war work may recruit labor themselves but must not:

Offer superior inducements to workers in war work.

Advertise for labor without the consent of the Employment Service.

## Women Not Included

The new recruiting program for the present does not cover the recruiting of women workers.

It includes only at this time plants whose maximum force exceeds 100 men. Labor may be recruited privately for

railroads and farms. War work is taken to mean the manufacture of any product or erection of any structure directly or indirectly connected with the war.

Coal mining is not wholly war work.

Railroads and farms are engaged in war work to the extent that they are to be protected from recruiting by other industries.

An employer engaged only partially in war work is prohibited from recruiting labor himself for his war work to the same extent as if he were engaged wholly in war work. He will receive the benefits of the Government's recruiting program in getting labor for his war work. He will be expected to contribute from his non-war organization for war work purposes. He will have the same rights for securing labor for non-war work as employers engaged wholly in non-war work.

Unskilled labor is defined as meaning common labor.

A card system may be devised later by the Employment Service, but none is contemplated for the present.

An organization of 100 workers means an organization where 100 males, exclusive of clerical and administrative force, is employed.

Employers can establish the fact that they are doing war work by submitting the facts to the state director of the United States Employment Service of their state.

## No Restriction of Choice

Employers will not be restricted in their choice of the men recruited for them. They can exercise the right of choice either at the plants or at the points where the labor is recruited. Employers can hire men who come unsolicited, but this is not considered advisable by the Service. Employers partially engaged in war work will be allowed to use only labor sent by the Service in private work under permit.

The state directors of employment are to be referred to in all doubtful labor cases. Appeal can be taken from them to the director general of Employment Service at Washington, who in serious cases will secure a decision from the War Labor Policies Board. Workers are not under compulsion to get into war work except from a sense of duty, and are free to take any job offered by the Service they may prefer. They can secure work in any way, by their own solicitation or through the Employment Service, but it is urged that they use the Service. Workers will be told conditions of employment and terms as far as possible before they are enlisted for the work. They do not have to accept the position if transported under Government auspices if they do not want to, but must refund the transportation costs.

There is no limitation to the length of time a worker must stay at the position secured for him by the Service. He may change his job whenever he desires. There will be no form of black list created. Transportation will be paid to the point of employment or advanced and deducted from wages. This will be later uniformly established by the War Labor

**Policies Board.** Wages will not be paid during the time of going to the job. Cost of feeding workers en route will be made a part of the transportation.

Demands for unskilled labor will be ascertained by blanks distributed to all employers through the various Government departments. All employers should have received such blanks before July 20. If not received they should apply to the state director of the Employment Service.

Unskilled labor will be divided into quotas to prevent any state or community from being drained unfairly. The quotas will be determined by the United States Employment Service, according to estimates secured from each state showing the extent to which workers have already been sent to war industry and what unskilled labor still remains in non-war industry. The quotas will be distributed on the basis of the male population in the respective states corrected by the estimates of changed conditions due to the war and according to the extent of the population in agricultural work. Quotas will be announced as soon as all data are received.

It is expected that all employers in non-war work will take back the workers recruited for war work when they are no longer required in the latter industry.

Local labor supplies will be issued so far as adequate to meet local demands. Where the supply is not sufficient it will be distributed primarily among employers requiring similar numbers, assigning to the employers who need larger numbers of men those brought from other states.

#### Will Advance Transportation

The United States Employment Service will transport the workers out of its funds and collect this cost from concerns benefited. Movements of men for any considerable distance will be considered only in parties escorted by officers of the Employment Service. They will be examined by experts, physically and mentally, as to qualifications before being transported.

Employers requiring war workers should fill in the blanks received from the Service and all additional blanks weekly as demand for workers require. Employers engaged in non-war work can secure assistance from the Service if they desire it, but may recruit workers separately from the Service provided they do not offer superior inducements.

Individual workers desiring war work should register with the nearest branch office of the United States Employment Service or with the local agent of the public service reserve. Individual workers are warned not to leave non-war jobs before the Service secures war work for them.

A non-essential industry is any industry not engaged in war work directly or indirectly.

#### Packard Leases Adjoining Plant

**DETROIT, July 23**—The Packard Motor Car Co. has leased for 3 years the plant formerly occupied by the National Body & Trimming Co.

## Industrial Condition Reports

### Score of Regional Representatives Will Collect Data on Sources of Supplies

**WASHINGTON, July 22.**—For the purpose of keeping the Government advised concerning sources of supplies and industrial conditions in all parts of the nation, twenty regions have been created with regional representatives. National conditions in providing new resources, conversion possibilities, direct contact between the War Industries Board and business, and uniform methods will be handled by these representatives. They have been appointed as follows:

Region No.	Headquarters	Representative
1.	Boston	Stuart W. Webb
2.	Bridgeport	D. B. Pierce, Jr.
3.	New York	Wm. F. Morgan
4.	Philadelphia	Ernest T. Trigg
5.	Pittsburgh	George S. Oliver
6.	Rochester	Esten A. Fletcher
7.	Cleveland	Wm. B. McAllister
8.	Detroit	A. H. Templeton
9.	Chicago	D. E. Felt
10.	Cincinnati	Edwin C. Gibbs
11.	Baltimore	
12.	Atlanta	
13.	Birmingham	T. H. Aldrich
14.	Kansas City	F. D. Crabbs
15.	St. Louis	Jackson Johnson
16.	St. Paul	
17.	Milwaukee	August H. Vogel
18.	Dallas	Louis Lipsitz
19.	San Francisco	Frederick J. Koster
20.	Seattle	

To illustrate the conversion possibilities the War Industries Board points out that a former Pennsylvania linoleum factory is now making 4.7-in. shells, a Duluth horseshoe manufacturer is turning out trench picks, a Milwaukee rowboat motor maker is manufacturing hand grenades and trench pumps, a Detroit stove company is producing bombs and anchor parts, and a New York shirt-waist manufacturer is making signal flags.

The regional organizations will be under the supervision of Charles A. Otis Chief of the Resources and Conversion Section of the War Industries Board.

#### Plans Tractor Courses for Owners

**CHAMPAIGN, ILL., July 23**—The Department of Farm Mechanics of the State University of Illinois is arranging a series of 2-week tractor courses which will run from Oct. 15, 1918, to March 17, 1919. The attendance will be limited to 50 pupils for each course, recruited from tractor owners and automotive dealers.

Eight hours of each week day will be devoted to the study of tractors and tractor equipment. The time will be divided between two lectures and six hours of laboratory practice.

#### Metzger Heads Truck Committee

**LANSING, MICH., July 20.**—William E. Metzger of Detroit has been elected chairman of the Committee on Motor Truck Highways and Express Routes appointed by Governor Sleeper to further

the plan of motor truck expresses in this State. Fred Z. Pantlind of Grand Rapids was chosen vice-chairman and Burt Wickham, assistant secretary of the War Preparedness Board, secretary. Arrangements for a complete census of the possible routes in the State, through the various Chambers of Commerce, Boards of Trade and other civic organizations, will be started at once. Resolutions were also adopted asking a change in the State constitution so that regular rates can be made for the various routes, thus controlling them as common carriers under the railroad act.

#### M.A.M.A. Would Support Airplane Show

**NEW YORK, July 20.**—At the quarterly board meeting of the Motor and Accessory Manufacturers Assn. it was decided that this body will support an airplane show if such is permitted to be held by the War Department. The show committee of the association was instructed to make its usual contracts with the National Automobile Chamber of Commerce covering both the New York and Chicago shows.

E. W. Beach has resigned as a member of the executive committee because of his affiliation with the Bureau of Aircraft Production in Washington but will remain a member of the Board of Directors. His place on the executive committee will be taken by William M. Sweet.

One new member, the Sewell Cushion Wheel Co., Detroit, was elected to membership.

#### Working Hours and Industrial Efficiency

In the article on pages 89 to 91 inclusive of the July 18th issue of AUTOMOTIVE INDUSTRIES which dealt with the effect of long working hours on industrial efficiency, the diagrammatical illustrations for cases one and two were transposed accidentally with those for cases three and four respectively.

#### Ajax to Move Executive Offices

**NEW YORK, July 23**—The Ajax Rubber Co., Inc., has taken over the four-story building in West Fifty-seventh Street owned by the American Society of Civil Engineers. This will be altered considerably and used as the company's executive and general offices. The Ajax organization will move from 1796 Broadway to this building on Dec. 1.

#### To Study Hazards to Women in Industry

**WASHINGTON, July 22**—A committee has been appointed to investigate the special hazards to women in war industry. It will visit various centers where women are at work on war contracts and make investigation. The first trip will be to Niagara Falls, N. Y., to study the women's work in mechanical industries. The committee includes Lt. Col. Mock of the Surgeon General's office, Chairman, Capt. A. D. Reiley, Ordnance Department, Dr. Alice Hamilton, Department of Labor, and others from various governmental departments.

## Women Are Efficient in Metal Trades

National Industrial Board Report Shows Them Especially Valuable in Repetitive Work

BOSTON, July 23—The National Industrial Conference Board has just issued a report concerning the employment of women in the metal trades which summarizes data obtained from 131 metal working establishments employing a total of 335,015 men and 49,823 women. The main conclusion of the report is that the employment of women, in this branch of industry, has met with a high degree of success. In the plants from which data were received, women were for the most part employed on the lighter classes of work while men did the heavier work and that which required a high degree of skill. As has been evidenced almost everywhere that investigations have been made regarding the use of women in industries, they have been found most valuable on work of a repetitive character and on this kind of work, the report indicates, they were found to do better work and to turn out more of it than men. They are also given credit in the report for taking better care of their tools and being more steady and dependable. The opinions of most of those who furnished the Conference Board with information seemed to agree that the best methods of training women for metal work is provided by the vestibule school or by special classes at the factory where they are to work.

The principle of equal pay for equal work has been rather generally accepted among the manufacturers who reported. That women learn more quickly than men, especially the type of men that are now available, was pretty generally agreed to by the employers making returns. They are also considered to have a more wholesome attitude toward their work. In only eight plants was woman regarded as the inferior in this particular.

The report shows that in sixty-four establishments of the ninety-seven furnishing specific information on the relative output of men and women, and where men and women were employed on the same processes, the output of women was equal to, and frequently greater than, that of men. In only fifteen establishments was the output of women less than that of men on all operations on which both were employed. In the remaining eighteen their production, although less in some operations, equaled or exceeded that of men in others.

"A highly favorable account of the efficiency of women," says the report, "comes from an automobile plant where they are employed in twenty-three departments on assembling and inspecting materials and on many types of machine work. In this case the comparative output of women on identical processes was almost invariably greater than that of

*New collar insignia of the Air Division  
of the Signal Corps*

men, and in some cases quite disproportionately so. This establishment reported an instance where a woman employed on a nut tapping machine turned out at the end of her first week about double the output of the man working next to her. After endeavoring to equal her speed for a few days the man quit and was replaced by another woman, who is now very nearly the equal of the first.

"Whether technical training would make women the equal of men in work of higher character cannot be determined from available experience. It is noted, however, that there are certain operations which no employer reports as being performed as well by women as by men—for instance, lapping and brazing, both of which require considerable skill. Again women have not proved themselves the equal of men in such comparatively heavy work as chipping castings and machine filing.

"The permanence of women's position in the metal trades will depend in part on the attitude and economic strength of male workers after the war. Surprisingly little opposition to the introduction of women has thus far been encountered from men—possibly because of the relatively small number of women thus far employed or because the urgency of the step was recognized. Whatever the ultimate experience may be, the ability of women to perform a large variety of operations in the metal trades has been convincingly demonstrated."

### Curtiss Subsidiary in Atlantic City

ATLANTIC CITY, N. J., July 23—The Curtiss Flying Machine Co., a subsidiary of the Curtiss Aeroplane & Motor Corp., Buffalo, will establish an aircraft plant on the Inlet, where about 100 men will be employed. The company has received a contract from the Navy Department for seaplane parts.

### Gasoline Up One-Half Cent a Gallon

NEW YORK, July 20—The price of gasoline has been advanced one-half a cent a gallon in New York City and environs. The Standard Oil Co. has sent out notices to all its customers to the effect that beginning to-day the wholesale price is to be 24½ cents a gallon. The Gulf Refining Co. and the Texas Co. have both made a similar increase. The Tidewater Oil Co., which has refineries in New Jersey, has not yet advanced the price of gasoline, though an increase is looked for by dealers.

## Makers Constantly Change Plans

Manufacturers Unable To Tell  
What Will Happen Next—  
Conditions Unsettled

DETROIT, July 23—There has never been a time when it was more difficult for manufacturers to guess what will happen. Passenger car makers cannot plan for more than a week ahead. Frequently plans must be changed the next day and rearrangements are almost constantly being made due to the unsettled condition of the steel situation.

Already the majority of car manufacturers are below 33 1/3 per cent of their normal output and rapidly nearing the 25 per cent line. A number of them have reached a production equal to 25 per cent of their normal capacity.

The present coal scare is considered by some manufacturers as good propaganda as it has had its effect in frightening many into supplying themselves with fuel, and that otherwise they would have been lax in doing so. Never in the history of Detroit has so much coal been stored. This has taken many manufacturers out of the market and makes more fuel available for other purposes later.

### To Investigate Eastern Aircraft Plants

WASHINGTON, July 23—Attorney-General Gregory, William Frierson and Charles E. Hughes, who have been investigating aircraft production at Dayton, will return to Washington shortly. The next investigation will be at eastern aircraft factories, to be made within the next few weeks.

### A. A. A. Sanctions Chicago Speedway

CHICAGO, July 23—The Speedway Race to be held next Sunday, which will be sanctioned by the A. A. A., is to be a Class E, non-stop, special invitation, 5-cornered match race. There will be 4 heats, the distances of which have not yet been determined. The contestants are Ralph De Palma, Ralph Mulford, Louis Chevrolet, Arthur Duray and Dario Resta. The management has posted \$15,000 and each driver will post \$2,000. The total will be divided according to the points of each driver, dependent on his position at the finish.

### Dart Adds to Personnel

WATERLOO, IOWA, July 23—The Dart Truck & Tractor Corp. has made several additions to its forces. M. D. Millner has been added to the purchasing department. Frank Wermes has been appointed superintendent and production manager. The sales department has been increased by the addition of F. W. Kleist, formerly western manager of the Sheldon Axle Co.; John R. Williams, formerly assistant sales manager of the Velie Motors Corp., and Dwight L. Mink.

## Chicago Exposition Draws 90

### Makers Sign Up for Automotive and Accessories Exhibit on Municipal Pier

CHICAGO, July 23—Ninety exhibits have been secured thus far for the Automotive and Accessories Exposition which is to be held Sept. 14-21 on the Municipal Pier. The list follows:

S K F Ball Bearing Co. .... Hartford  
Hoosier Auto Parts Co. .... Muncie, Ind.  
A. F. and B. Specialty Co. .... Milwaukee  
Milwaukee Forge Machinery Co. .... Milwaukee  
Higgins Spring & Axle Co. .... Racine, Wis.  
Arrow Grip M. Co. .... Glenn Falls, N. Y.  
Clark Publishing Co. .... Madison, Wis.  
Indiana Mfg. Co. .... Indianapolis  
Carborundum Co. .... Niagara Falls, N. Y.  
Fordowner ..... Milwaukee  
Motor Vehicle Publishing Co. .... New York  
Essankay Products Co. .... Chicago  
U. S. Shaw Co. .... Chicago  
System on the Farm. .... Chicago  
Twin City Varnish Co. .... St. Paul  
H. G. Paro Co. .... Chicago  
Ekern Bros. Mfg. Co. .... Flandreau, S. D.  
Automotive Accessories Co. .... Baltimore  
Perfex Radiator Co. .... Racine, Wis.  
New Lite Lens Co. .... Chicago  
U. S. Auto Supply Co. .... Chicago  
Brown and Caine, Inc. .... Chicago  
Metal Specialties Mfg. Co. .... Chicago  
Geo. D. Bailey Co. .... Chicago  
Jefferson Electric Mfg. Co. .... Chicago  
Atlas Specialty Mfg. Co. .... Chicago  
The Reliance Co. .... Chicago  
Harry Newman ..... Chicago  
Advance Accessories Corp. .... Chicago  
Bailey Non-Stall Differential Corp. .... Chicago  
Milwaukee Auto Engine & Supply Co. .... Milwaukee  
The Zinke Co. .... Chicago  
Shurnuff Mfg. Co. .... St. Louis  
Romort Mfg. Co. .... Oakfield, Wis.  
Champ Spring Co. .... St. Louis  
Standard Underground Cable Co. .... Pittsburgh  
Metal Ware Corp. .... Chicago  
Burgess Mfg. Co. .... St. Joseph, Mich.  
Blake Mfg. Co. .... South Bend, Ind.  
Challoner Co. .... Oshkosh, Wis.  
Cooper Auto Specialty Co. .... Thomasville, Ga.  
Motor Car Equipment Co. .... New York  
The Duplex Engine Governor Co. .... Brooklyn  
Van Cleef Bros. .... Chicago  
Edelman & Co. .... Chicago  
Cummings Foster Corp. .... Chicago  
Perry Auto Lock. .... Chicago  
Defender Auto Lock. .... Detroit  
McIntyre Mfg. Co. .... Chicago  
The Dayton Wire Wheel Co. .... Dayton  
W. D. Sullivan. .... Chicago  
Dole Valve Co. .... Chicago  
Empire Auto Specialty Co. .... Chicago  
Koupet Auto Top Co. .... Belleville, Ill.  
Heinselman Bros. Co. .... Belleville, Ill.  
Presto Cloth Mfg. Co. .... Toledo  
Wood Hydraulic Hoist Body Co. .... Chicago  
A. A. Lawder Sons Co. .... Chicago  
The Wyman Sales Co. .... Chicago  
Baiso Oil Co. .... Toledo  
Baiso Oil Co. .... Council Bluffs, Iowa  
Agrimator ..... Chicago  
Falls Motor Corp. .... Sheboygan Falls, Wis.  
Buller Coupler Sales Co. .... Madison, Wis.  
Orange Judd Co. .... Chicago  
White Star Refining Co. .... Detroit  
American Manganese Steel Co. .... Chicago  
La Crosse Tractor Co. .... La Crosse, Wis.  
Hooven Radiator Co. .... Chicago  
Electric Steel Truss Wheel Co. .... Chicago  
Guaranteed Tractor Corp. .... Chicago  
Sumter Division, Splittorf Electrical Co. .... Chicago  
Commercial Truckmobile Co. .... Chicago  
One Wheel Truck Co. .... St. Louis  
Winther Motor Truck Co. .... Winthrop Harbor, Ill.  
Traffic Motor Truck Corp. .... St. Louis  
Hudford Co. .... Chicago  
Mechanical Belt Co. .... St. Joseph, Mo.  
K & D Lamp Co. .... Cincinnati  
New Era Specialty Co. .... Grand Rapids, Mich.  
Eclipse Valve Grinder Co. .... Kansas City  
Link Belt Co. .... Chicago  
Harding & Co. .... Chicago  
Anderson Electric Specialty Co. .... Chicago  
Atlas Auto Supply Co. .... Chicago  
N. A. Petry Company. .... Philadelphia  
Reflex Ignition Co. .... Cleveland  
Nilson Tractor Co. .... Minneapolis  
Forschler Motor Truck Mfg. Co. .... New Orleans  
Gray-Heath Co. .... Chicago

The products of the following companies will be exhibited in the Gray-Heath Co. section:

L. P. Halladay Co. .... Streator, Ill.  
New York Coil Co. .... New York  
A. C. Savidge Co. .... Indianapolis  
Cuno Engineering Corp. .... Meriden, Conn.  
Cole Gasoline Gauge Co. .... Chicago  
Wright Roller Bearing Co. .... Philadelphia  
Newton Horn Co. .... Brooklyn  
"X" Laboratories ..... Boston  
Hudson Motor Specialty Co. .... Philadelphia  
James P. Neerup Co. .... Chicago  
F. W. Oettinger Co. .... New York  
Lockfast Tire Carrier Co. .... Cleveland  
Standard Speedometer Co. .... Boston  
General Appliance Co. .... Boston  
Hansen Mfg. Co. .... Cleveland  
Gibraltar Jack Co. .... New York  
Halsted Mfg. Co. .... New York  
Bell Mfg. Co. .... Detroit  
Continental Piston Ring Co. .... Memphis  
A. E. White Machine Works. Eau Claire, Wis.  
Harris & Reed Co. .... Chicago  
Barcolo Mfg. Co. .... Buffalo  
Friden Mfg. Co. .... San Diego, Cal.

### Charge Unfair Competition Methods

WASHINGTON, July 22—The Goodyear Tire & Rubber Co. is charged with unfair methods of competition by the Federal Trade Commission. The company has been notified to appear at a hearing here Sept. 3. The complaint charges the Goodyear company of unfair methods by seeking special agreements with retail dealers to maintain standard resale prices on its tires, inner tubes and accessories. The company is further charged with an attempt to mislead the public in its nation-wide advertising of Goodyear service stations, these stations being, it is alleged, independent of the Goodyear company and maintained by dealers and dependent upon them. The service, it is declared, is furnished by dealers regardless of the makes of tires used by their customers.

It is charged that an arbitrary control over the business of dealers is maintained by threats of price discrimination which forces dealers to maintain excessive stock supplies of Goodyear products, to maintain standard prices for these, to report "underselling" by other dealers, and to specify Goodyear equipment on passenger cars, motor trucks and motor cycles which the dealers may handle.

It is further alleged that the company sells tires at dealers' prices direct to large truck users on condition that a fixed percentage, usually 90 per cent, of a company's monthly requirements be filled with Goodyear tires and supplies. Competing tire makers, it is set forth in the complaint, are injured in their business by these "unfair" practices, as are the dealers and the public.

The Goodyear attorneys and managers in New York state that an excellent defense exists against the charges and that many of the items mentioned in the complaint are quite common in merchandising generally.

### Crowther Plant Sold

ROCHESTER, July 23—The plant of the defunct Crowther Motor Car Co. has been sold to a Buffalo tire manufacturing concern. The new firm, which has been incorporated under the name of the Rochester Tire Corp., will begin work at once. The building is of the single-story type, 150 x 200, and has about 30,000 sq. ft. of floorspace.

## British Aviators to Fly Over West

### Brig.-General Lee To Head Demonstration Flight Over 16 Mid-West Cities

WASHINGTON, July 23—Brig. General Charles F. Lee, commanding the British Aviation Mission in this country, will make an airplane tour of the middle western states, assisted by Captains J. J. Hammond, James Fitz Morris, W. A. Hannay and G. E. Hunter. The tour will be a practical demonstration of aerial fighting. All of the officers engaged are distinguished members of the Royal Air Forces and have seen active service. They will start from Indianapolis on or about Aug. 14, and stop at 16 of the principal mid-western cities, making total air flights of 2500 miles. They will show the various air "stunts" and will point out in public talks the necessity for teaching advanced flying to our aviators.

Airplanes used will include a De Havilland fighting machine, a Bristol fighter and 2 British Avro training planes. It is also possible that some Sopwith Camels and S. E. 5's will be available as these are expected from abroad, and will be used if they arrive in time.

The itinerary will include air flights by at least 3 machines between Indianapolis, Cincinnati, Dayton, Columbus, Cleveland, Buffalo, Detroit, Toledo, Chicago, Milwaukee, Minneapolis, St. Paul, Des Moines, Omaha, Kansas City and St. Louis, probably in the order mentioned. Flights will be made over cities, the fliers going through aerial battle tactics and all the air antics known. The tour will extend through August and end early in September. Captain G. D. Hunter, R. A. F., has gone to Indianapolis to start a trip around the proposed circuit, making arrangements and selecting landing sites.

### Automotive Corp. to Make Royal Tractor

LOUISVILLE, KY., July 23—The Automotive Corp. has taken over the manufacture of the Royal tractor, and will start active production immediately at Napoleon, Ohio.

The Automotive organization, which recently purchased the assets of the Sun Motor Car Co., Elkhart, Ind., was organized in Delaware. The officers are: President, George G. King; vice-president, Robert Crawford, formerly president of the Sun Motor Car Co.; secretary and treasurer, William Hulin, formerly secretary and assistant treasurer of the Pan-American Motors Corp. C. W. Babcock, formerly associated with the Kelly-Springfield company, has been appointed manager of the truck department.

The Royal tractor has two wheels and is driven by means of a pair of lines in the same manner that a team of horses is driven. Kerosene is used for fuel, and the speed varies from 1½ to 8 m.p.h. The tractor will pull 14 plows and can be used with all present farm implements without any change.

## To Take Over Detroit Return Load Work

Transportation Association Has Been Formed to Sell Highway Haulage at Fixed Rates

DETROIT, July 22.—Selling highway transportation to shippers and consignees by the employment of highly trained investigators and the establishment of fixed rates for highway haulage between Detroit and points within a radius of 180 miles, are the outstanding objects of the Detroit Transportation Assn., which is being formed here by John F. Myers, formerly of the firm of Houghton & Myers, Inc., distributors of Stegeman trucks in the Detroit territory. This association may eventually prove to be the solution of the Return Loads Bureau idea as a permanent institution for the reason that it is attacking the problem of highway transportation where most of the Return Loads Bureaus have failed, viz., in selling highway transportation to the shipper of goods and to the consignee.

The membership of the new association will be made up of individuals and companies having either motor trucks or horse wagons to hire out. Private truck owners whose vehicles are idle for part of their time will also be eligible. The association will be financed by its members, who will pay certain sums as monthly and eventually yearly dues. These dues have not yet been determined, but will be decided upon by the number of members in the association, the idea being to set the dues at a figure which will just pay the operating expenses, but not form any sinking fund. Under this proposed plan of organization the larger the number of members, the smaller the dues.

More than thirty applications for membership in the association have already been received. It has been suggested that the monthly dues per member be \$20 a month, or \$240 a year, but this may be reduced if sufficient members are enrolled.

The new association will take over the work of the Detroit Return Loads Bureau, now handled by John F. McNally.

### Goodrich Has Training School

AKRON, July 22.—As part of the Government's plan to educate 90,000 men for specialized work in American universities this year the B. F. Goodrich Rubber Co. has provided a special classroom and working benches for the students. The men make daily tours of inspection through the tire-making departments; listen to lectures by department heads; repair tires that have been through every possible manner of abuse; learn how to demount and mount rims quickly; learn what to avoid in adjusting a rim to a wheel, and read manuals and books dwelling on the care and repair of tires.

The soldiers are drilled in quick and effective methods of repairing not only

automobile and motorcycle fabric tires but also cord tires for automobile and airplane use. This work is in co-operation with the University of Akron.

It is the plan of the Government to establish scores of American tire repair stations back of the lines on the Western front where American ambulances, officers' cars, Signal Corps cars, dispatch riders' motorcycles and all pneumatic tired vehicles and planes may instantly and efficiently have their "shoes" cared for.

### Makers Submit Headlamps for Test

ALBANY, N. Y., July 20.—Forty-three manufacturers of devices designed to control light emanating from headlamps have submitted their products to Secretary of State Francis M. Hugo for testing as provided under the new State law. Under the terms of this measure, such devices are to be tested and if they conform with the requirements of the headlamp law, a certificate of approval will be issued to the manufacturer. It is expected that the names of the manufacturers whose devices comply with the requirements will be made public in the near future.

### Ford Heads Labor Umpires

WASHINGTON, July 23.—Ten citizens appointed by President Wilson to act as umpires in labor controversies which cannot be settled by agreement of the members of the War Labor Board include: Henry Ford, Matthew Hale, Boston; James Harry Covington, Washington; Charles Caldwell McChord, Washington; V. Everit Macy, New York; Julian William Mack, Chicago; Henry Suzallo, Seattle; John Lind, Minneapolis; William R. Willcox, New York, and Walter Clark, Raleigh, N. C.

These men will settle the arguments between employers and employees when the War Labor Board is unable to reach that end. Up to this time there has been no need for such umpires, and the President's appointment is merely to meet a possible future problem of this kind.

### Truck Plant Being Enlarged

KENDALLVILLE, IND., July 22.—The Noble Motor Truck Corp. has purchased a site of 10½ acres on which a building will be erected that will add 140,000 sq. ft. of floorspace to the plant. The railroad spur has already been laid and building operations will begin soon. In the past the Noble truck has been manufactured in the 2-ton size, but as soon as the new addition is completed 1 and 3-ton trucks will also be turned out.

### To Double Service Truck Capacity

WABASH, IND., July 20.—The Service Motor Truck Co. has started work on two new buildings which will double the present floorspace of the organization.

## Electric Automobiles Unknown in Chile

Need Co-operation with Lighting Companies and Salesmanship to Popularize them

SANTIAGO, CHILE, July 19.—There are no electric automobiles in Chile. Despite the fact that Chile is a nation populated by 4,000,000 people who engage in farmwork and foreign trade throughout large cities where there are few hills and fair pavements, there are no electric automobiles to be seen, according to a pamphlet on "Electrical Goods in Bolivia and Chile," issued by the Department of Commerce.

Gasoline passenger car business is good and there are many agents, but none has ever attempted to push the electric, nor have the electric light companies offered encouragement in this direction. Conditions, states the report, are especially good in Santiago for the use of electric, as the streets are paved with asphalt or well-laid Belgian blocks and there is scarcely any grade. The central station has day circuits so that facilities for charging batteries could be easily arranged either in the home or at a garage.

The weather is ideal, for it never is cold enough to do any damage, the lowest temperature in 65 years being 26 deg. Fahr. The rainfall is not excessive, averaging only 15 in.

### Use Cars for Trucking

A number of secondhand gasoline passenger cars have been equipped with homemade bodies and are being used for trucking in competition with 2-wheeled ox carts. One of the mines operated by American capital uses 5-ton gasoline trucks which are the only automobile trucks in the country excepting a few used for demonstration purposes by large importing houses.

There is undoubtedly, the report states, a tendency toward the wide-spread development of this type of conveyance and it is possible that the electric car will benefit by the movement, but this cannot take place until an active campaign is begun to acquaint the people with what the electric automobile can do. On account of the absence of roads or boulevards in the country the gasoline car has not the advantageous position with respect to the electric which its long-distance touring radius gives it elsewhere. The two points in favor of the electric in the United States, namely ease of operation and cleanliness, do not apply in Chile, where the owner seldom drives. and it is only within the last year that women have driven cars at all. One point against the electric is the price, for with the same money or less one can buy a much larger gasoline car, and size is important because the large car looks imposing and because families are large.

In order to be successful in introducing electric vehicles it would be imperative

to have a live agent push them and get concessions from a lighting company in the matter of special rates for current. The agent would have to furnish expert help to keep the batteries in good condition as few people would understand them. If these conditions are complied with there should be a fair business in this line.

#### Making Poplar Propellers at Kelly Field

KELLY FIELD, TEX., July 20.—Poplar propellers instead of mahogany are being manufactured at Kelly Field. This is the only aviation camp in the country which makes its own propellers and is also the only one employing poplar.

Propellers made at Kelly Field are said to cost the Government less than 20 per cent of the price paid for them in buying from private concerns. Poplar contains less moisture than most of the other varieties of wood used for propeller making and is therefore better suited for a hot, dry climate where absorption of moisture often causes one made of other material to break. Eighty men are employed in the shop when it is operating at full capacity.

#### New Body Model for Stephens 76

FREEPORT, ILL., July 20.—A new 6-passenger body is in limited production by the Stephens Motor Branch of the Moline Plow Co. The body follows closely the lines of the former 4-passenger model but is longer, to accommodate two auxiliary seats. It is fitted to the same chassis as used in other Stephens models. The finish is in green with a fine gold stripe, and natural wood wheels. Among the refinements are Blackmore curtain openers, bullet lights, rear tonneau light, an electric light under the hood, accelerator foot rest, Johnston plate glass window in the rear curtain, dash gasoline gage, and oversize 33 x 4½-in. tires. The price is \$1,850, f.o.b. factory.

#### Ford Employees Laid Off

DETROIT, July 23.—The Ford Motor Co. has temporarily laid off 10,000 men, according to a report received here. Practically all of these were employed in the passenger car division.

## Settle Army Truck Program

White 1½-Ton Model Substituted for Original A—¾-Ton G. M. C. to Be AA

WASHINGTON, July 22.—The White 1½-ton truck, manufactured by the White Co., Cleveland, Ohio, will replace the original A, 1½-ton standardized Army truck, developed by the Quartermaster's Department, according to authoritative advice received by AUTOMOTIVE INDUSTRIES. This announcement definitely settles the three standard Army trucks program which will include for the AA the G. M. C. ¾-ton truck, for the A the White 1½-ton truck, and for the B, the original B 3-ton heavy duty war truck.

It is understood that the White truck will be known as the A truck and will undergo certain changes in its specifications similar to those made in the AA and recently announced. No decision has been reached as yet as to the quantity of A trucks to be ordered, and bids have not been requested of the manufacturers. Major Brown, of the Motor Transport Service, in charge of this work, is making a trip through the middle West partly to determine the manufacturing possibilities for the A truck.

These decisions definitely settle the Army truck program, and point to a victory on the part of those who were opposed to the original standardized truck plans. It will be recalled that earlier there was considerable opposition on the part of certain standard truck makers to the first scheme, whereby standard ¾-ton, 1½-ton and 3-ton trucks designed by engineers called to Washington, were to form the bulwark of the United States Army Motor Transport Service. There was opposition created by some who felt that the original A and AA trucks were not mechanically correct, and by others who preferred to see their own trucks used by the army.

There was much feeling displayed on both sides for a time. The disagreement resulted in a reorganization of the Motor Transport Section into the new Motor

Transport Service under Colonel Fred Glover, and in a series of tests ordered by Secretary of War Newton D. Baker. It is said that the selection of the G. M. C., the White and the original B trucks are the result of these tests although persons on each side of the controversy claim that the tests were not complete enough or of long enough duration to secure adequate results.

#### 219,292 Passenger Cars in Michigan

LANSING, July 23.—Michigan had 219,292 licensed passenger cars on July 1, according to figures given out by the automobile division of the State department. In addition, there were 23,420 commercial vehicles, 6505 motorcycles, 561 dealers' licenses, 19,420 chauffeurs and 5446 transfers to other owners during the first half of the calendar year.

The license fees on the same date had reached a total of \$2,689,490, of which \$1,311,712 went to the counties in which the cars were owned, for good roads, while the balance went into the state highway fund. During the first quarter the money collected was \$1,587,172, and the second quarter, or since April 1, \$1,102,318.

#### Sanford Price Increased

SYRACUSE, N. Y., July 20.—The Sanford Motor Truck Co. has advanced the price of its 3½ and 5-ton trucks, effective Aug. 1, as follows:

Model	Old Price	New Price
W-35, 3½-ton.....	\$3300	\$3975
W-50, 5-ton.....	4600	4750

#### Ford Tractor Assn. Formed

DEARBORN, MICH., July 22.—For the purpose of discussing future policies of distribution and deciding the question of parts, distributors of Fordson tractors met in Des Moines, Iowa, on July 10. Representatives of forty-five states were present. All distributors agreed to sell parts at uniform prices regardless of the states in which they were located. As a result of this meeting the Ford Tractor Assn. was organized. C. L. Herring of Des Moines was elected president, C. L. Flint of Providence secretary, and C. H. Northway of New York treasurer.

#### Ford Notes to Be Bought

DETROIT, July 22.—The Auto Investment Co. has been formed by local business men for the purpose of buying notes given for the purchase of Ford cars. Under the plan, customers can purchase used Ford cars on liberal terms and provide the dealers the means of disposing of their customers' notes. Officers of the company are: President, Charles R. Talbot, vice-president of the National Bank of Commerce; vice-president, Paul Meyer, general manager of the Detroit Sales Co.; secretary and treasurer, Maurice W. Fox, president of the Maurice W. Fox Co.

The new six-passenger Stephens Salient Six Model. This is built on the lines of the four-passenger model, but is longer to accommodate two auxiliary seats

## Motor Transport Service Spends 15% of All Money

(Continued from page 161)

ered to the Government to date. They are being turned out at the rate of 75 a day. The original program called for the production of 10,000 trucks by Aug. 1, but a serious delay in the delivery of engines and axles has prevented completion of the program as planned. It is now expected that all of the axles will have been delivered by Aug. 15 and possibly the engines by that same date. The delivery of the first 10,000, it is anticipated, will be completed by Sept. 15. Lieutenant Colonel Edwin S. George, who has been in charge of the procurement and purchasing of the Motor Transport Service since its inception, has been promoted to a colonelcy, and now is the second highest ranking officer in the Service under Colonel Glover.

### More Lightless Nights Ordered

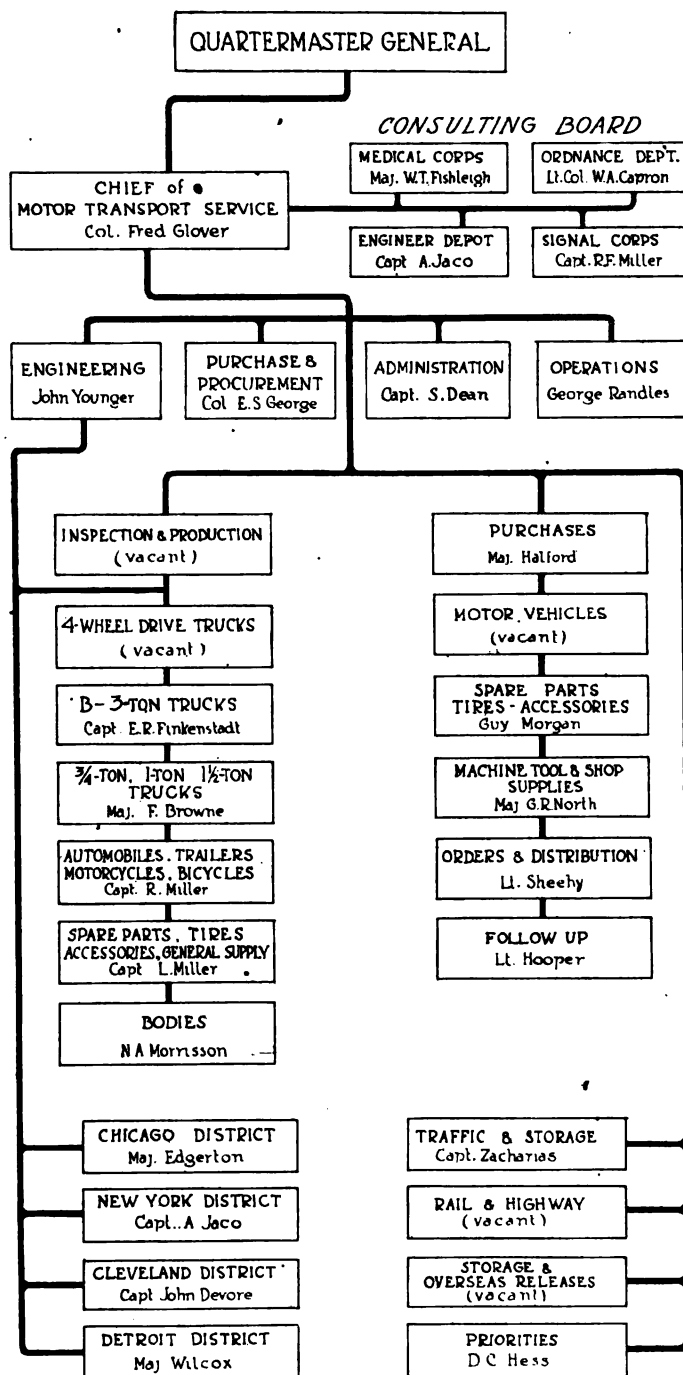

WASHINGTON, July 22—Lightless nights, effective July 24, are ordered by the Fuel Administration for an indefinite period. The order prohibits the use or consumption of coal, gas, oil or other fuel for illuminating or displaying advertisements, announcements or signs, or for the external ornamentation of any building on Monday, Tuesday, Wednesday and Thursday nights of each week in New England and the States of New York, Pennsylvania, New Jersey, Delaware, Maryland and the District of Columbia. The order also applies on Monday and Tuesday of each week in all remaining states. The order excepts only bonafide roof gardens, outdoor restaurants and outdoor moving picture theaters. Illumination or display by night in shop windows or any signs in show windows will be discontinued from sunrise to sunset and discontinued entirely on the lightless nights designated by the order. Street illumination will be reduced to that amount necessary for safety.

It is anticipated that 500,000 tons of coal a year will be saved by this plan.

### Truck Service Operating on Schedule

DETROIT, July 22—The Inter-City Trucking Service, Inc., recently formed, is operating daily express service between Detroit, Flint and intermediate points. Operating 3-ton Denby trucks, the company sends out trucks from Detroit and Flint every morning, Sundays excepted, which pick up and deliver freight between the two cities.

Centrally located receiving stations are maintained in the larger towns, where shippers may send consignments at any time. Connections with other motor delivery companies in the state enable the Inter-City company to receive freight and guarantee delivery to many points in Michigan not covered by its own route.

Plan of organization of Motor Transport Service

### Official Telegrams by Red Cross

WASHINGTON, July 23—The American Red Cross Motor Car Service, which includes more than 6000 women, will carry the official telegrams containing information regarding overseas casualties to the homes of the relatives of the killed or wounded. The original khaki uniform of this service has been discarded and replaced by a new regulation uniform of the Red Cross Oxford gray. Commanders will wear three silver diamonds embroidered on their shoulder straps. Captains will wear two silver diamonds, first lieutenants one, and second lieutenants a gilt diamond. Pearl

gray tabs on the collar will indicate staff officers. Service stripes will be worn on the sleeves.

As a result of a conference recently held in Washington at the call of the director of the Bureau of Motor Corps Service, the motor service in six of the principal cities of the country which previously had been independent in its organization, was amalgamated with the Red Cross Corps. This makes the Red Cross Motor Corps Service a thoroughly co-ordinated institution, able to meet the local and interlocal demands for transportation throughout the land on a nationalized basis.

## 52 Manufacturers at Salina

### French Commission to Attend— S. A. E. to Stage Tractor Conservation Dinner

SALINA, KAN., July 22.—The list of exhibitors for the National Tractor demonstration which is to be held here July 29-Aug. 2, is practically complete, and includes 52 manufacturers of tractors and implements and 27 manufacturers of accessories.

A commission representing the French Government has made reservations at demonstration headquarters, and will remain throughout the week collecting data. It is expected the commission will include Lieut. Mattaine and Mr. Chace.

The Society of Automotive Engineers will hold a tractor conservation dinner at the Hotel Lamer on Wednesday, July 31, at 8 p. m. This dinner will be the big get-together of demonstration week, and it is expected that there will be a very large turnout. Following the dinner there will be seven or eight 20-minute talks by leading tractor engineers and manufacturers on pertinent subjects. The aim is to stage a dinner similar to the Orville Wright dinner recently held at Dayton, where aviation subjects were handled so successfully. Dinner tickets are \$2.50 each.

Following is the complete list of exhibitors to date:

#### Tractors and implements

Advance-Rumley Thresher Co.	LaPorte
American Tractor Co.	Peoria
American Ford & Tractor Co.	Oklahoma City
Aultman & Taylor Co.	Mansfield
Avery Co.	Peoria
Beeman Cardon Tractor Co.	Minneapolis
Bull Tractor Co.	Minneapolis
Bullock Tractor Co.	Chicago
Case T. M. Co., J. I.	Racine
Case Plow Works	Racine
Cleveland Tractor Co.	Cleveland
Dart Motor Co.	Waterloo
Dauch Mfg. Co.	Sandusky
Deere & Co.	Moline
Electric Wheel Co.	Quincy
Emerson-Brantingham Co.	Rockford
Ford, Henry, & Son	Dearborn
Four-Drive Tractor Co.	Big Rapids
Frisk Co.	Waynesboro
Grand DeTour Plow Co.	Dixon
Gray Tractor Co.	Minneapolis
Guaranteed Tractor Co.	Chicago
Hart-Parr Co.	Charles City
Hessian Tiller & Tractor Co.	Buffalo
Holt Co.	Peoria
Interstate Tractor Co.	Waterloo
International Harvester Co.	Chicago
Joliet Oil Tractor Co.	Joliet
LaCrosse Tractor Co.	LaCrosse
LaCrosse Plow Co.	LaCrosse
Lyons-Atlas Co.	Indianapolis
Lamson Tractor Co.	New Holstein
Moline Plow Co.	Moline
National Tractor Co.	Peoria
Nilsson Tractor Co.	Minneapolis
Parrett Tractor Co.	Chicago
Peoria Tractor Co.	Peoria
P. & O. Tractor Co.	South Bend
Port Huron Engine & Thresher Co.	Port Huron
Rock Island Plow Co.	Rock Island
Roderick Lean Mfg. Co.	Mansfield
Russell Co.	Massillon
R. & P. Tractor Co.	Alma
Simplex Straw Spreader Co.	Kansas City
South Bend Chilled Plow Co.	South Bend
Square Turn Tractor Co.	Norfolk
Three P. Auto Tractor Co.	Davenport
Turner Mfg. Co.	Port Washington
Vulcan Motor Corp.	Moline
Vulcan Mfg. Co.	Evansville
Wallis Tractor Co.	Racine
Waterloo Tractor Co.	Waterloo

### Liberty Plane Poster for Cadillac Workers

*Men engaged in the airplane division of the Cadillac Motor Car Co. are constantly impressed with the patriotic nature of their work. Huge posters with patriotic appeals are published periodically and hung on the walls throughout the shops*

## The Bird that will Wing the Kaiser

The De Havilland Four, the type of airplane for which most of the Liberty Motors will be used, is the fastest airplane in the world, according to Theodore M. Kappin, industrial correspondent of the New York Tribune. Mr. Kappin's report says in part:

"I have all the flying data. I have all the engineering data, and I have all the data of the airplane itself, and I have all the data of the airplane itself, and I have all the data of the airplane itself."

"The Liberty Motor is a great reinforcement to the Allied armaments of the war, and it is a great reinforcement to the Allied armaments of the war, and it is a great reinforcement to the Allied armaments of the war."

"It is a great reinforcement to the Allied armaments of the war, and it is a great reinforcement to the Allied armaments of the war, and it is a great reinforcement to the Allied armaments of the war."

"America was late, but America has not lost."

"We are on the verge of a tremendous production. Cadillac and her corps of loyal workmen have responded nobly, but there is much yet to be done. Our part of this great program calls for our best—our brains, our skill, our strength, our patriotism, and our manhood. Let's give all these to the limit and help hand the Hun the finishing wallop."

CADILLAC MOTOR CAR COMPANY

#### Accessories

American Manganese Steel Co.	Chicago
Bosch Magneto Co.	New York
Buda Motor Co.	Harvey
Byrne-Kingston Co.	Kokomo
Champion Spark Plug Co.	Toledo
Automotive Parts Co.	Indianapolis
Diamond Chain Co.	Indianapolis
Hyatt Roller Bearing Co.	Chicago
McQuay-Norris Mfg. Co.	St. Louis
Modine Radiator Co.	Racine
Timken Roller Bearing Co.	Canton
Spittdorf Electric Co.	Chicago
K-W Ignition Co.	Cleveland
Hooven Radiator Co.	Chicago
Vacuum Oil Co.	New York
Nuttall Co., R. D.	Indianapolis
Gurnee Ball Bearing Co.	Jamestown
Remy Electric Co.	Chicago
SKF Ball Bearing Co.	Hartford
Oakes Co.	Indianapolis
Domestic Engineering Corp.	Dayton
Lalley Light Co.	Detroit
Mutual Oil Co.	Kansas City
U. S. Ball Bearing Co.	Chicago
Universal Light Co.	Salina
Alamo Light Co.	Omaha

#### Cadillac Making Census of Employees

DETROIT, July 23—The Cadillac Motor Car Co. is taking a census of its employees and classifying each person according to the character of work he can do. When the investigation is completed all the names will be placed in a card index under the proper classification. Each name will appear as many times as the number of different kinds of work he is fitted for. In other words, if a man is fitted for. In other words, if a man is a drill press operator and also can operate an "Acme" screw machine, he is listed under both classifications, thus enabling the company to put its hands on all the operators of a certain kind at one time.

It has been brought to the attention of the officials of the company frequently where one man could be fitted in several various positions. By means of the information gathered in the census, the company, if necessary, can transfer men from one department to another, thereby placing them where they are most needed. The census has already revealed places where men can be released for more important work and replaced by women.

#### Cleary to Handle Cadillac Advertising

DETROIT, July 23—Due to the resignation of L. N. Burnett, advertising manager of Cadillac Motor Car Co., who has joined the colors, John A. Cleary has been called from Philadelphia to take charge of the advertising department until more definite arrangements can be made. He has been handling the advertising of the eastern distributors.

#### Chevrolet to Vacate New York Plant

NEW YORK, July 23—The Chevrolet Motor Co. will vacate its manufacturing plant in New York City about Sept. 1. The entire equipment is to be removed to the Tarrytown, N. Y., plant and manufacturing activities for eastern territory centered there. The principal offices, however, will remain in New York at Broadway and 57th Street.

## Men of the Industry

*Changes in Personnel and  
Position*

### Marathon Executives Enlist in Army

CUYAHOGA FALLS, OHIO, July 20.—Three of the executives of the Marathon Tire & Rubber Co. have joined the colors. Secretary Raymond D. Jenks has enlisted in the Gas Defense Service at Washington and reports for duty at once; Purchasing Agent Russell Farley has enlisted in the Ordnance Department and is stationed at the Rock Island Arsenal. Floyd R. Biggs, factory representative in Kansas City, has enlisted in the infantry service.

C. F. Batchelder, for the last 2 years assistant sales manager of the Dort Motor Car Co. and for 10 years previous sales manager of the John Deere Plow Co., St. Louis, has been appointed eastern division sales manager of the Olds Motor Works, Lansing. He succeeds N. W. Barton, who has been transferred to New York City with the Oldsmobile Co. of New York.

George L. East has resigned as assistant sales manager of the Olds Motor Works, Lansing, Mich., to become associated with the Gulf Oldsmobile Co., New Orleans, in the distribution of the Oldsmobile throughout Louisiana. His connection with the Olds company dates from 1907, and includes 5 years as advertising manager, several years as wholesale representative, and 1½ years as assistant sales manager.

Homer Beckenbach, formerly assistant sales manager of the Cleveland branch of Willys-Overland, Inc., has entered Government service as inspector in the drop-forging department of the Ordnance Department in Detroit.

E. F. Howells has been appointed district sales manager for the Sanford Motor Truck Co., Syracuse. His territory will include New York and Pennsylvania. He was formerly Philadelphia manager for the Chase Motor Truck Co.

George C. Whitman has joined the Oakland Motor Car Co. as social service director. He will formulate plans for the betterment of working conditions among the employees.

George Woelfel, Jr., formerly secretary to Commissioner William M. Webster of the National Assn. of Automobile Accessory Jobbers, has joined the Zinke Co., Chicago, as special representative.

H. O. Penland, sales engineer of the U. S. Ball Bearing Mfg. Co., Chicago, with headquarters in Cleveland, has been pro-

moted to the managership of the company's Cleveland office.

Warren A. Maxwell, son of S. W. Maxwell of the Michigan State Automobile School, Detroit, and formerly associated with the Detroit service branch of the Studebaker Corp., has received a commission as second lieutenant in the Aviation Section of the army.

E. F. Sullivan has been appointed chief engineer of the Homer-Laughlin Engineers Corp., Los Angeles. He will design a small creeper-type tractor which will be shown in the September demonstration.

M. H. Breeze, formerly publicity manager for the B. F. Goodrich Co. and associated with that company's Cleveland branch, has resigned and has joined the Metal Parts Co., Detroit.

### Fisk Export Manager Starts on Trip

NEW YORK, July 16.—John B. Maus, export manager of the Fisk Rubber Co., has sailed on an extended business and research trip through Latin-American countries, and will be gone for a year or longer. His itinerary embraces Cuba, Chile, Peru, Bolivia, Ecuador, Argentina, Brazil, Uruguay and the north shore of South America, as well as Central American colonies.

### Diamond-T Distributors Changed

MILWAUKEE, July 20.—Distribution of Diamond-T trucks in the State of Wisconsin has changed hands through the sale of the agency by John H. Ryan to the Upham-Schacht Co. Ryan will continue to distribute in the states adjacent to Wisconsin from new headquarters in Minneapolis and St. Paul.

### Goodyear Branch Managers Transferred

AKRON, OHIO, July 22.—The Goodyear Tire & Rubber Co. has made several changes in its personnel of branch managers. L. C. Alexander, formerly supervisor of salesmen for the Indianapolis district, has been appointed manager at Cincinnati, succeeding E. G. Shick, promoted to the automobile tire department at Akron. J. S. Taylor, formerly sales supervisor of the Southern district, is now manager at Jacksonville, Fla., succeeding J. J. Kendall, now in the Federal service. H. C. Davies is acting branch manager at Dallas, Tex., replacing R. S. Brace, also in the Federal service. J. M. Dine, formerly branch manager at Omaha, has been appointed assistant manager at the Chicago branch, and C. A. Cramer, formerly manager at Cedar Rapids, has succeeded him at Omaha. E. L. Luthy has been promoted from supervisor of sales at Chicago, to branch manager at Cedar Rapids.

### Floyd Robinson Dies

DETROIT, July 20.—Floyd M. Robinson, former advertising manager of the Regal Motor Car Co., Detroit, and later with the Marion-Handley Co., Jackson, Mich., in the same capacity, is dead.

## New Companies Formed

*Latest Additions to Ranks of  
Automotive Industries*

### Gillette Men Form New Rubber Company

EAU CLAIRE, WIS., July 22.—Interests identified with the active ownership and management of the Gillette Rubber Co. have organized the Chippewa Rubber Co. to engage in the manufacture of rubberized fabrics of all kinds, principally waterproof covers, hospital sheeting, rubber coats and similar goods. A 2-story factory adjacent to the Gillette plant is being completed and will be ready to start regular production Sept. 1. From 75 to 100 men and girls will be employed at the start. The Gillette and Chippewa companies are distinct and separate. Officers of the new company are: President, Edward Hutchens; vice-president and general manager, E. C. Gavin; second vice-president, J. J. Ott; secretary, R. B. Gillette; treasurer, S. B. Woodward, New York. The capital stock is \$250,000.

### To Make Puncture-Proof Tire

MILWAUKEE, July 22.—The Everwear Rubber Co., which was organized a short time ago with an authorized capital stock of \$200,000, will manufacture a substantially punctureless, no-blowout, inner tire of a new type. The company has purchased all patent rights, which were granted to the inventor Jan. 12, 1918. The inner tire is of the pneumatic type, but is protected by a cellular cushion hoop separating the tube from the casing.

### Dependable Truck & Tractor Formed

GALESBURG, ILL., July 22.—The Dependable Truck & Tractor Co. has been organized here for the manufacture of commercial vehicles, and is now seeking a suitable factory. Officers have been elected as follows: President, C. V. Morse; vice-president, H. C. Pfaff; secretary-treasurer, J. J. Welch. A. E. Patchin has been appointed sales and advertising manager. With the exception of Welch, all the officers were until recently associated with the Pan-American Motors Corp., Decatur, Ill.

### To Make Marco Speed Recorder

EAST MOLINE, ILL., July 22.—The Motor Appliance Co. has been organized here to manufacture automobile appliances, and has taken over the plant of the Ogden Mfg. Co. at Plymouth, Ind. Three specialties will be featured. These are the Marco speed recorder, which records instantly the exact rate of speed made per hour, the total number of miles traveled and the number of stops; the Benson automatic speed signal, and Ogden automobile parts.

## Janesville Machine Co. Reorganized by G. M. C.

JANESVILLE, WIS., July 22.—The reorganization of the Janesville Machine Co., manufacturer of farm machinery, under the direction of the General Motors Corp., which recently acquired the controlling interest, has been completed. The capital stock of \$2,250,000 has been divided into 12,500 shares preferred and 10,000 common shares. The former capital was \$750,000. Officers have been elected as follows: President, J. A. Craig; first vice-president, A. P. Lovejoy; second vice-president, G. V. Sullivan; treasurer, M. G. Jeffris; secretary, E. B. Davis. Mr. Craig was general manager of the company under the former ownership. General Motors made a deposit of \$1,095,000 in the First National Bank of Janesville on the day the transfer was formally made.

### To Auction Detroit-Wyandotte Plant

WYANDOTTE, MICH., July 20.—The plant of the defunct Detroit-Wyandotte Motor Truck Co., consisting of one building, 300 x 60, of approximately 40,000 sq. ft., will be sold at auction on the premises by Samuel L. Winternitz Co., Chicago.

### To Double Allen-Bradley Capacity

MILWAUKEE, July 22.—The Allen-Bradley Co., manufacturer of rheostats, electric controlling devices, and charging sets for storage battery and electric vehicle work, is doubling the capacity of its plant by the erection of a 3-story addition and adding several stories to the present main shop.

### Teetor-Hartley Gets Government Order

HAGERSTOWN, IND., July 22.—The Teetor-Hartley Motor Corp. has received a contract for exhaust manifolds to be used in the new engines which will be installed in tanks. The first order calls for 1500 manifolds.

### Walden-Worcester Opens Chicago Branch

WORCESTER, MASS., July 20.—The Walden-Worcester, Inc., manufacturer of Walden-Worcester wrenches, has opened a branch office in Chicago. It will be under the supervision of Messrs. Craig & Opdyke.

### War Contracts for Edison Industries

NEW LONDON, WIS., July 22.—The Wisconsin plant of Thomas A. Edison Industries, Inc., is completing a contract for approximately 135,000 sq. ft. of airplane construction material for the British Government. Delivery is to be made by Aug. 15. The material consists of panels of 3-ply veneer, the outer plies being of birch and the filler-ply of basswood. It is said to differ materially from this Government's requirements for such material. The New London plant is also manufacturing 20,000 trunk-type filing cases for the U. S. Government for the use of the army in the field.

## Current News of Factories

*Notes of New Plants—Old  
Ones Enlarged*

### Hayes-Ionia Expands Plant

GRAND RAPIDS, July 15.—The Hayes-Ionia Co. has completed a 3-story addition to its plant. A short time ago the company took over the plant erected by the Nelson-Matter Furniture Co., moving its general offices from Ionia, Mich. The plant at Ionia is still in operation. More than 1700 men are employed in the two factories, the local plant having the greater number. The two factories have a floorspace of more than 600,000 sq. ft.

### Capital Increase

The Deitrich Motor Car Co., Youngstown, Ohio, has increased its capital stock from \$15,000 to \$25,000.

### Dividends Declared

The Michigan Drop Forge Co., Pontiac, Mich., has declared the July dividend of 20 cents a share upon the common stock, payable Aug. 1 to holders of record July 15.

The Russel Motor Car Co., Toronto, has declared its regular quarterly 1½ per cent dividend on preferred stock, payable Aug. 1. A dividend of 7 per cent on common stock, payable Aug. 1, has also been declared.

The Grant Motor Car Corp., Cleveland, declared its regular quarterly 1½ per cent dividend on preferred stock, payable Aug. 1.

The Falls Motors Corp., Sheboygan Falls, Wis., has declared its regular quarterly dividend of 1½ per cent on preferred stock and a dividend of 5½ per cent in scrip on preferred stock, both payable July 20.

The Packard Motor Car Co., Detroit, has declared a cash dividend of 2 per cent on common stock, payable July 31, to stockholders of record July 15.

The Kelly-Springfield Tire Co. has declared a dividend of \$1 a share on common stock, payable Aug. 1 to stock of record July 15.

The Fisher Body Corp. has declared a regular quarterly dividend of 1½ per cent on preferred stock, payable Aug. 1 to holders of record July 23.

The Chevrolet Motor Co. has declared a quarterly dividend of 3 per cent, payable Aug. 1 to stock of record July 15.

The General Motors Corp. has declared quarterly dividends of 3 per cent on common and 1½ per cent on preferred stock, payable Aug. 1 to holders of record July 15.

The Michigan Drop Forge Co., Detroit, has declared an extra dividend of 10 cents a share on the common stock, payable July 25.

## Bosch Plainfield Plant to Be Occupied by Wasson

NEW YORK, July 20.—The Plainfield, N. J., plant of the Bosch Magneto Co., which, as was told in AUTOMOTIVE INDUSTRIES last week, has been purchased by the Wright-Martin Aircraft Co., is to be occupied by the Wasson Piston Ring Co., which will remove its equipment from New Brunswick, N. J., and turn over its plant to the Wright-Martin company. This will give the Wright-Martin company an additional plant in New Brunswick and will permit considerable expansion. The company is at present producing about 500 engines a day in its New Brunswick plant and about 40 engines a day in the Long Island City plant. Much new machinery was purchased last week.

### Traffic Trucks To Be Shown at Chicago

ST. LOUIS, July 20.—The Traffic Motor Truck Corp. will make the first public exhibition of its 2-ton trucks at the Automotive and Accessory Exposition in Chicago, Sept. 14-21. It is stated that the company is producing at the rate of 300 trucks a month.

### Women Drivers Used at Buick

FLINT, MICH., July 22.—The Buick Motor Co. is using women to drive cars from the assembling plant to the loading platform, and the company says that the plan is working out excellently. Fourteen women are doing the work, and their duties are confined merely to the driving of cars. Besides driving from the assembling plant, the women also take the cars from the warehouse to the company's garage to be delivered to dealers who come to drive cars away. They are well satisfied with this work and are performing their duties as well as the men they superseded, according to an official of the company.

### Automotive Battery Corp. Takes Prest-O-Lite Service

BOSTON, July 13.—The Automotive Battery Corp. has been formed here to take over the service of Prest-O-Lite products in this vicinity. James MacKenzie, formerly in charge of the Willard battery interests at Springfield, Mass., and later purchasing agent at the Watertown Arsenal, is president and general manager. George Bradburn of the Bradburn Motors Co. is treasurer. The company has leased quarters at 701 Beacon Street and has plants at Cambridge and Springfield. J. A. O'Donnell, manager of the Prest-O-Lite branch, retains his position as representative of the factory in New England.

### Sales Increase 100 Per Cent

KENT, OHIO, July 20.—Sales of the Mason Tire & Rubber Co. for June were \$302,123. This is an increase of more than 100 per cent over June, 1917.

# Industrial Review of the Week

## A Summary of Major Developments in Other Fields

### Coal Production Records Touch New High Level

Production records in the bituminous fields are being smashed. Coupled with the cheering news of the victories of our boys and the Allies at the Marne, the successful onslaught on the storehouse of Mother Nature by the mining forces at home furnishes cause for a new song of jubilation. Every soft-coal region is reporting greater output than ever before. For the week ended July 13 the total of bituminous coal shipped from the mines amounted to 13,243,000 net tons, which is more than a million tons above the average weekly requirements set by the Fuel Administration as necessary to meet essential demands. The average weekly production of soft coal from April 1 to date, however, is estimated at 11,568,000 net tons. Therefore, to make up the total deficit of 9,615,000 net tons which now exists it will be necessary to have approximately ten more weeks of production equivalent to that of the week ended July 13, or an output of 12,472,000 net tons during each of the 37 weeks remaining in the coal year, which ends March 31, 1919. During the week under review shipments of anthracite amounted to 42,331 cars, which shows a slight improvement over the forwardings of recent weeks.—*Coal Age*.

### Need of Truck Makers For Steel

(Continued from page 134)

"We are led to believe that for every million men sent to the war front, something between 30,000 and 50,000 trucks will be required.

"It is also suggested that the United States Government will eventually use a large number of trucks at home.

"In order that motor truck plants may be kept up to their top efficiency, and their personnel maintained intact, so that they may meet any demands an enlarged program will make on them, it is necessary that these plants be kept alive in the interval.

"This is only possible through domestic business. Not enough war work is in sight as this time. The domestic business is a hand, and discharges a patriotic utility.

"There seems therefore every reason why the War Industries Board should class motor trucks with such other transportation utilities as locomotive engines, freight cars and steamships, find a means to issue the same priorities that go to war necessities, and see that the necessary materials are available in order that motor truck production be not interrupted.—National Motor Truck Committee of the N. A. C. C."

### Government Places Demands Before Steel Manufacturers

More impressively than in any previous week the Government has put before the steel producers the demands it will make upon the country's capacity in the next six months and the still greater needs of 1919.

It is now realized that the ship program is to be increased next year beyond anything yet believed, that railroad purchases must far exceed those for 1918 after years of starvation buying, and that shell steel must be furnished at a 5,000,000-ton rate. Moreover, the strain great crops have always put upon iron and steel capacity is also to be reckoned with now.

In its third warning to consumers of steel within three months the War Industries Board put the needs of the second half of the year for war and essential industries at 20,000,000 tons of finished steel products, or 3,500,000 tons more than the expected output. A sharp challenge of the 20,000,000-ton estimate came from automobile interests.

No assurance has been given, nor can it be given, the most certain thing in the prospect being that the use of steel for war purposes will increase, while increased production is less likely.—*Iron Age*.

## Summary of General Business Conditions as of June 23, 1918

Following is a Summary of Business Conditions on June 23, as Reported to the Federal Reserve Board:

District	General Business	Crop Condition	Industries of the District	Construction, Building, and Engineering	Foreign Trade	Money Rates	Railroad, Post Office, and Other Receipts	Labor Conditions
No. 1—Boston	Active	Average, promising	Busy	Decreased	Increased	Steady and strong	Mixed	Scarce; wages high
No. 2—New York	Very active	Good	Engaged to full capacity; widespread adaptation of production to war essentials.	Dull, except for construction of Army warehouses, shipyards, housing for Government labor and factory construction.	Many restrictions, but large aggregate.	Firm and steady	Post office increase, 19.28 per cent over last year; railroads show increase in gross and decrease in net earnings.	Scarcity and high competitive wage offers, resulting in large turnover.
No. 3—Philadelphia	Very good	Excellent	Very busy	Very little new building.	Large	Firm; no change	Gross receipts increasing.	Shortage acute in all lines.
No. 4—Cleveland	Good	Satisfactory and promising	Busy	Very dull		Increasingly firm	Increase	Unsatisfactory; scarcity.
No. 5—Richmond	Active, limited only by labor and supplies.	Excellent	Active, profitably employed.	Private building negligible; Government work active.	Limited by freight room.	Six per cent; heavy demand and increasing.	Railroad irregular; post office, volume large; reflects increased rates.	Inadequate; unsatisfactory.
No. 6—Atlanta	Good	Very satisfactory	Busy	Inactive	Unsatisfactory	Firm	Post office receipts decrease under last month.	Unsettled.
No. 7—Chicago	Very active	Excellent	Generally at capacity.	Dull		Do	Increase in postal receipts.	Very scarce.
No. 8—St. Louis	Good	Do	Active	Do		Do	Not much change	Nearing settlement.
No. 9—Minneapolis	Do	Do	Do	Fair		Very firm		Good.
No. 10—Kansas City	Do	Good to excellent	Do	Slightly improved		Firm		Equalization of farm demand and supply.
No. 11—Dallas	Quite satisfactory	Fair to good	Do	Building activities below normal; Government work has right of way.	As satisfactory as shipping space available permits.	Firm, heavy demand but slight evidence of increase.	Railroad increase and higher tariffs not noticeable in travel; post office increase.	Unsatisfactory; shortage in all branches.
No. 12—San Francisco	Active	Good	Do	Operations generally curtailed.	Increase	Firm	Increasing	More settled.

## General Engineer Contracts

WASHINGTON, July 17.—The following contracts have been awarded by the General Engineer Depot, War Department:

July 8, 1918.

American Lubricator Co., Detroit; steam lubricators.

Diamond Chain & Mfg. Co., Indianapolis; links, motor chains.

Gray Motor Co., Detroit; gasoline engines.

July 9, 1918.

Gray Motor Co., Detroit; spare parts for gasoline engines.

Goodyear Tire & Rubber Co., Philadelphia; hose, suction.

Quaker City Rubber Co., Philadelphia; hose. H. W. Johns-Manville Co., Washington; asbestos-felted insulation.

Studebaker Corp. of America, Detroit; automobile spare parts.

July 11, 1918.

Republic Rubber Co., Washington; tire casings.

The Seiss Mfg. Co., Toledo; horns.

July 12, 1918.

The Winton Co., Cleveland; parts of power plants for searchlights.

Dodge Brothers, Detroit; parts for Dodge Brothers cars.

Studebaker Corp. of America, Detroit; rims for Studebaker cars.

Garford Motor Truck Co., Lima, Ohio; hub-dometers.

WASHINGTON, July 22.—The following contracts were placed by the General Engineer Depot of the Army:

July 13, 1918.

United States Graphite Co., Saginaw; graphite compound.

Fir Production Board, Washington; select common fir.

Champion Spark Plug Co., Toledo; spark plugs.

General Electric Co., Washington; exhaust fans.

American Oil, Pump & Tank Co., Cincinnati; portable steel tanks.

Acme Rubber Mfg. Co., Trenton, N. J.; hose.

Goodyear Tire & Rubber Co., Washington; rubber gaskets.

Ford Motor Co., Detroit; parts for searchlight carriages.

Roberts Brass Co., Milwaukee; gate valves.

Republic Rubber Co., Youngstown, Ohio; hose.

## Hide Prices Fixed

WASHINGTON, July 22.—Prices have

been fixed by the War Industries Board for hides as follows:

## Packer Hides

Heavy native steers No. 1, 30 cents.

Heavy butt branded steers No. 1, 28 cents.

Heavy Texas steers No. 1, 28 cents.

Heavy Colorado steers, 27 cents.

Light native cows No. 1, 24 cents.

Country Hides (for Best Sections)

Extremes, 25 to 45 pounds, 22 cents.

Buffs, 45 to 60 pounds, 21 cents.

## River Plate Frigorifico Hides

Maximum price on steers, \$53.00 Argentine gold.

Maximum price on cows, \$40.00 Argentine gold.

The prices are f.o.b., shipped, including export duty and lighterage, but not including salting charges. The prices are the basis for all other differentials which will be published in due course. They are expected to equalize more nearly the actual market conditions as reflected in prices of country hides.

## Women's Division of Labor Department

WASHINGTON, July 22.—A Women's Division in the Department of Labor has been established. Miss Mary Van Kleeck who has been the supervisor of the Women's Division of the Industrial Service Section of the Ordnance Department has been appointed chief. She will serve as a member of the War Labor Policies Board, will co-ordinate the work for other women in the divisions of the Department of Labor, will co-operate with state Departments of Labor and will endeavor to bring about united action by the various states in national problems of women's work. The Women's Division will concern itself primarily with war conditions, but will be mindful of the need for observing and interpreting the tendencies in women's employment which are likely to have permanent social effects.

## Marlin-Rockwell Takes Braeburn Plant

BRAEBURN, PA., July 23.—The Marlin-Rockwell Corp. has acquired the plant of the Braeburn Steel Co. here. The property will be developed and equipment added as a means of insuring continuity of supply of alloy steel.

## Navy Contracts Awarded

WASHINGTON, July 20.—The Bureau of Supplies and Accounts of the Navy has placed contracts as follows:

July 8, 1918.

Winhter Motor Truck Co., Winthrop Harbor, Ill.; truck.

July 18, 1918.

Packard Motor Car Co., Detroit; motor trucks.

Empire Rubber & Tire Co., Trenton, N. J.; tires and tubes.

Ford Motor Co., Detroit; ambulance.

The Burgess Co., Marblehead, Mass.; boxing airplanes.

## Medical Corps Contract Awards

WASHINGTON, July 15.—The Surgeon General of the Army has issued the following contracts and purchases:

June 29, 1918.

General Motor Truck Co., Pontiac; spare parts for chassis.

H. H. Babcock Co., Watertown, N. Y.; ambulance spare parts.

July 6, 1918.

Pemberty Injector Co., Detroit; automatic injectors.

Detroit Graphite Co., Detroit; paint.

Gray Motor Co., Detroit; gasoline engines.

## Indianapolis Elects Automotive Committee

INDIANAPOLIS, July 22.—Members of the automotive committee of the Indianapolis division of the War Industries Board were elected Saturday. Walter C. Marmon, of Nordyke & Marmon, Indianapolis, was elected chairman. Others who will serve on the committee are: Alvin H. Smith, Ford Motor Co., vice-chairman; J. A. Bennell, Haynes Automobile Co., Kokomo; Robert H. Hassler, Robert Hassler, Inc., Indianapolis; George M. Dickson, National Motor Car & Vehicle Corp., Indianapolis; C. E. Lee, Buckeye Mfg. Co., Anderson; R. P. Henderson, Barry Mfg. Co., Indianapolis; E. H. Holmes, Stewart Wire Wheel Corp., and R. O. Bright, Arvac Mfg. Co., Anderson.

## Union Switch Adds Equipment

SWISSVALE, PA., July 23.—The Union Switch & Signal Co. has installed several additional steam drop and shaping hammers. Plans for the extension of the die room and increased facilities for heat treating are being prepared.

## Calendar

## RACING

July 27 — Chicago. Chicago Speedway.  
Aug. 3 — Uniontown. Uniontown Speedway Assn.  
Aug. 10 — Providence, R. I.  
Aug. 17 — Sheephead Bay.  
Sept. 2 — Uniontown. Uniontown Speedway Assn.

**Dependable Spark Plugs**

### Big Increase In Porcelain Efficiency

*2½ Times the Resistance  
to Breakage from Shock*

**H**OW to make porcelain for spark plug insulation, offer greater resistance to shock and vibration!

Ten years of original research work and the three-thousand-four-hundred-and-fiftieth experiment revealed the secret.

Champion 3450 Porcelain offers two and a half times the resistance to shock and vibration compared with the best previous Champion porcelain.

What an increase in that dependability which has given Champions their enormous prestige.

Always it has been to the dealer's advantage to sell Champions—now more than ever.

**Champion Spark Plug Co., Toledo, Ohio**

*Patched and ready to use in 3 Minutes*

# JOHNSON'S Hastee Patch

*Saves Time, Tires and Temper*

WITH Johnson's Hastee Patch the most inexperienced motorist can satisfactorily and inexpensively repair his own tubes. No time, labor or heat required. The Patch can be applied in three minutes—at a cost of 2c—and it's so simple a child can use it.

## *Ready For Instant Use*

With Johnson's Hastee Patch it takes but two or three minutes to make the repair and the tube can be pumped up immediately and is ready for instant use at any speed.

## *Better Than Vulcanizing*

Johnson's Hastee Patch is much better than vulcanizing because there is no danger of burning and spoiling the tube. Johnson's Hastee Patch gives equally good results on a pin hole puncture or a large blow out. It is conveniently put up in strips so the user can cut just the right size patch for each repair.

## *Cut Down Your Tire Investment*

If you'll carry a box of Johnson's Hastee Patch in your tool kit you can get away from the expense of a lot of spare tubes and casings which fast deteriorate during the hot motoring months. A box of Johnson's Hastee Patch in your car answers the same purpose as two or three extra tubes and casings, and there is a saving of 23c over garage vulcanizing on your smallest patch and much more on large ones.

**If your dealer is unable to supply you use attached coupon.**

**S. C. JOHNSON & SON, Dept. A - RACINE, WIS.**

## *Fine for Patching*

*Garden Hose  
Rubber Boots,  
Coats and Gloves  
Rubbers  
Auto Tops  
Foot Balls  
Hot Water Bottles  
And All  
Rubber Articles*

**S. C. JOHNSON & SON, Dept. A. Racine, Wis.**

I enclose 50c for which please send me by prepaid Parcel Post a strip of Johnson's Hastee Patch from which 25 average size patches may be cut. Satisfaction guaranteed or my money back.

## Fifty Tractors in National Demonstration at Salina

Plowing 100 Acres an Hour on the Plains of Kansas—  
Many New Machines Exhibited—Lack of Standardization  
Noticed—Need for Real Tests Manifested

By David Beecroft

**SALINA, KAN., July 30** (*Special to AUTOMOTIVE INDUSTRIES*).—Promptly at 1.30 this afternoon fifty tractors of nearly as many different makes started plowing a 240-acre field of Kansas winter wheat land; soon after 4 o'clock all of this was plowed, and incidentally the greatest tractor demonstration ever held had been formally opened.

The fifty tractors were lined up on a stretch one mile in width, and they plowed furrows in some cases one-half mile in length. The entire fifty started almost to a second at a flag signal, and over 25,000 spectators from Kansas and adjoining states followed the machines from one side of the field most of the way to the other.

In these days when wheat is so vital in our war program no sight on this side of the Atlantic could have been more inspiring, and the regret was that Herbert Hoover was not on hand to witness the soul-stirring sight. This plowing demonstration will be repeated three more afternoons.

### Results of Tests Not Made Public

These afternoon plowing demonstrations are only a portion of the program of the National Tractor Demonstrations. Since the middle of last week different makes of tractors have been given belt tests to demonstrate their horsepower over a 2-hour period. In addition to these belt tests there have been fuel economy tests in which the machines under official observation have plowed at their rated speed and with their plow equipment for a 2-hour period. There have been dynamometer drawbar tests in which the drawbar pull for average work has

been officially taken and also the maximum drawbar from machines. All of these tests have been conducted by a committee of agricultural engineers selected from different state agricultural schools under the direction of J. D. Davidson of California.

Unfortunately the results of these different tests have not been made public and will not be made public until after the demonstrations are over. The reason for this is that for months many of the tractor makers have strenuously objected to any form of test that would show fuel consumption per acre plowed, drawbar horsepower and belt performance of the engine.

Those who were insistent on such tests compromised by agreeing that such tests should be held, but that it would be optional with any firm to take them. A second compromise was agreed upon by which the different tractor makers agreed not to advertise during the demonstration any of the results of these tests.

It is for this reason that the present demonstration is robbed of a great factor of interest, as many of these tractor makers who have taken these voluntary tests do not yet know the official figures of their machines.

### Should Show Tangible Results

It is probable that before another year comes round sentiment favoring real tests will have worked out a feasible program so that the value of these demonstrations as attendance drawers will be continued. To-day E. E. McCullough, general manager of the National Implement and Vehicle Association, suggested that next year a committee of mechanical engineers from various

## Tractor and Implement Exhibits at the National Tractor Demonstration at Salina, Kansas

During the Week, 112 Tractors Were Demonstrated, Pulling Practically Every Type of Farm Implement

*A group of farm implements, giving some idea of the variety of the exposition*

*The tent of the Port Huron tractor, with several Clevelands in front*

*Where the Hart-Parr line was displayed*

*The exhibition of Oliver plows was complete*

Two more of the tractor exhibitors' tents, the one at the right showing the Port Huron exhibit

Both Avery and Case had extensive lines on exhibition in their tents

agricultural colleges be given official charge of such a series of tests with power to make and give to the public an official report of the tests. It is possible that participation in such will be voluntary, as was the case this year, but there will be the advantage of giving out the results before the demonstrations are over.

It is a question of grave concern as to whether manufacturers would be willing to participate in these demonstrations year after year unless some tangible results such as would emanate from tests could be made public. So far as these afternoon plowing demonstrations are concerned, they are not of much value to makers but appeal to the farmers attending. As such they are of local value only and not of national significance. Real tests would add a national aspect to the demonstrations and give an aspect that would go far toward assuring continued value.

The afternoon plowing demonstrations are much like a selling demonstration of an automobile on a good road. Every tractor is expected to be able to plow on a level field, and when the period of work is confined to 2 or 3 hours there is no opportunity for the spectator to get much of a line on the endurance of the machine.

Fortunately, the present demonstrations have brought out other forms of trials that do give a true criterion of the value of the machine. Starting from days before the present demonstrations opened, the Parrett company started one of its tractors pulling three plows on a continuous 100-hour test plowing night and day. The test was also a non-engine stop affair. Never before has such an official test been undertaken in connection with a public demonstration. The Parrett carried out its schedule and finished the job at 4 o'clock this afternoon.

The official figures are not yet available, but the tractor approximated 1 acre plowed every hour from the start with a consumption of 2 gal. of kerosene per acre. During the test the engine stopped but twice in 103 hours and 20 minutes that it was running. There was one stop of 3 min. 40 sec. caused by dirt in the sediment cup in the kerosene line, and there was a second stop for this same cause which required 2 min. additional.

The tractor was compelled to stop plowing for 13½ hours due to rain, but during all of this time the engine was kept idling at a speed of 360 r.p.m. Very few mechanical troubles

occurred. It was necessary to change one spark plug, which was done with the engine still running. One priming cup was also changed. This official test, in which every ounce of kerosene used was weighed by official observers and in which accurate record of every detail of the test was kept, marks a new era in official tractor performances, and it will do much to stimulate such tests, which are highly desirable.

#### Fordson Is Officially Tested

To-day the big interest of the demonstration was in the debut of the Fordson at an official test and the further fact that Henry Ford was on hand to see his machines. The fact that there are in Salina to-night 284 Fordsons to be delivered this week to farmers in Kansas added a chapter of realism that points more than any other one thing to the future magnitude of the tractor industry. These machines represent 2 days' output of the factory. The machines have already been sold to Kansas farmers through Ford dealers here.

The present demonstrations offer one of the best periods of the year for observing the progress that has been made in tractor designs during the past 12 months. The general entry of automotive makers into this field during the past year has not brought out as much new design and as many new types as was expected a year ago.

From the automobile end Ford has made good in a run-away fashion, some of the leading tractor makers frankly admitting that he has got the jump on them, and also admitting that they did not think it was possible to get into production as Ford has in such a short time.

General tractor development along engineering lines has not made so much progress as was expected. This is largely due to the demand for machines brought about because of the war, and when demand is so great it is not surprising that changes in design and general improvements are not up to expected standards.

There are several new machines, but the most permanent progress has been made by companies that are bulwarks in the field and are counted among the pioneers. Thus, Case has brought out its line of three new machines all built around similar fundamentals, so that this concern has its program for the future incorporated in these. Their case is parallel to that of a motor truck maker who has completed his line with a list of different capacity trucks that cover the

entire field he expects to cater to. Case now has a 10-18 for two plows; a 15-27 for three plows, and possibly four; and a 20-36 for four plow or light work with five plows.

Moline has developed its two-wheel Universal which is now a four-cylinder design with a complete electrical system embracing ignition, starting and lighting, this being the first machine to be so equipped. It goes a step further with electric governor for fuel feed.

An entry from the automobile field is the R & P tractor built by the Republic truck organization. This tractor was shown at the Kansas City tractor show but is not in production yet and consequently cannot be considered as having taken a fixed place in the industry.

#### Many New Models on Hand

Among the pioneer makers are others that have added new models. Avery has a new design which follows previous Avery fundamentals but has a four-cylinder horizontal opposed engine. This marks the first use of this type of engine or even a four-cylinder engine with this concern.

International Harvester, which has always clung to single- and two-cylinder engines for tractor use, has also brought out a four-cylinder design. It too is a horizontal job, but has the cylinders parallel like the fingers on the hand, with the crankshaft at one end. It is a valve-in-the-head design. It was expected that this company would show its new vertical four-cylinder design, but in this the spectators were not to be satisfied.

Several other new tractor models have been brought out. Thus Aultman & Taylor, which has previously built only very large traction engine types, has a new model with a four-cylinder vertical engine, marking the first time this pioneer concern has adopted such an automobile type of power plant. It uses a 4% by 6% Waukesha engine and is rated at 15-30 hp. It clings to the high-wheel design, using 60-in. drivers.

Another new machine is the Frick, a four-cylinder job fashioned after Parrett lines with the vertical engine mounted transversely. There is a Port Huron, a four-cylinder vertical engine job with a combination friction and gear transmission. The Uncle Sam, a newcomer, also uses a vertical type of four-cylinder engine. The same can be said of the Yankee and the Hession, both new machines.

The vertical type of automobile engine has practically usurped the new model field and in doing so has displaced the horizontal twin-cylinder engine in which the cylinders are parallel, with the crankshaft at one end.

The crop of new tractor designs indicates a great lack in variety of what might be designated standard parts for assembled tractors. There is a good variety of vertical engines to select from and the value of this is shown in the general use of this kind of engine in the new models.

#### Need More Standard Parts

On the other hand, no such opportunity for selection can be found in gearsets, and so the gearset situation remains chaotic. One concern has perfected a design which is meeting with general approval. This is Nuttall, but there should be two, three or more supplying such. The demand for good tractor gearsets would warrant much greater activity.

In the steering gear field chaos is literally rampant and there are many—nearly a dozen—steering gear designs that might be described as examples of American ingenuity, but they cannot be described as examples of good engineering. If there were two or three good standardized steering gear jobs the situation would clarify very quickly.

Some standardized design of front axle is needed. There are several very weak designs; in short, there is not any standardized design such as we have in the truck field or in the automobile field. As a result, ingenuity again runs rampant and engineering is thrust into the background. There are too many built-up axles that are not nicely balanced with the job they have to take care of.

There is nothing standardized as yet in the way of the pressed steel frame design. One or two pressed steel frames have come out, the R & P suggesting how easy it would be to arrive at some definite standard of shape.

As a result of no such existing standard there are two or three new tractors in which the channel side members of

the frame are spliced in the center where the stress is greatest. This has been done in order to have the front end high enough to support the engine and the rear end low enough to pass under the axle. Some frames are entirely too heavy for the job, and there are others which are too weak and although reinforced they weave as the tractor approaches under its load.

#### Reduce Weight; Increase Accessibility

This review of lack of standard units for those who would like to bring out a new machine could be continued much further, and the thought in enumerating these various parts is to indicate how tractor engineering standard is being held back.

A practical example of this came up to-day when one machinery concern engaged an engineer to develop a tractor that would be entirely different from others, this being the company's conception of an engineering task. As a result, the job has been described by several as a literal freak in which valve cages are used and many other disproved designs featured. Some tractor companies will have to change their engineering programs, otherwise others cannot very heartily approve of what should be war engineering work.

One engineer admitted to-day that he had told his company, which makes a large traction engine type, that he could cut 9000 lb. out of the tractor and have a more efficient and powerful machine. In these days of metal conservation and fuel conservation we should pause and think how really useful this metal could be made in other ways and how much of the fuel used to carry this 9000 lb. of useless weight could be better used in our war work.

Among engineers there is a good deal of criticism to the effect that several of our new tractor models are not nearly as accessible as they should be, reference being specially made to the need of adjusting or replacing lower crankshaft bearings. No definite policy regarding accessibility can be laid down. At best a path of compromise must be selected.

One engineer declares that the mechanical reliability of the part must be the prime consideration, and it is better to sacrifice accessibility if reliability is achieved thereby. One of our leading electricians when confronted with a similar situation invariably commented that he would willingly sacrifice 10 per cent of electrical efficiency if he gained thereby in mechanical efficiency.

#### Trend Toward Four-Cylinder Engine

It is true that many tractors have the lower pan of the crankcase well fenced in with front axle struts, steering linkages and cross frame braces and in some instances it looks like a rebuilding job to take up a lower connecting rod bearing. Engineers are generally free to criticize, but in seeing the mote in the other engineers' eyes fail to see the beam in their own.

It is almost too early in the industry to place too much importance on the mathematics of tractor specifications. There are a few unmistakable tendencies, one of which is toward the use of the vertical type of four-cylinder engine. The enclosed gearset is equally certain, and while any standardization of design is yet some distance off, the use of forged gears with cut teeth and anti-friction bearings as well as spliced shafts is certain.

Whether the three-plow tractor or the two-plow is to be the leader is very uncertain. Each tractor maker tries to answer this question in accordance with present manufacturing plans. The three-plow man declares that the two-plow job is too small for threshing machines, but the two-plow maker points to the new designs of threshing machines that are being brought out to meet the needs of his machine. The two-plow machine occupies the base of the pyramid, which means great volume of sales, and where there is great volume there are pretty certain to be special designs to go with that volume.

The redesigning of farm machinery for the tractor standard is one of the most encouraging conditions of the present year. The farm machinery field is being literally revolutionized. Plows are being designed, and already have been designed, which admit of speeds which the implement makers

(Continued on page 213)

# War Industries Board May Control All Raw Materials and Finished Products

New Priorities Regulations Include Everything Except Food, Fuel and Feeds—  
Certain Consumers Given Automatic Ratings Under Preference  
List—Board to Confer with Consumers on  
Their Steel Requirements

**W**ASHINGTON, July 30.—A new turn has been given priorities matters through the issuance of Circular 4 by the Priorities Division of the War Industries Board, and under which the complete control of all raw materials and finished products as well as steel and iron, and excepting only fuel, food and feeds, appears likely.

The War Industries Board has let it be known in a statement that steel will continue to be the chief commodity to be governed by the new priority regulations, but the regulations themselves are so framed as to include all raw materials and finished products.

The new regulations are for the duration of the war, and under their terms all consumers are placed under two broad heads as follows:

1. Consumers who get materials:
  - (a) Through Priorities Certificates.
  - (b) Through operating under a General Purpose List.
  - (c) Through being on a Preference List.
2. All other consumers, who are not entitled to Priorities Certificates, do not operate under the General Purpose List and are not on the Preference List will get materials and products only after all requirements in Class 1, above, are filled.

The regulations include classes of consumers similar to those laid down for the steel program; in addition there is what is termed a General Purpose List, this including the following seven divisions under which steel priorities were laid out early in June: (1) *Ships*; (2) *Aircraft*; (3) *Munitions*; (4) *Fuel*; (5) *Food*; (6) *Clothing*; (7) *Railroads*.

Further, there is what is termed a Preference List, under the various headings of which certain consumers are automatically classified and thereby given priority in the receipt of materials and products.

The various classes of consumers include AA, A, B, C and D, with subdivisions in each class indicated by a suffix number, such, for example, as Class AA1.

Class AA comprises all the emergency war work of an exceptional and urgent nature.

Class A comprises all other war work, including aircraft, military tractors and tanks and materials required in their production.

Class B comprises orders for work which, while not primarily designed for the prosecution of the war, are of public interest and essential to the national welfare or otherwise of exceptional importance.

Class C includes all orders and work not covered by priorities certificates or not given an automatic rating in the above classes but which are to be utilized in furtherance of one or more of the purposes embraced in the General Purpose List or the Preference List adopted by the War Industries Board and the Fuel Administration.

Class D comprises all orders and work not embraced in any of the other classifications.

The Preference List is an entirely new part of the regulations, and under it certain consumers are given automatic classification. The complete Preference List follows:

## PREFERENCE LIST

**Aircraft**—Plants engaged exclusively in manufacturing aircraft or supplies and equipment therefor.  
**Ammunition**—Plants engaged in the manufacture of ammunition for the United States Government and the Allies.  
**Army and navy cantonments and camps.**

**Arms (small)**—Plants engaged in manufacturing small arms for the United States Government and the Allies.  
**Chemicals**—Plants engaged exclusively in manufacturing chemicals.  
**Coke plants.**  
**Domestic Consumers.**  
**Electric Equipment**—Plants manufacturing same.  
**Electrodes**—Plants producing electrodes.  
**Explosives**—Plants manufacturing explosives.  
**Farm Implements**—Manufacturers exclusively of agricultural implements and farm operating equipment.  
**Feed**—Plants producing feed.  
**Ferro-Alloys**—Plants producing.  
**Fertilizers**—Manufacturers of fertilizers.  
**Fire Brick**—Plants producing exclusively.  
**Food**—Plants manufacturing, milling, preparing, refining, preserving, and wholesaling food for human consumption.  
**Food Containers**—Manufacturers of tin and glass containers and manufacturers exclusively of other food containers.  
**Gas**—Gas-producing plants.  
**Gas**—Plants manufacturing exclusively gas-producing machinery.  
**Guns (large)**—Plants manufacturing same.  
**Hemp, Jute and Cotton Bags**—Plants manufacturing hemp, jute, and cotton bags.  
**Insecticides**—Manufacturers exclusively of insecticides and fungicides.  
**Iron and Steel**—Blast furnaces and foundries.  
**Laundries.**  
**Machine Tools**—Plants manufacturing machine tools.  
**Mines.**  
**Mines**—Plants engaged exclusively in manufacturing mining tools and equipment.  
**Newspapers and Periodicals**—Plants printing and publishing exclusively newspapers and periodicals.  
**Oil**—Refineries of both mineral and vegetable oils.  
**Oil Production**—Plants manufacturing exclusively oil-well equipment.  
**Public institutions and buildings.**  
**Public utilities.**  
**Railways.**  
**Railways**—Plants manufacturing locomotives, freight cars, and rails and other plants engaged exclusively in manufacture of railway supplies.  
**Refrigeration**—Refrigeration for food and exclusively ice-producing plants.  
**Seeds**—Producers or wholesalers of seeds (except flower seeds.)  
**Ships (bunker coal)**—Not including pleasure craft.  
**Ships**—Plants engaged exclusively in building ships (not including pleasure craft) or in manufacturing exclusively supplies and equipment therefor.  
**Soap**—Manufacturers of soap.  
**Steel**—Steel plants and rolling mills.  
**Tanners**—Tanning plants, save for patent leather.  
**Tanning Extracts**—Plants manufacturing tanning extracts.  
**Tin Plate**—Manufacturers of tin plate.  
**Twine (binder) and Rope**—Plants producing exclusively binder twine and rope.  
**Wire Rope and Rope Wire**—Manufacturers of same.

The following is a list of materials, equipments and supplies which automatically take the classification prescribed:

Manufacture of turbines (all classes).....A-4  
 Repair or construction steam railway locomotives for use on  
 railroads under jurisdiction of U. S. Railroad Administration...A-4  
 Production of electrodes.....A-5  
 Manufacture of wire rope.....A-5  
 Building of ships or other water craft for and under direct  
 contract with U. S. Shipping Board Emergency Fleet Corp....A-5  
 For building all cargo water craft (not pleasure craft) except

those under construction by or for the U. S. Shipping Board Emergency Fleet Corp.....	A-6
Manufacture of machine tools (metal and wood) machinists' tools, small tools, hand tools, mining tools, machinery and equipment .....	A-6
Manufacture of steam railway materials, equipment and supplies (other than locomotives) for use on railroads under jurisdiction of U. S. Railroad Administration.....	B-1
Manufacture of locomotive cranes and travelling cranes.....	B-1
Manufacture of electrical equipment other than turbines (not including electrical supplies as distinguished from equipment).....	B-2
Manufacture of farm implements.....	B-2
Manufacture of textile machinery.....	B-2
Manufacture of tools, implements, machinery and equipment required for production, harvesting, distribution, milling, canning and refining of foods and feeds.....	B-2
Manufacture of binder twine and rope.....	B-2
Manufacture of oil well supplies or equipment, by which is meant supplies for the production of petroleum and natural gas but not including pipe lines, storage tanks of 1,000 bbls. capacity or over, tank cars or refineries.....	B-2

Orders that come under these various automatic classifications must be endorsed by an affidavit to the effect that they have been automatically rated in their particular class and that consumer has filed a pledge with the War Industries Board to the effect that the materials, equipment and supplies will be used in accordance with the classification.

Applications for higher ratings should be made only when it is in the public interest and where automatic ratings will not secure delivery of the order on or near the date required.

Class AA orders and work take precedence over all other classes with classes A, B, C and D following respectively, all irrespective of the dates the orders were placed. Orders with a lower suffix number in similar classes are given preference, as, for example, class A-1 precedes class A-2.

However, the classification of an order means simply that it should be given such precedence over orders of lower classification as may be necessary to insure delivery on the date specified in the order. It does not mean that work shall cease on orders of a lower classification or that the order should be completed and delivery made in advance of lower classification orders if this is not necessary to effect delivery within the time specified.

The one to whom the priority certificate is directed or who has received an order taking automatic classification is expected to make his own production plans to secure maximum efficiency out of his operations.

Special forms of priority certificate applications will be furnished by the Priorities Committee.

As a general rule, when an application is necessary it should be made by the consumer. Orders demanding priority certificates for Government contracts will receive certificates by application made directly to the committee. Government sub-contractors, one or more times removed from a direct contractor but furnishing materials to be used in fulfillment of a direct contract, can secure priority assistance by applying directly to the committee.

Purchasers of materials, commodities or supplies which fall into class B can secure priorities assistance from the committee.

Application for priority should be made against the actual producer or manufacturer and will not be issued except in unusual occasions against jobbers or brokers.

Judging by the several schedules and the Preference List, it is safe to assume that all articles directly required for the war, including such as airplanes, military passenger cars, military motor trucks, military tractors, military motorcycles and tanks, will fall within the priority certificates classifications.

Farm tractors are automatically placed in class B-2, coming under the head of farm implements, and also entitled to priority certificates.

Since Circular No. 4, which contains the above regulations, was compiled several weeks ago, although just issued, it is fair to assume that commercial motor trucks will probably be given a class B automatic rating. This assumption is based on the favorable hearing held last week between the Priorities Committee and the motor truck industry representatives, at which time it was stated that a reasonable supply of steel would be assured the truck makers.

Passenger cars for general use will in the main fall into

class D, but under special occasions may be given a higher rating. Individual consideration will be given various passenger car makers in their requests for the raw materials they need, and such matters as conversion possibilities, unfilled partly completed orders, etc., will be weighed.

The new regulations call attention to the method of securing a place on the Preference List. Applications must be made on special forms which can be secured from H. G. Philips, secretary of Priorities Board.

The Priorities Committee will not handle fuel priorities, which will remain entirely under control of the Fuel Administration. Application for transportation assistance should be made to T. C. Powell, manager of Inland Traffic, War Industries Board, Washington, D. C.

In its statement the War Industries Board makes plain that curtailment of the use of steel will continue to be effected as in the past by means of a reduction of needless lines, varieties and sizes of products, elimination of wasteful styles, models and methods and by the substitution of products or materials.

"As it is obviously impossible," states the board, "to supply all industries utilizing steel and iron with their normal supply, the board will, with its Priorities Division and other sections, operate a system of industrial hearings, in which committees representing entire industries may appear and present:

- A—Their normal requirements for iron and steel.
- B—Their reasonable requirements under war conditions.
- C—The stocks now on hand in each plant.
- D—The fuel consumed and all other pertinent facts.

The board emphasizes that there will be comparatively little iron and steel left to distribute to those industries engaged in non-war work and for consumers for application to non-war purposes. It states, however, that:

"A portion, at least, of the product of nearly every industry may be classed as a direct or indirect war requirement or essential to the civilian population, but in many the percentage of non-essentiality predominates. On the other hand, nearly every industry, including so-called war industries, has a percentage of non-essentiality in its production.

"It is the policy of the War Industries Board, through the hearings mentioned above, to take counsel with each industry, determine the extent to which it can and should, as a war measure, curtail its production, and particularly curtail its consumption of iron and steel, limiting its output to essential uses as far as practicable but without destroying or unnecessarily injuring an industry or legitimate business."

### Proposed Change in Pipe Thread

IN 1913 it was suggested to the American Society for Testing Materials that a committee on tubes investigate the question of a change in pipe thread standards. A sub-committee was appointed to collect data on pipe failures and to make tests showing the comparative strength of the Briggs (present American standard pipe threads) and Whitworth threads.

In January, 1915, the Executive Committee appointed a new technical committee on the Revision of Pipe Threads, and the following societies were asked to co-operate with this committee: American Gas Institute, American Society of Mechanical Engineers, Manufacturers' Association on Standardization of Fittings, Master Car Builders' Association, Railway Signal Association. Various forms of threads were proposed and a number of experiments were made by the committee to determine the strength of the threads, the tightness of the joint and the practicability of cutting the various forms of threads and of the interchangeability of the suggested types with the existing standard. These experiments were completed and the results were reported to the Society for Testing Materials.

This work, of course, is all preliminary, and the most difficult part of the work is still to be done. The tremendous manufacturing difficulties involved in any change in standard of pipe threads are fully realized. The type of pipe thread which may be employed is a matter of design and it has therefore been decided to transfer the work to the American Society of Mechanical Engineers.

# The De Haviland IV Biplane

Description of British Long-Distance Reconnaissance and Bomb-Dropping Machine, Which Also Is to Be Built in the United States, Fitted with the Liberty Engine—The Model Described Carries a Rolls-Royce Engine

FOR the following description of the De Haviland biplane, one of the leading types of long-distance reconnaissance and bombing machines used by the Allied armies, we are indebted to our London contemporary *Flight*, which had it translated from the German aircraft periodical *Flugsport*. We have changed all dimensions both in the text and illustrations from millimeters to inches, having redrawn the illustrations.

This large airplane is chiefly built by the Aircraft Mfg. Co., Ltd. The different machines show minor differences in construction and outfitting according to the time of construction. Both wings of the two strutter biplane, which have distinctly rounded tips, have a span of 508½ in. (42½ ft.) and a chord of 66 in. The stagger is 12.5 in. There is no sweep-back, but the upper and lower planes are attached, respectively, to a center section 27.5 in. wide and direct to the body, at a dihedral angle of 174 deg. The pilot, whose seat is right under the top plane, center section, has a good view forward. The center section in the wings have their trailing portions cut away in the center to give a better view backward. The angle of incidence is 3 deg. at the body and at the top plane center section. Both main spars, which are of spruce, are of one section, left solid where the compression ribs are. At these points and where fittings are located the spars are not only left solid but are re-

inforced by mahogany pieces glued and screwed on. At a point between the inner inter-plane struts and the commencement of the wing flaps the main wing spars are spliced and bound with fabric.

The wing ribs are only very slightly cambered on the under surface. Leading and trailing edges are slightly raised. Into grooves in the two flanges, which measure ½ in. in width and 0.175 in. in thickness, are glued and tacked with brass tacks the three-ply webs, which are provided with large lightening holes. The ribs at the struts and in the middle of each bay have flanges as wide as 1.45 in. and the web between them is solid spruce between the spars. Between every two ribs, which are spaced 12.2 to 15.7 in. apart, there is a false rib extending from the leading edge to the front spar. The internal wing bracing, which is of thick-ended wire, is in duplicate up to the middle of the outer bay. The wing covering is of a yellowish white color, and is sewn to the ribs in such a way that the stitches surround the whole rib. In front of the trailing edge, which is in the form of a strip of wood, eyelets are incorporated in the under surface, which serve to equalize pressure and to drain out moisture.

The crank levers of the wing flaps, which in all the planes are hinged direct to the rear spars, are made of 1/16-in. sheet aluminum which is reinforced on either

Assembly views and details of the body

side by facings of wood riveted on. The same construction is employed for the elevator and rudder cranks. At their outer end, where the control cables are attached, the aluminum cranks are doubled over. The very simply arranged wing bracing consists of stream line wire, while the external drift bracing takes the form of cables.

The wiring fittings are, as in so many other English machines, very simply carried out. Sheet steel plates 0.18 in. thick at the outer plane struts and 0.18 and 0.12 in. at the inner struts, having lugs bent to the angle of the bracing wires, are secured to the wing spars by two bolts. A large forked bolt passes through the center of the spar, while a second, smaller one, passes down the outside of the spar. The interplane struts, which are made of spruce, are of stream line section, and the inner struts are kept stronger than the outer ones. On the ends of the struts are short sheet steel shoes, into which are riveted aluminum packing pieces hollowed out in the center. Through these are passed 5/16-in. steel bolts, which rest in the forked end of the spar bolts, the bracing wires keeping the struts in place. The struts for the top plane center section are similarly attached.

### Method of Building Up Body

The fuselage is covered with ply wood up to a point behind the gunner's cockpit, this part being built up without the use of diagonal bracing. The longerons are of spruce and the engine bearers of ash. The formers, as well as supports for controls and machine guns, are made of ply wood, some of which is 13-ply and as much as 1 in. thick. The fittings for the attachment of the lift wires are each connected with two 5/16-in. through-bolts. The after portion of the fuselage is carried out in the usual manner as a girder, and the longerons are spliced. This does not apply to the extreme rear part underneath the tail plane, which is covered with ply-wood  $\frac{1}{8}$  in. thick. In the front the fuselage has a rounded top. From the observer's seat vertical formers gradually carry the top into the rectangular section at the beginning of the tail plane.

The undercarriage is very light in proportion to the heavy machine. It weighs 119 lb. Each pair of struts is of solid wood and is not bound with fabric. Screwed to the struts are vertical strut-shoes of wood, which carry, in addition to the wheel axle, horizontal tubes for the attachment of the rubber shock absorbers. The axle rests between two cross-struts of wood, which are shaped to a fair shape and connected at the bottom by  $\frac{1}{8}$  in. three-ply. In order to cause no eddies during flight the axle is fitted into the stream line casing thus formed by covering its upper side with a layer of wood suitably hollowed out and secured to it with a wrapping of fabric. In order to better guide the axle in the slots in the struts this casing of wood is left square at this point and entirely surrounds the axle. It is covered with sheet metal. The diagonal bracing of the undercarriage is in the form of stream line wire, and is only placed in the bay of the front chassis struts. In addition there is a horizontal tension wire running in front of the stream line cross-strut.

### Attachment of Tail-plane

The tail-plane, which is of rectangular plan form with rounded corners, is so attached to the body that its angle of incidence can be carried from the pilot's seat, during flight, from +2 deg. to +5 deg., as in the Sopwith. For this purpose its front spar is so mounted as to be free to rotate, while the rear spar with its bracing is secured to a vertical tube placed in front of the stern post. This tube carries a thread engaging with an internally

Interplane strut attachment

threaded bobbin, bolted to the stern post but free to rotate, operated by a hand wheel and cables, and forcing by its rotation the thread, and with it the vertical tube, up or down. The two elevator flaps, hinged to the tail plane, are not connected to one another. The rudder has a balanced portion as do many German machines.

The 12-cylinder Rolls-Royce motor develops, according to the firm's plate on it, 300 hp. at 1650 r.p.m., when the hourly consumption is 28 U. S. gal. of gasoline and 1.2 U. S. gal. of oil. The speed is not to exceed 1800 r.p.m. In general arrangement the engine is similar to older types of the same make, but it has four carbureters. The exhaust is either carried over the top plane or direct through short collectors slanting outward from the body. The nose of the fuselage is formed by a radiator fitted with shutters over its upper part. Through an opening in the center of the radiator projects the reduction gear of the engine, which reduces the speed of the airscrew to 900 r.p.m.

### Enough Fuel for 2¾ Hours' Flight

Under the front of the body is placed transversely the oil tank, which has a capacity of 5.5 gal. The main fuel tank, which is arranged for air pressure, has a capacity of 68 gal. and is placed behind the pilot's seat. A gravity tank holding 7.4 gal. is placed under the left top plane. Sufficient fuel is carried for a flight of about 2¾ hours' duration. In another there is an additional tank holding 20 gal., which brings the capacity up to about 3¾ hours.

More recent machines have, instead of the one pressure tank, and mounted in the same place, two tanks placed side by side, each of which is provided with a supply pump driven by a small propeller. With this arrangement a spring loaded valve is provided inside the tank which returns any surplus gasoline to the tank. The two leads from the main tanks and that of the gravity tank are joined at the engine to an omnibus tube, to which is attached a manometer for controlling the tanks.

Details of landing gear

*Elevations and plan of De Havilland biplane and sketch of its control connections*

The machine is provided with complete dual control. The control lever of the observer is removable. The wing flaps are interconnected. Their cables run on the outside of the wings along the leading edge. Each wing flap has two crank levers. The upper and lower flaps are connected by two stream line wires. In the same manner the elevator and rudder cables run on the outside of the fuselage. The rudder cables are in duplicate, while each of the elevator flaps has single control cables.

The equipment of the pilot's and observer's cockpits differs in individual machines. On an instrument board in the former, provided with illumination for night flying, are the following instruments: Speed indicator, revolution counter, altimeter, thermometer, clock, hand pressure pump, inclinometer, map board and compass. To the left of the pilot the various fuel pipes are so arranged that the different cocks are within easy reach. On the same side are arranged oil and fuel pressure indicators, a pressure pump fed from the gravity tank, and also on a common axis the throttle, spark advance lever, and mixture regulator for altitude work.

On the throttle rods a catch lever is arranged, so that when the throttle is closed the lever for regulating the mixture at altitudes will return with it. To the right of the pilot are arranged the cables controlling the radiator shutters, the switch for night illumination and a shelf for signal cartridges. Fuel level indicators are not fitted.

In the observer's cockpit are placed a speed indicator, an altimeter, a throttle and a switch for night illumination. Observer's and pilot's cockpits are placed far apart, on account of the main fuel tanks being placed between them. For communication between the occupants there is a speaking tube on the right, and on the left an endless cable passing over rollers in the two cockpits. Behind the observer's seat is the mounting for the camera with adjoining shelves for the slides. The presence of a wireless outfit could not be ascertained in any of the machines. The armament consists of two interconnected machine guns mounted on a turntable in the observer's cockpit and of a fixed machine gun for the pilot mounted on the left of the top covering of the body. The control of the fixed machine gun is accomplished hydraulically by a control mechanism placed immediately behind the airscrew. This mechanism is driven off a pinion on the hub of the airscrew, and releases two shots for each revolution of the airscrew. Firing of the gun is accomplished from the control lever. A spring-controlled hand pump for filling the leads is mounted on the floor of the pilot's cockpit. For loading there is either a lever on the gun or a cable running over a roller, provided with a grip. A telescopic sight is placed to the right under the gun, in front of the rectangular wind screen. As the observer's seat is placed rather far aft a good field of fire is also obtained from here in an outward and forward direction.

The bomb gear, judging from the makeshift way in which the release gear is built, appears to have been added as an afterthought. Bomb racks, either arranged for four smaller or for one large bomb, are placed under the lower wings and under the body. The release is accomplished from the pilot's seat by means of Bowden cable. The cables are either joined at the right of the seat or arranged separately on the outside of the body. A sighting arrangement is built into the body immediately behind the rudder bar. It consists of a square plano-concave glass plate, 13/16 in. thick at the edges and 0.2 in. thick in the center. Underneath this are three wire rods soldered at right angles to a fourth rod lying in the direction of flight. Further down about 6 1/4 in. is another longitudinal rod, and a transverse rod working

Control lever and universal support

in longitudinal slots, and which can be locked in place by screws.

The weight of the machine empty, but including cooling water, was ascertained to be 2440 lb. If the maximum useful load is assumed to be 1300 lb. we obtain a total weight of 3740 lb. As the area is 434 sq. ft., the loading is  $3740 \div 434 = 8.6$  lb. per sq. ft. The load per hp.,  $3740:300 = 12.45$  lb. per hp.

# Grease vs. Oil for Chassis Lubrication

Manufacturers Vary Widely in Opinion and Changes Are Frequent—Some Have Changed Back and Forth—Grease Under Pressure Desirable

**D**URING the winter of 1917 and the spring of 1918 a rising demand for oil chassis lubrication was noted. The idea of using oil lubrication from a central source of supply so that the individual bearing points would not require attention has always been attractive. The interest of every engineer in the industry was aroused by the system used on the Fergus car, in which the springs, shackles and other important bearing points throughout the chassis were lubricated from a central supply system. This system immediately reopened the controversy as to the comparative merits of oil and grease for lubrication, with the result that a considerable impetus was given to the adoption of oil for chassis lubrication. This demand for oil lubrication, particularly on the spring or shackle bolts and other points about the chassis customarily lubricated by grease cups, led to the use of oil cups in a great many instances. Now there has been a reaction, and a few of the manufacturers are considering whether it is not advantageous to use grease under conditions which eliminate the obvious disadvantages.

## Pressure Impossible with Oil

One of the fundamental difficulties with oil lubrication is that it is impossible to maintain pressure on the bearing surfaces; that is, the oil cannot be fed under pressure unless there is some sort of circulating system such as is used in the engine. If the oil were to be fed by pressure to bearings such as those of the shackle bolts the whole supply would soon be lost unless there was some means of trapping the oil working through the bearing and recirculating it. As this is impossible, or

at least impracticable, the feed had to be by gravity or by capillary attraction or some other means which, to say the least, is not positive.

It is doubtful whether a feed of this kind is capable of maintaining the desired film, particularly with the rather heavy body oil necessary to take care of the conditions at certain points.

Grease has been used in bearings of this kind in preference to oil because of its ability to withstand pressure. Thin oil is useless if it is subjected to a very high pressure owing to its tendency to be squeezed out, or at least concentrated into the depressions of the metal surface, leaving the high spots exposed to wear.

## Grease Better if Film Is Maintained

The chief advantage of oil as a lubricant is its fluidity. Because it flows so easily, oil can, of course, reach all parts of the bearing, but it is not this ability to flow which prevents friction. It is the greasiness, or what may be termed "oiliness" of the oil which prevents friction. With this in mind, it is obvious that where it is possible to feed or use grease for lubricating purposes and to positively maintain the film it is best to use grease.

Were it not for the fact that lubricating systems for trucks, passenger cars and tractors had to be so arranged that a temperature variation of possibly 100 deg. will be taken care of, the difficulties would not be so great. An oil of

Lubrication chart of average passenger car chassis, showing points where oil is used and where grease is used

Left, above—Patent type of grease cup in which grease is fed from a paper cartridge. Below—Section through ordinary type of grease cup. Right—Screw compression grease cup for feeding grease under pressure

the correct body for the particular job should be selected and used continuously. This cannot be done, however, in the case of a vehicle which operates outdoors. It is, therefore, necessary to combine the qualities of fluidity with those of greasiness or oiliness, as it may be called, in order to secure the correct kind of a lubricant to flow into the bearing and to lubricate it after it gets there.

It must be remembered that fluidity, the property which causes oil to move into or through a bearing, also causes it to run out of it. Therefore, a lubricant such as grease, which stays wherever it is put, or at least tends to stay where it is put, has a marked advantage if it is possible to put the grease at that particular point. For this reason the use of grease cups in which the lubricant is introduced under pressure is attracting attention from engineers at the present time. The Packard company has recently introduced a number of pressure grease cups over its chassis to take care of conditions of this nature.

A perfect bearing, perfectly lubricated, would last forever. Perfect lubrication means the spreading of an unbroken film of lubricant between the bearing surfaces. When this film is broken the bearings come into metallic contact, and when bearings come into metallic contact wear takes place. The reason for a lubricated bearing wearing out is that the plane of the bearing surface does not coincide with the plane of the moving surface. In other words, the planes are not parallel. This break in the condition of parallelism, due to depressions in the bearing line surface or to projections from that surface, establishes a condition where it is impossible to protect the two surfaces by an oil film, and the result is that wear takes place. In other words, wherever the oil film is unbroken there is no wear.

### Difference in Films

The film established by oil lubrication and that established by grease lubrication are different. A microscopic view of a bearing lubricated by oil shows that there are two coats or films, one on each bearing surface. The friction is not between metal and oil, but between these two films of oil. On the other hand, the microscopic view of a grease lubricated bearing shows that there are three such films. One on each bearing surface and one between the two. The result is that a grease lubricated bearing has a third, extra cushion, which is one of the factors in securing more perfect lubrication.

It has been frequently asserted that a grease-lubricated bearing in winter time simply cuts a path for itself through the grease and lubrication ceases. This is a condition which may exist; but when it does, it means that the choice of lubricant has been faulty and compensation for winter temperature should have been made in the choice of the lubricant. To advantageously use grease on a bearing which has a heavy load to sustain it is necessary that the grease be put in under pressure. The only way that the grease can be put in under pressure is by means of a pressure cup or gun, which seals the grease against leakage of the plunger used to force it in. Some ingenious methods have been devised to accomplish this result; it is not the purpose of this article to mention these, but rather to give an outline of conditions which must be met in handling the lubrication question.

*Lubrication chart of a truck using oil lubrication throughout with no grease cups*

At the present time there are two main kinds of grease. One is produced straight from a crude petroleum, the other is a manufactured product, being a combination of mineral oils and tallow soap. The first kind are natural greases, which are nothing more or less than crude petroleum products and have been found to be quite satisfactory for most purposes, but are not always capable of withstanding large ranges of temperature. That is, they are either too soft to start with or under conditions of low temperature they are apt to harden excessively.

The manufactured greases vary in consistency from a heavy oil to practically a solid. The soap merely acts as a flux to bind the material together. That is, the soap is used as a binder for the mineral oil products. These two schools of grease manufacture have various arguments, and the question is one which is too large to come within the scope of this item.

### Manufacturers in Doubt

That the entire subject is one which has opened up a wide difference of opinion is quite evident from the number of times which certain manufacturers have changed from grease to oil and back to grease again for chassis lubrication. It is admitted that grease, when applied by the usual paddle method, is a dirt catcher, and unless the person greasing the car is very careful he is apt to introduce a considerable amount of dirt into the bearing along with the grease. On the other hand, grease, when squeezed into place, is a natural protector of the metal and tends to hold its film against heavy pressure. Oil is not always suitable except for very fine or delicate bearings, and the heavy oil which must be used as a substitute for grease is subject to limitations of flow, as well as to differences in its consistency due to variations in temperature. Undoubtedly, if a central lubricating system could be worked out either for oil or grease, a big accomplishment would have been made.

### Regenerated Rubber

**O**BJECTS made of a new regenerated rubber product, called agatit, were shown by Professor M. Le Blanc at the April meeting of the Bunsen Gesellschaft. This product has been worked out in the institute for physical chemistry of the University of Leipzig, by Le Blanc and Lüttke, in conjunction with industrials. It is supplied either in a fine emulsion or colloidal solution, which is convenient for many applications, or as a solid. The latter is much used, it was stated, in packing for condensers and on U-boats. It also serves as a substitute for leather, and is in one respect superior to rubber for this purpose, because it can be nailed and sewn, which is important for sole leather. Rubber gloves for medical men and feeders are also made entirely or largely of agatit. It was mentioned that rubber gloves were hardly obtainable at all in Germany now, while these new gloves only cost 2.50 marks; it is doubtful, however, whether this figure meant the estimated cost of manufacture or the sale price.

# Electric Heating and Heat Treating\*

The Advantages of the Electric Furnace for Forge Shop Use—Uniformity of Heating—Minimum Production of Scale—A Reduction in the Percentage of Imperfect Forgings

By T. F. Bailly

IT is only at a comparatively recent date that the heating and heat-treating operations incident to the manufacture of forgings have been considered with the seriousness which they require. A careful investigation of defective work and trouble with materials generally, has prompted the manufacturer to give more attention, not only to heat-treating furnaces and their shortcomings, but heating furnaces as well.

It is a well known fact among steel forgers that if steel is heated to too high a temperature, a so-called "burning" takes place, which is essentially an overheating of the steel, so that the occluded gases expanding in the plastic metal make the steel very porous, and in such a condition that no amount of forging or subsequent heat treating will correct this defect.

In addition to this, a great deal of trouble has been experienced by overheating the steel on the outside, due to too rapid heating. This is a common fault with particularly fuel-fired furnaces, and it is not an uncommon thing to see billets taken out of the furnace, whose exteriors are dripping, and whose interiors are still hard and difficult to handle in the dies.

The ideal conditions, of course, in heating a billet for forging, is that the metal is uniformly heated throughout, and have a minimum scale or oxide on the exterior. This is difficult to do in a fuel-fired furnace, owing to the fact that all fuel-fired furnaces, in order to obtain rapid heating, must run with a sharply oxidizing flame, and the oxidation or scaling caused by this flame may amount to as much as five per cent of the metal, in extreme cases.

The electric furnace offers an ideal heating medium for steel, as it is not necessary to carry such high ruling temperatures for a given heat desired in the metal, and the furnaces themselves operate normally with a reducing atmosphere at all times. There is, consequently, a saving in metal due to the lack of oxidation, which, in extreme cases of say 5 per cent loss on steel worth \$80 per ton, would amount to \$4 per ton of metal heated.

In addition to this, the steel being in a much better condition when it goes to hammer or press, due to the absence of scale, there is less wear on the dies and less danger of the dies being filled up with scale from the forging itself, as it is sometimes difficult, even with air blast or steam jet to keep the dies entirely free.

\*Paper read before the American Drop Forge Association.

Fig. 1—A 900-kw. electric furnace for heat treating crankshaft forgings. Operating at full capacity it will heat 3 tons to 1650° Fahr., and draw at 1000° Fahr. after quenching in one hour

In addition the electric furnace is bound to reduce the number of defective forgings, some of which are always caused by improper heating, either from the wasting away of the steel if left too long in a fuel-fired furnace, or to a hard center, so that the steel does not flow well in the dies.

The question of the adoption of electric furnaces for the heating operations resolves itself then largely into a matter of cost, and this may be summarized as follows: Table 1 is a typical running sheet on an electric furnace of 600 kw. capacity heating 3¼-in. round billets for forging into 3-in. naval shells.

It is to be noted that the average current consumption per ton is a little less than 260 kw.-h.; but, taking as a basis, a figure of 300 kw.-h. per ton to cover delays and starting up this type of furnace, and with current at one cent per kilowatt-hour, the cost of heating for electricity would be \$3 per ton. The renewals and repairs should, in no case, exceed that of the fuel-fired furnace; and, due to the non-oxidizing atmosphere of the furnace, and the elimination of the sharp cutting flames, these repairs should average, in practice, much less.

Against this charge of \$3 per ton for electric furnace operation should be taken the fuel oil for a similar furnace, which, when operating on substantially 2 tons per hour, would approximate, in the average plant, at least 50 gal. per ton; and in direct-fired non-continuous furnaces this figure would be considerably increased. But even at a fuel consumption of 40 gal. per ton, and with oil at 5 cents per gallon, this charge would be at least \$2 per ton. Thus, if the metal loss on \$80 steel should be over 1½ per cent, or \$1 per ton of steel heated, the cost of electric furnace and fuel-fired furnace operation would be the same, with the exception of the better class of work done by the electric furnace, which would make a greater saving, due to the production of a higher percentage of good forgings put through the furnace and press.

On the 600-kw. furnace the difference in metal loss is some-

Fig. 2—A small electric furnace used in heating gear blanks, capacity 200 lbs. per hour to 1650° Fahr. using 40 kw. per hour

what over 5 per cent, and the reduction in the number of pierced billets rejected, due to eccentricity is such that in this item alone there would be at least 5 per cent more forgings by the electric furnace heating, due to the more perfect heating of the billets.

The heat-treating of forgings is a matter that has already been given a great deal more attention in the production of forged material than the heating just discussed, as the limitations in temperature and furnace conditions are more thoroughly known, and a variation of even 25 deg. in the heating, or more especially in the drawing temperature, makes a very noticeable and decided change in the physical characteristics of the piece.

There are perhaps no more exacting requirements in forging than those of gears for automobiles, and in this connection the furnace shown in Fig. 2 will be of interest. This furnace is the smallest type built and has a capacity for heating

Fig. 3—Relative variations in furnace temperature and kilowatts used in run of furnace recorded in table on page 190

200 lb. of steel to a temperature of 1650 deg per hour, with a current consumption of 40 kw. per hour. This furnace has a hearth 2 ft. wide by 3 ft. long and a guaranteed current consumption of not to exceed 400 kw. per ton of metal heated. This furnace is used exclusively in the heat treatment of gears for one of the best known motor cars in the country. There is practically no scale in the furnace, and the gears come out in very much better shape than in fuel-fired furnaces, as it is possible to maintain the temperature well within the range of 15 deg. Fahr. above or below a desired point.

A larger size furnace, of the continuous type is used extensively for the heat treatment of small parts for airplanes—parts so small that it is necessary to place the material in pans in order to facilitate handling through the furnace. This furnace has a hearth substantially 10 ft. long and 2 ft. wide and a capacity for heating 1000 lb. of steel per hour to a temperature of 1650 deg. Fahr. with an electrical consumption of 150 kw. per hour and a current consumption of 260 kw.-hr. per ton.

#### A Furnace with Automatic Control

A larger size furnace has automatic control equipment by means of which the human element is very largely eliminated. This equipment is entirely automatic in operation, the only human labor involved being the placing of the material to be heated on the charging platform of the first furnace. All subsequent operations, including the removal of the material from the first furnace, the quenching in the quenching medium, the charging in front of the second furnace, the pushing through that furnace and discharging thence, all are controlled by a special motor-operated valve pulpit, and dominated by the pyrometers in the discharge end of each furnace.

The first equipment of this type was installed four years ago for the heat treatment of cast-steel draw-bar knuckles,

and was duplicated the next year by the same concern. Both of these equipments have attracted wide attention among men who are interested in the heat treatment of steel and continuous runs of over 5000 consecutive hours have been made, in which over 14,000 tons of steel were heat treated.

#### For Heat Treating Crankshafts

What is substantially a duplicate of these furnaces, except that it is adapted to the heat treatment of crankshaft forgings is shown in Fig. 1. The electrical capacity of this equipment is 900 kw. When operating at full capacity, it will heat treat 3 tons of steel per hour, consisting of heating to 1650 deg. Fahr., quenching and drawing at 1000 deg. Fahr. All of the operations of the furnace are hydraulic, the material being pushed through in cast chairs, supporting the material. This is necessary in this particular furnace, owing to the fact that all the forgings lack uniformity of section; while, as in the case of the draw-bar knuckles treating equipment there were two parallel surfaces which enabled the material to be put through without supporters or containers. The current consumption when heating to approximately the temperature mentioned above, and when operating at full capacity, is not to exceed 300 kw.-hr. per ton of metal heat treated, and it is possible to maintain a maximum temperature variation, when operating continuously and at full capacity, of not to exceed 10 deg. Fahr.

With an equipment of the character described, and with sufficient quantity of material to keep it operating at a constant rate, it is possible to substantially duplicate in the plant the conditions obtained in the laboratory and bring the heat treating operation to one of very high precision so that no parts should be rejected owing to defective treatment.

*In the discussion of the above paper by members of the American Drop Forge Association the consensus of opinion expressed was that for heating steel for forging electric heat was too expensive.*

# Rest Rooms in a Large Ignition Plant

**T**HESE photographs show the interior of three of the rest rooms for women in a large plant devoted to the manufacture of ignition, starting and lighting apparatus. The welfare work of this plant is in charge of a committee composed of the forewomen of the different departments in which girls are employed. In each rest room there is a matron whose duties are to attend to the needs of the girls, to give out aprons, and to see that the privileges of the room are not abused. It is considered, in this plant, that a room approximately 30 x 65 ft. is necessary for 150 girls

# The Patent and Trade Mark Laws of the Argentine\*

Three Kinds of Patents Obtainable for Terms of from 5 to 15 Years—Novelty a First Essential—Priority of Trade Mark Registration in Most Cases the Only Requisite

By R. W. Huntington

A LARGE amount of misinformation regarding patent and trade-mark conditions in the Argentine Republic has been published or otherwise disseminated in the United States. The principal cause, however, of false impressions regarding patent and trade mark conditions in that country lies in the fact that many persons fairly well versed in similar matters in their own country jump to the conclusion that they must be the same everywhere. In patent matters in the Argentine the value of international jurisprudence is modified to a considerable extent by local legislation.

Another cause of confusion is the fact that Argentine patent and trade-mark laws are based on entirely different principles.

In the United States up to the present date about 1,300,000 patents have been issued for inventions and designs, and about 120,000 trade-marks have been registered. In Argentina on the other hand, since patent No. 1 was issued on Dec. 1, 1866, up to the present time, approximately 14,500 patents have been issued, and, since Dec. 27, 1876, when trade-mark No. 1 was registered, something over 52,000 trade-mark registrations have been made. That is to say, in the United States the ratio between the number of patents and trade-marks is more than ten to one in favor of patents, while in the Argentine Republic the proportion is about  $3\frac{1}{2}$  to 1 in favor of the trade-mark.

There is a reason for this inversed proportion in the two countries. In the United States as in Argentina, inventors' rights are based on priority of invention; whereas in the matter of trade marks, the laws of the two countries are diametrically opposed in principle. In the United States the mere fact of priority of registration does not hold against priority of use of a trade mark, so that registration is not necessary, although advisable, in order to protect the rights of the user of a brand. In Argentina, on the other hand, previous registration does prevail as against previous use, and for this reason it is absolutely imperative to register every trade mark used, and to do it before offering to the public the goods on which it is to be used.

## Argentine Patents

According to the Argentine Patent Law (No. 111 passed by Congress on Sept. 28, 1864 and signed by President Mitre on Oct. 11 of the same year) there are three kinds of patents, i.e.,

- 1—Patents of Invention;
- 2—Additional Patents;
- 3—Precautional Patents.

Patents of Invention are issued for 5, 10 or 15 years, the first two terms at applicant's option, and the latter or maximum term only to very important inventions originating in Argentina. The limit of time given to a patent for a foreign invention is 10 years, which can usually be obtained, always provided the foreign patent does not expire before the expiration of that term. The patent is not renewable on expiration of the term for which it is originally granted unless for reasons of force majeure the patentee is prevented from working the invention. Even in such cases the extension is

not provided for by law, but must be petitioned for administratively, and it has been granted in a very small number of cases. It is quite within the bounds of probability that some interesting cases of this nature may arise from conditions produced by the present world war.

Additional Patents are granted for improvements on an invention, already patented. They expire with the original patent unless granted after more than one-half of the term has expired, or if the improvement gives a reduction of more than one-half of cost or time of production, personal or property risks, or analogous results, in which case the Commissioner of Patents may decide what extension of the term may reasonably be granted. An additional patent may be taken out either by original patentee or by others, but in the latter case a royalty must be paid to the owner of the original patent, the amount of which is fixed either by mutual agreement or by the decision of the Commissioner of Patents.

Precautional Patents are popularly supposed to protect a partially developed invention until such time as it may be perfected when it may be converted into a regular patent. If this were really so, it would be similar to the United States "Caveat"; but the fact is that the law provides that if a second applicant applies for the same invention while it is covered merely by a "precautional patent," the two applicants are brought together and unless they come to an agreement no patent is granted to either of them; hence, this class of patent is only applied for by inventors who do not avail themselves of expert counsel.

In general, however, the Argentine Patent Law is good, and the protection afforded by a patent properly drawn up and based on real priority of invention, is ample. The punishment for infringement is sufficiently severe, including both fine and imprisonment besides the suit for damages which may arise out of the case; so that usually a simple admonition is enough to stop the repetition of the infringement.

## Novelty an Essential

A very general misapprehension exists arising from confusion of the patent with the trade mark laws, to the effect that a valid patent may be obtained by anyone, on an invention known and even patented in another country. Such a patent can only be obtained by false declaration as to novelty, and if an attempt were made to sue for infringement on it, a petition for annulment based on the production of published proof of previous public knowledge of the invention in any other country, would be successful.

The only valid patent based on a foreign invention is one which is applied for by the foreign patentee or his heirs or assigns, before the invention is worked in this country.

Many of the principal manufacturers of the United States are now aware of the importance of patenting their rights in Argentina before offering the patented article for sale here; since, if the article has already been manufactured here, or even sold either by the foreign patentee or any other person, such manufacture or sale constitutes previous public knowledge, and the foreign patentee would be barred from preventing such manufacture or importation, both of which might have been successfully avoided by applying for the confirmation of the foreign patent in time.

\*Abstract of a paper read before the American Commercial Club of Buenos Aires.

A small annual fee is due on each patent granted, excepting additional patents, and in order to keep the patent valid, besides the payment of these annuities, the invention must be "worked," i.e., either manufactured or offered for sale in this country, within two years from date of grant, and such working must not be suspended during any subsequent period of 2 years.

### Argentine Trade Marks

We now come to a phase of my subject which is of more general interest to merchants.

As previously stated, the Argentine Trade Mark Registration law is not based on the same principles as the Patent law. The fact that priority of registration is in most cases the only requisite to hold a trade-mark, and the additional fact that the law does not require the registrant to prove the fact that he is using the mark in order to register it, (as is the case in the United States) nor even to use the mark once registered, give the law a scope which in all probability was far from the intention of its legislators. While the object of such laws in all countries is to give protection to manufacturers and merchants in the use of their distinctive brands or emblems, the interest of the public in general is paramount in all legislation, and there is no doubt, not only that the public is not properly protected against imitations, when any person may register a well-known foreign brand and not only prevent the originator of the same from using it but also sell an inferior article under its name, but it is also a well-known fact that the law lends itself to a traffic in trade marks, thus making an article of commerce of what should be a protection to commerce.

Aside from this defect, the law is good, but in this particular it cries to heaven for amendment.

In the meantime, we must take the law as we find it, and like the patent law, it is a satisfaction to know that it is fairly administered by the authorities of the Argentine Patent and Trade Marks office, who nevertheless, like ourselves, must abide by it so long as it stands unamended or unrepealed.

There is only one alternative in view of the existing circumstances, and that is to apply for the registration of a trade mark before offering for sale any goods bearing it. This is so generally recognized by merchants here, that it is the usual custom to register all marks of any new goods received, not to defraud the manufacturers, but to prevent unscrupulous parties from defrauding them as well as the merchant. I could tell you of numberless cases in which reputable Buenos Aires houses have so done, advising the foreign manufacturer of their action and of its reason; but in the majority of cases the reason appears so absurd to the manufacturer that it is disregarded, and in some cases it even brings the merchant under suspicion, so that many have discontinued the custom of advising the home manufacturer for this reason. Now this may be all very well so long as the registration remains in honest hands, but an arrangement should in all cases be made between the manufacturer and the agent or merchant, to protect the former in case of the possible death or bankruptcy of the latter, in which case all trade marks registered in his name would be considered as an asset of the business, and might even be sold at auction, as has been done in several cases.

A notable exception to the general rule of the predominant value of previous registration, is the fact that according to the Argentine Law, personal surnames and portraits are protected. This rule is very strictly carried out by the Trade Mark Office, and when such names or portraits have been registered, it has always been by misrepresenting them as arbitrary or fictitious. When you hear of a foreign firm having been able to obtain redress in the Argentine courts for the improper registration of their names by unauthorized persons, you will find on investigation that it has been for this reason. But even in such cases, subterfuge has in some cases been resorted to by producing an individual of the desired name, making the petition in his name and assigning it afterward. This phase of the question is hard to avoid, as are legal subterfuges everywhere.

### The Things That Are Registrable

The Argentine Trade Mark Law (No. 3975, enacted Nov. 23, 1900, and which revoked all previous legislation) is now

what we must abide by in the registration of trade marks. By its enactments, the subject of a trade mark in general is similar to requirements in the United States, with the notable exceptions that proper names and geographical words are registrable, under a special form. Combinations of numerals are also registrable. The form given to the product itself is not registrable, but any novel form given to a container, if only for the purposes of identification and not of utility, may be registered to cover the class of goods sold in the container.

The registration is for the term of ten years, and is renewable indefinitely for like periods. The entire amount for the registration must be paid on filing the application, so that no subsequent payments are required until the time for renewal, when the matter is treated in all respects like a new application. If the registration is rejected, applicant may either substitute another mark by paying the additional expenses of publication, etc., or petition for the return of the payment made, except that portion of it which has been disbursed for reglementary public notices.

About ten days after filing, the application and facsimile of the mark is published in the *Boletín Oficial* for five consecutive days, and within thirty days from the last day of publication anyone deeming his rights to be aggrieved may file a protest. Unless in cases of evident fraud, however, this protest is useless unless based on a previous registration or the fact that the mark applied for contains the name or portrait of the person so protesting.

Afterward, the office makes a search, and if no objection is found, the mark is granted, at present about five months after application, varying according to the volume of applications presented at the office.

### Infringement Penalties

The penalty for imitation or infringement of a registered trade mark, like the case of the patent law, includes a fine and imprisonment, and the latter may not be commuted to a fine. For this reason, suits of this nature are very much dreaded, and it is not pleasant to become the defendant in such a case. The articles constituting the infringement are subject to seizure and sale in benefit of the Public Education Fund, and the defendant, if condemned, may be liable to a further civil suit for damages.

The names of firms, companies, merchants and manufacturers engaged in business in this country and duly registered or licensed as such, are protected by law without the necessity of registration as trade marks; nevertheless, they may be so registered, and since in the former case opposition must be made within one year from the time when a rival house with a similar name begins to do business under such name, while in the case of a trade mark the term for prescription of action is three years, or one year from the time when the facts came to plaintiff's knowledge, the advantage is evident and such registration is quite usual, even by local houses. In the case of foreign houses it is very necessary, since they do not enjoy the common law protections above mentioned.

Quite recently a new registry has been inaugurated within the Trade Mark Office, for such firm or company names, and for other designations applied to business houses rather than to their goods. This is available, however, to houses established here only, or to foreign houses with established agencies in this country.

Quite a general impression seems to exist that a radical change has taken place in Argentine trade mark legislation. This is not true. The law remains unchanged. It is true that in 1912 a new classification was adopted and the ruling made that each class must be registered separately, since previously it was possible to register a mark for all classes of goods for a single fee; while more recently another ruling has added the cost of advertising to the expenses of registration, and still more recently the new stamp law has even further increased the cost, especially in the matter of the legalization of the power of attorney. Furthermore, a few isolated decisions of the Chamber of Appeals have appeared almost to reverse its former sentences in the sense of being more favorable to foreign interests; but one swallow does not make a summer, nor does one sentence make jurisprudence, especially when in opposition to the great mass of decisions; and it will be safer to view the law from the standpoint of the prevailing mass of jurisprudence.

# Doman Tractor Engines

Made in Three 4-Cylinder Models to Suit Practically All Power Requirements—  
All Cylinders Are T-Head and Those of the Smallest  
Model Are Cast in Pairs

**T**HREE models of tractor engine are being manufactured by the H. C. Doman Co., Oshkosh, Wis. They are all of the slow-speed, heavy-duty type and were specially designed for tractor work. Each of the important features of design was given an exhaustive study before it was decided upon. Thus, for instance, although the T-head type of cylinder is somewhat more expensive to manufacture, the company has held to this type because it affords the opportunity to secure perfect water circulation all around the valves and to use valves of larger diameter, thus insuring the highest volumetric efficiency. As regards the grouping of the cylinders, the unusual wear of cylinder walls in tractor engines has been the deciding factor. If all four cylinders were cast in a block, any damage to one of the cylinders would prove exceedingly expensive. Therefore in the two larger sizes of Doman engines all cylinders are cast separately, whereas in the smaller size the cylinders are cast in pairs.

It is undisputable that a low-speed engine will outlast a high-speed engine, and in view of the fact that in tractor work engines are required to work under considerable load all the time, the Doman company has designed its engines to operate at comparatively low speeds of revolution. These engines are designed to develop their best efficiency at from 600 to 900 r.p.m., and it is the belief of the Doman company that a tractor engine should not operate at more than 900 r.p.m.

The illustrations herewith are of the small size, a four-cylinder engine of 4½ in. bore by 6-in. stroke, rated at 25-35 hp. This engine is designed for use on a three- to four-plow tractor. The piston displacement is 425 cu-in. and the weight complete of the engine is 800 lb. The cylinders are cast in pairs, of close-grained semi-steel and are of the T-head type with an unusually large water jacket around the valves. The cylinders are ground to size and are tested for leaks under hydraulic pressure. It will be noted from the sectional view that the cylinder heads are cast integral with

the cylinders, and there are large openings in the water jacket heads which are closed by plates to which the water return pipe is bolted. Pistons are made of semi-steel and are turned down to size. The wristpins are made of low-carbon steel, case hardened. They are hollow, are ground to size on the outside and are secured to the connecting-rod by a clamping bolt which passes slightly beneath the surface of the pin so as to prevent longitudinal movement of same.

The connecting-rods are drop forgings, of I-section, and are heat treated. The caps are secured by means of four bolts.

All crankshaft bearings are 2½ in. in diameter. The crankpin bearings are 2¼ in. long and the main bearings of the crankshaft are of the following lengths: Front and center, 4 in. each; flywheel end, 4½ in. This gives a total main bearing length of 12¼ in. The crankshaft is made from 35-45 point carbon steel, double heat treated and annealed. All bearings are ground to size. The crankshaft and crankpin bearings are die cast of high-duty babbitt, and are backed by bronze. The camshaft is supported in three bearings, of which the forward and center bearings measure 1½ in. in diameter by 1½ in. in length, while the flywheel end bearing measures ¾ in. in diameter by 2¼ in. in length. Hence the camshaft can be withdrawn from the engine through the forward end.

## Mushroom Type Cam Followers

The valves have a clear diameter of 2½ in. Their heads are of nickel steel and are electrically welded to the carbon steel stems. Valve operation is by push-rods with mushroom type cam followers. These are offset from the centers of the cams lengthwise so as to prevent the wearing of a groove. The timing gears are of 1½ in. face and cut with 10 pitch teeth.

The crankshaft and idler gear are made of 35-45 carbon steel, while the camshaft and accessory drive gears are made of semi-steel. A centrifugal water circulating pump is fitted to the engine, of sufficient capacity to cool it under the hardest working conditions.

The Doman engines are regularly designed for the use of gasoline, but the company has evolved a special exhaust and jacketed intake manifold which can be attached to the engine at a small extra expense. This manifold, it is stated, permits of the use of kerosene with any good make of carbureter. A horizontal fly ball type of governor is fitted, which controls the amount of mixture entering the intake manifold. The governor is inclosed in a dust proof case and is claimed to be non-racing. Ignition is by a high-tension tractor type magneto equipped with impulse starter. No batteries are used.

The crankcase is cast of semi-steel in two sections. All of the crankshaft bearings are supported by the upper half and the lower half contains only the oil troughs and the oil reservoir. There are four large hand holes with cover plates in the upper half of the crankcase, and as there is also a removable cover plate over

Part-sectional view of Doman Type HT engine

*Torque and horsepower curves of Type HT engine*

the gearcase, all of the working parts are readily accessible. Lubrication is by the circulating-splash system. There is an oil trough under each connecting-rod head, and the oil is circulated by means of a gear pump located under the forward bearing and distributed by means of a distribution pipe with openings opposite each trough. A branch from the distribution pipe feeds oil through a sight feed to the cam gear housing. The valve mechanism is inclosed by removable housings and the whole engine is of neat and trim appearance.

The radiator fan is driven by means of a flat belt off the crankshaft. The spark plugs are located in the caps over the inlet valves and the high tension cables from the magnetos are carried to them through a tube.

The second size of engine made by the Doman company has four 5 x 6 in. cylinders and is rated at 35-40 hp. It is also designed for use in three to four plow tractors. The construction features are much the same as in the smaller engines, except that the cylinders are cast separately and the valve springs are inclosed in tubular housings. The largest size of Doman engine has four 6 x 7 in. cylinders and is rated at 40-60 hp. It is designed for use in 4-6 plow tractors. This type also has individually cast cylinders and sleeve covers for the valve springs.

Special emphasis is laid by the Doman company on the finish of their engines. They are first given a heavy coat of filler and are allowed to dry thoroughly. They are then carefully sanded, after which they get a coat of sealer and are again allowed to dry. They are once more sanded before the final coat of enamel is put on. This gives the engines a glossy finish which will withstand heat and oil.

## Standardization of Milling Cutters and Small Tools

THE British Engineering Standards Association (by which name the Engineering Standards Committee will, in future, be known), at the request of a large number of manufacturers, who have felt that lack of standardization has hampered production and retarded progress, has recently formed a representative sub-committee to deal with the standardization of milling cutters and small tools. The work coming properly within the scope of Colonel Crompton's Sectional Committee on Machine Parts, he presided at a conference, at which the principal firms and associations interested, both makers and users, were present. Representatives were also present from the Ministry of Munitions Small Tools Department and Woolwich Arsenal. The subject was fully discussed, with the result that the meeting was unanimously in favor of standardization being undertaken. The sub-committee is under the chairmanship of R. Dumas, of the British Thomson-Houston Company, and a number of panel committees have been nominated to undertake the detailed study of the subject, as follows: Panel I, Form relieved cutters; Panel II, Non-relieved cutters; Panel III, End mills; Panel IV, Reamers.

On account of the pressure under which the industry is working at the present time, the committee have decided, in order to save the time of the members, that the work shall be carried out by these panels at convenient centers, those selected being Birmingham, Leicester, Manchester and Sheffield. The detailed reports of the various panels will be considered by the sub-committee sitting as a whole. In view also of the large amount of American machinery in England, it is hoped to establish close and direct co-operation with American engineers and manufacturers through the American Society of Mechanical Engineers; Continental practice will, doubtless, also be taken account of. It is quite realized that the work being undertaken, important as it is, will be largely in the nature of reconstruction work, and that the standards arrived at can only be introduced gradually on account of the amount of machinery already installed; yet, on all sides, expression has been given to the desire for such standards to be formulated without further delay, in order that gradually the present unsatisfactory position may be effectually ameliorated.

THE aluminum industry of all countries has been considerably developed since the war started. The annual report of the Swiss company at Neuhausen shows greatly increased output and large profits during the past year. A sum of some \$1,000,000 has been set aside from the gross profits of the year to provide further hydraulic power to extend operations.

# New Axle for Four-Wheel Steer Trailer

Standard Parts Co. Has Standardized Unit for 3½-Ton Design of Trailer with and Without Brakes

THE growing use of four-wheel steer trailers for both military and commercial purposes has led to some ingenious designs of axles for this purpose. By means of suitable axle arrangement it is possible to use trains of trailers of considerable length. One of the recent designs of axle brought out by the Standard Parts Co. is illustrated herewith and shows some novel developments in brake and steering layout.

The meritorious feature of this type of axle is that it is absolutely interchangeable for front and rear, and the axle can be used either with or without brakes and still have a large number of the parts interchangeable. The axle is intended for a four-wheel steer trailer such as is in quite general use at this time. It is intended to have one or two men riding on the trailer, and these men can operate the brakes on the trailer when necessary, thus enabling the train to stop much more quickly than if there were brakes on the rear wheels of the leading truck only.

## Layout of Brakes

The layout and operation of the brakes is probably the most interesting part of the axle, as it is a matter which is often approached with a great amount of diffidence by designers who fear the unusual combinations of linkage necessary for the operation of front wheel brakes. In the layout shown in the illustration herewith the pull rod operates on the lever *A*, which is attached to the shaft *B*. Pulling on the

rod through the brake lever causes the lever *C* to push down on the pin *D*. This pin is connected to the two equalizing plates *E*, which are in turn connected to the toggle links which expand the brakes. The brake is anchored by a U-shaped bracket *F*. It is apparent that the turning of the knuckle will affect the operation of the brake. It is also to be noted that the steering knuckles can be used on either end of the axle by turning them end-for-end and upside down.

If one of the two axles used on the trailer does not have brakes—and it is the usual practice to put brakes on one axle only—this is taken care of by simply omitting the brake drum and the brake operating parts, but using the same hub, thimble, king bolt, I-beam, etc. This gives a standardized type of axle which makes a good production proposition because of the fact that so many of the parts are duplicated regardless of whether braking is required or not.

WE have received from the Erie Specialty Co., 8 West Fortieth Street, New York City, a copy of the concern's catalog on standard aircraft metal parts. The Erie Specialty Co. was specially organized for the purpose of manufacturing aircraft metal parts, and has built up an efficient organization. The catalog lists the various aircraft bolts, nuts and clevis pins standardized by the S. A. E. A telegram code is given for ordering parts in a hurry.

Interchangeable front and rear axle for trailers

# Tractor Operating Cost in the Corn Belt

## An Analysis and Tabulation of Data Obtained from More Than 600 Farmers in Illinois—Relative Figures for 2-, 3- and 4-Plow Machines

**A**N increase in the number of farmers securing profits from the use of tractors is reported in a pamphlet on tractor experience in Illinois issued by the U. S. Department of Agriculture. Tractors do not increase the crop yields, but their advantages lie in labor saving, speed and adaptability for night work, states the report. The tractor has not reduced the number of horses used on farms but is replacing them in much of the work which they formerly performed. Ninety per cent of the tractor owners in Illinois reported profits from their tractors as compared with 80 per cent in the year preceding. Preference for 3-plow tractors was expressed by 76 per cent of the farmers, while more than three times as many 2-plow machines were found in use as 4-plow.

The present report is based on detailed reports from 359 tractor owners in Illinois made during the summer of 1917 and 284 reports made during the spring of 1918.

Inquiring for the principal advantages of the tractor for farm work the Department of Agriculture found that the ability of the tractor to do heavy work quickly is considered the principal advantage. The saving of man labor is next. The ability to plow to a good depth, especially in hot weather, is also emphasized. The availability of the tractor for night work is mentioned.

Under the leading disadvantages, the difficulty of efficient operation is the principal point named. Packing of damp ground is mentioned, as are also expensiveness, delays and inability to use the tractor for some work still performed by horses. That disadvantages are not emphasized to so great an extent as formerly is noted by the Department.

Small farms do not warrant tractors, says the report, but experience shows that where a tractor is purchased for a small farm, the farmer usually increases his farm to meet the capacity of the machine. One-third of the Illinois farmers reported increase of acreage farmed after they purchased a tractor. This is considered especially significant as there has not been a tendency to increase the farms recently excepting where tractors are used.

### Three-Plow Type Predominates

The 3-plow tractor outfit predominates, due, according to the Department of Agriculture, to experiences which show that large outfits are not economical for ordinary farm conditions and that the 3-plow outfit meets the requirements in acreage plowed per day and maintenance costs. It recommends the 3-plow tractor even on farms of comparatively small size, preferring it to the 2-plow tractor because the latter does not increase sufficiently the amount of work one man can do and does not, therefore, possess the great advantage of tractors over horses, namely, speed. Moreover the 2-plow tractor does not develop enough power for operating grain separators, ensilage cutters, etc. The average sizes of farms on which the 2-, 3- and 4-plow tractors operate satisfactorily are 180, 250 and 300 acres respectively. The 3-plow and 4-plow sizes seem to meet the best tractor requirements of the average Illinois farm since they enable speedy plowing, reduce man labor and are powerful enough to operate the various machines found on the average farm.

### Average Prices

The average prices paid for the three sizes most commonly purchased during 1917, in Illinois, were:

The 2-plow tractor .....	\$800
The 3-plow tractor .....	1,100

The 4-plow tractor .....	\$1,400
The 2-plow plow .....	115
The 3-plow plow .....	165
The 4-plow plow .....	235

Prices at the beginning of 1918, adds the report, were substantially higher than the above.

The life of a modern tractor, an important factor in determining its value for farm work, is uncertain as yet. The average use of the tractor is 45 days per year and replies to inquiries received show that 40 per cent of the tractors used required no expense for repairs in the first year. Those tractors between 2 and 3 years old averaged \$79 for repairs. The conditions under which tractors are operated, the rough and uneven ground and severe shocks to which they are subjected and their exposure to constant showers of dust and dirt are pointed out as causes for the excessive wear. This is being rapidly overcome, however, by the protection which the modern machines are given in construction.

Of 140 tractor owners in Illinois who had used their outfits one season or less, 48 reported that they spent nothing for repairs, the others had repair bills varying from a few cents to \$100 or more, the average being \$22, making the average repairs for the entire group about \$15. The figures obtained indicate that repairs are less among the 4-plow machines, but this may be due to the fact that the smaller outfits are more cheaply constructed. The report estimates an annual repair charge during the first 3 years of the tractor's life of about 3 per cent of the first costs.

### Work Done by 2-, 3- and 4-Plow Outfits

Figures provided by the Illinois tractor owners for days of 10 net working hours show that the 2-plow outfit plows  $6\frac{1}{2}$  acres per day, the 3-plow outfit 8 $\frac{1}{2}$  acres per day and the 4-plow outfit 10 acres per day. This, it is pointed out, does not coincide with the theoretical provision by which a 14-in. plow drawn by a tractor should cover 3 acres in a 10-hr. day, thus giving the figures of 6 acres per day for a 2-plow machine and 30 acres by a 10-plow outfit. The difference between the actual and theoretical figures is accounted for by the loss of time occupied by repairs and by possible unfavorable plowing conditions. A delay is frequently caused, it is pointed out, by a necessary repair on one plow which will naturally prevent the operation of the other 9 plows on a 10-plow outfit. Farmers are warned in the report against trying to make their outfits pull one more plow than they are rated to handle, as this tends to slow down the tractor and create mechanical difficulties according to the reports from those who are overloading their machines as compared with the farmers requiring their machines to pull only their normal loads.

The acreage covered per day at field operations other than plowing depends upon the relative draft varying with the width of the implement pulled. This makes it impossible to secure average figures which would be of value. In harrowing or disking for example the width of the implement pulled depends on the adjustment of the disks or harrow teeth and the depth of the ground worked. The nature of the soil also has an influence. The largest proportion of work done by tractors was found to be plowing and repairing the seed bed and in belt work. Hauling by tractor has been found less satisfactory and more expensive than by horses. Less than 20 per cent of the tractor owners reported doing hauling with their outfits.

The cost of operating, including fuel, oil and grease, re-

pairs, depreciation and cost of man labor, interest on investment, cost of housing, time spent caring for the outfit other than for repair work, etc., was found to be as shown in the following table:

Approximate Cost of Plowing an Acre with 2-, 3- and 4-Plow Tractors, Based on Average Cost of \$800, \$1,100 and \$1,400 Respectively, and a Life of 7½ Years of 45 Working Days Per Year

Size of Tractor	TOTAL*		FUEL		Oil	Grease	Repairs	Depreciation	Man Labor	Interest
	Gasoline Tractor	Kerosene Tractor	Gasoline	Kerosene						
2-plow...	\$1.58¼	\$1.33¼	\$ .50	\$ .25	\$ .05¼	\$ .02	\$ .11	\$ .36	\$ .46	\$ .08
3-plow...	1.47¼	1.22¼	.50	.25	.05¼	.02	.11	.37	.34	.08
4-plow...	1.80¼	1.25¼	.50	.25	.05¼	.02	.12	.42	.30	.09

\*The cost of housing the outfit and other minor overhead charges, such as taxes, insurance etc., are not included.

These costs are arrived at by allowing for a consumption of 2½ gal. of fuel per acre plowed, which is the average reported by the Illinois farmer. The replies indicated less difficulty from kerosene tractor owners than they encountered in 1916. Slightly more than 50 per cent of the Illinois tractors are operated on kerosene. The average price paid for gasoline in 1917 was 20 cents per gallon and for kerosene slightly less than 10 cents per gallon. In figuring the fuel costs extra allowance was made for warming up the kerosene engines with gasoline, estimating it at less than one gallon per day at a daily cost of 10 cents or one cent per acre plowed.

#### Lubricating Oil Quantities

The average quantity of lubricating oil was three-fifths of one quart per acre for all tractors reporting from Illinois. Some reported the use of nearly a gallon per acre while others used less than one pint per acre. With oil at 35 cents per gallon the average price paid, the cost per acre amounts to 5¼ cents.

Grease consumption averaged slightly less than one pound per day at a cost of 10 cents per pound, an average of 2 cents per acre. Based on these figures the average cost per acre for fuel, oil and grease is 57¼ cents where gasoline is used and 32¼ cents when kerosene is used.

The average annual repair charge was 45 cents per day used plus an estimate of 4 per cent of the first cost which the Department allowed against the original cost of the machine, making a total average repair charge per day of 71 cents for the 2-plow tractor, 11 cents per acre, 98 cents for the 3-plow tractor, 11 cents per acre, and \$1.24 for the 4-plow tractor, 12 cents per acre.

#### Annual Depreciation

Assuming the average life of a tractor to be 7½ years the average annual depreciation, based on the average costs is:

Two-plow outfit .....	\$106.67
Three-plow outfit .....	146.67
Four-plow outfit .....	186.67

The daily charge based on 45 working days per year is:

Two-plow outfit .....	\$2.37
Three-plow outfit .....	3.26
Four-plow outfit .....	4.15

The depreciation cost per acre based on the average acreage is:

Two-plow .....	36 cents
Three-plow .....	37 cents
Four-plow .....	42 cents

The cause of the high depreciation costs for the 4-plow machine is due to its higher relative price.

The average cost of man labor, estimated at \$3 per day, gives the cost per acre for man labor of 46 cents for the 2-plow, 34 cents for the 3-plow, and 30 cents for the 4-plow outfit.

Figuring interest at a fixed annual charge of 6 per cent on the average investment which is one-half the first cost, for the different sized tractors and using the basis of 45 working days per year the average interest charge per day is: 53 cents for the 2-plow outfit, 73 cents for the 3-plow outfit, and 93 cents for the 4-plow outfit. The interest cost per acre based on the average acreage covered by the different sizes is, therefore, 7, 8 and 9 cents respectively. Because the 4-plow outfit daily acreage does not increase in proportion to its cost, its interest charge is higher than for the 2-plow or 3-plow tractor. The increased acreage plowed daily by the 3-plow machine as compared with the 2-plow offsets the increased charge due to higher prices.

In addition to including the above figures for estimating the costs there are also such items as fuel and oil used for stationary work, but the Department of Agriculture considers these relatively small and unimportant. It points out that all of the above cost figures can be used as a basis for arriving at relative costs for other operations with the tractor.

#### Tractors vs. Horses

The cost figures, it is said, are approximately the same as with horses excepting for the item of man labor, which is lower with the tractor than where horses are used. This emphasizes that the advantage of the tractor lies not so much in the reduction of the cost as in the fact that it permits one man to do considerably more work in a given period of time. It is also stated that horse and tractor costs cannot be compared, since on farms where tractors are used a number of horses are also retained and comparisons must be made between the cost of operating horses alone and the cost of operating the tractor and a certain number of horses. Frequently horses stand idle while the tractor is being used and in such cases the cost of their maintenance must be considered in the farm operations costs, as they are as much a part of the farm power plant as the tractor.

A number of farmers according to the report hesitate to purchase tractors fearing that they will not work as satisfactorily as horses, especially in plowing. Fifty per cent of the tractor owners reported that the plowing work is better by tractor than by horse while less than 3 per cent say it is poorer. The quality of the plowing depends more upon the plow and its adjustment than upon the tractor. The selection of a good gang plow is important. It is quite possible that an inferior tractor pulling a good gang plow well adjusted will do better work than a good tractor pulling a poor plow or one out of adjustment. The average depth of tractor plowing in Illinois is slightly less than 7 in. as compared with 5½ in. previously plowed by horses. Eighty-six per cent of the Illinois tractor owners reported their tractors satisfactory for use on plowed land. The general use of automobiles is educating the farmer in the operation of the gas tractor and eliminating many of the operating difficulties farmers experienced in the earlier days. The department points out, however, that some farmers are making a mistake in assuming that boys can operate tractors efficiently whereas only a proficient operator can handle the tractor properly. It urges farmers to take advantage of tractor instructions offered by some tractor manufacturers.

#### Tractor Reliability

The reliability of the tractor depends largely on the ability of the operator. Fifty-four per cent of 300 tractor owners reported their outfits not disabled a single day during the past year. Of the remaining 46 per cent the tractors were out of commission 5 days on an average not including one man who stated his machine was out of commission about half of the time. Ninety per cent of the tractors owned in Illinois were reported operated by some member of the farmer's family, the best results being obtained by this class of operators. Thirty-six per cent reported no time lost in the field because of trouble with the outfit. The average time lost per day by the 64 per cent reporting trouble was a little over three-quarters of an hour.

Farmers purchasing tractors to displace horses are likely to be disappointed, according to the replies from the Illinois tractor owners. The tractor does displace the horse to some

extent, but only in about three-fourths of the cases where it is used on the same number of acres as were previously farmed, in which instances the horses displaced averaged about four and represent about three-fifths the cost of the tractor outfit. There is considerable work on the farm which the tractor cannot perform and which must be done by horses.

About 45 per cent of the tractor owners used their tractors to some extent for custom work. Some purchased their tractors with custom work in mind, while others procured them for their own farms only and undertook custom work at the request of neighbors. The Department of Agriculture states that the use of a tractor at custom work seems a reliable indication that the home farm is not large enough to utilize the tractor economically. One-third of the tractor owners reported that custom work was unprofitable. In view of the fact that the average farmer ignores depreciation charges and many other proper expenses, it is likely that considerably

more custom work was performed at a loss. The 47 per cent of tractor owners reporting custom work in 1917 averaged 17 days in the year at this work.

Despite the greater depth of plowing with the tractor, crop yields do not seem to have increased materially. The greatest percentage of owners report no noticeable effect either in increase or decrease of the crop yield, which might be attributed to the tractor.

That the farm tractor has developed more rapidly in the past few years than any of the field equipment for use with it, excepting the gang plow, is a point developed in the report. It is urged that maximum results with a tractor can only be achieved when it is combined with implements designed for it. A minimum of results is obtained when implements designed for use with horses are used. As the implements improve in design and are constructed especially for tractors it is expected a higher percentage of profits will result from tractors.

## Types of Small Electric Hoists and How They May Be Used

**I**N many places, and for many different kinds of work, the most economical means of lifting and hauling loads is provided by small electric hoists. Such hoists as those shown in the cuts herewith are capable of handling from one-half to five tons, and can lift at from five to ten times the speed of hand operated chain hoists. They have the further advantage of low cost, which is usually but a fraction of that of an electric travelling crane. Furthermore, they can be suspended at almost any point in the shop or can be used with shear pole, jib crane, a trolley running along an overhead track, or a small travelling crane. When used with a trolley or crane they can be moved about either by hand power or by means of a second electric motor.

One of the photographs reproduced herewith shows a large type electric hoist used in connection with an overhead track on which is fitted a travelling carriage driven by an electric motor. The other illustration shows one of the smaller type electric hoists, which in this case is attached to a trolley.

These hoists are controlled from the floor by means of pendant ropes. A brake, which is automatically applied when the controller is returned to the off position, holds the load suspended, and a safety switch automatically cuts off the current when the hook is hoisting to its safe limits of travel.

Special mechanical and electrical features are used in the construction of the motors to suit the service, which is equipped with the Westinghouse electric apparatus. The

direct-current motors are modifications of the series-wound crane type. The alternating-current motors are of the poly-phase squirrel-cage type with high torque, rotor windings. Three-quarter horsepower motors are used for  $\frac{1}{2}$ -ton hoists and 7-horsepower motors for 5-ton hoists, the ratings being figured on a 30-minute basis.

The controllers of the drum type are designed to break heavy currents without burning the contacts. When the tension on the control ropes is released, a spring returns the controller to the off position.

The hoists illustrated are built by the Yale & Towne Manufacturing Co. and are equipped with the Westinghouse electric apparatus.

### New Spring Wheel Design

**I**SAAC HAYMAN of Los Angeles, Cal., has designed a driving wheel for motor vehicles in which there is a series of coiled springs between an inner and an outer hub intended to absorb shocks and jolts. Spring holders screwed into the outer hub from the inside are provided with extensions moving in radial slots in flanges on the inner hub, so there is a positive drive from the inner to the outer hub. To insure smooth action between the inner and the outer hub flanges a circular row of balls is inserted between the two flanges on each side of the hub.

*Two types of small hoists operated by electric motors and controlled by pendant ropes. They are built by the Yale & Towne Mfg. Co. and equipped with Westinghouse electric apparatus*

## Getting Employees to a Distant Plant

Ford Company Uses Trucks and Trailers Between End of Street Car Lines at Eagle Boat Plant and Blast Furnaces More Than Two Miles Away—A Regular Schedule Maintained

**A**T almost any hour of the day, should you happen to be in the western outskirts of Detroit—out Michigan Avenue or Fort Street—you may see a crowd of workmen lined up along the curb of the street and wonder why they are there. Your curiosity will soon be partly satisfied by the arrival of a khaki-colored bus pulling a like-colored trailer of about the same size.

You will see the men step into the vehicles in orderly fashion and seat themselves on the long seats at each side. About a minute later you will see another conveyance arrive and take some more men away. You will see a procession of vehicles—one after another arrive and depart quickly with capacity loads of human freight. You might ask where all these men were going, and the answer would come: "To Henry Ford's big shipbuilding plant and blast furnaces at River Rouge."

### Transportation Needed Quickly

Almost as soon as ground was broken for these mammoth plants, a means of transporting the workers to and from the site became a problem—but not one of difficult solution. The nearest car line was 2 miles distant; men could not be asked to walk so far back and forth every day. Such a walk, after a hard day's work, is not taken with relish nor with profit by the majority of men.

A transporting scheme had to be devised—and quickly. There was nothing else to do. So to be assured of workers, Henry Ford suggested the bus idea. But where were the trucks to come from? No such conveyances as could be used for this service were immediately available. But a manufacturer who has a record of building a car a minute and executing other tasks on a similar scale can be counted on to solve such a comparatively simple problem quickly.

Twenty-four hours after the plan was decided upon, three trucks with trailers were in operation carrying workers to the plants. All the material was at hand, it simply remained for someone to assemble it and build up the trucks. The regular Ford ambulance chassis was used and upon it was mounted a specially built body with leather upholstered seats at the sides.

The first vehicles were put in commission on March 1,

and to-day there are twenty-one in the service with three more to be added very shortly. The service was built up to 17 trucks within its first 2 weeks. As many as 7800 men are carried during the course of a day. Not all these men work for Ford directly, however. A number are engaged in construction work for outside interests, such as contractors and builders, as the erection of all the buildings is not yet completed. The men of five different companies are served by the bus line. Of the total, about 50 per cent are Ford employees.

On July 2, between the hours of 5.45 a. m. to 8.15 a. m., a total of 3720 men were carried—1545 from Fort Street and 2175 from Addison switch. From the Fort Street car line it is a distance of 2 miles and takes 6 minutes to make the trip. Addison switch is 2½ miles from the plant, but this route takes almost twice as long because of the bad brick road traveled part of the distance, and because of frequent delays at railroad crossings of which there are eight. Thirty-four hundred and forty passengers were carried during the same morning period on July 1 and 3655 on July 5, when 70 trips were made. The biggest rush is manifested between 6.10 a. m. and 7.30

a m., at which time capacity loads are always carried.

After this morning shift men start coming in again for the afternoon shift at 1.30 p. m. Bus service is maintained from this time uninterruptedly until 11.30 p. m. The afternoon shift starts at 3.30 p. m., and by the time all the men have arrived those who are quitting are ready to use the busses to take them back again to one of the car lines or termini of the bus line. This departing service which starts at 3.15 p. m. and ends at 11.30 p. m. overlaps the previously mentioned schedule, namely: 1.30 p. m. to 6.30 p. m. All these schedules utilize the entire number of busses.

For the night schedule which starts at 11.30 p. m. and ends at 8.15 a. m. only seven cars are operated. This also overlaps another schedule—the first one which begins at 5.45 a. m. The commencing of this latter schedule brings into service the other fourteen cars, making the total twenty-one again. To put it in other words, the service is almost unceasing. There is a lapse of only 5 hours and 15 minutes—from 8.15 a. m. to 1.30 p. m.—when the busses are not needed on the road because there are no changes in shifts at this period. During this period, however, the trucks are not idle, but are utilized in conveying materials from one part of the plant to another.

There are 3600 Ford employees benefited by the bus service. Within 30 days it is estimated that 10,000 names will be on Ford's payrolls of these two plants and more vehicles will be pressed into service.

It takes 110 men, including the repair men and garage

clerks, to operate the bus line. Each bus has two men—a driver and conductor who work in 8-hour shifts. While on the road the conductor travels on the rear step of the trailer and when a railroad crossing is approached the bus is brought to a dead stop. Here it is his duty to jump off and cross the tracks and signal the driver if it is safe for the vehicles to proceed.

A report of all passengers carried is made out by the conductor each shift. At both termini of the bus line are men—usually the foremen of the shifts—who check all cars as they leave. The reports that they make out include the bus number, the total number of passengers of each and the time the vehicle leaves. This report proves valuable evidence when frequently workmen arrive late for work and attribute their tardiness to a delay of a bus. A glance at the report will instantly reveal whether or not the bus service is to blame.

At the garage is a bus register which gives the badge number of the driver, his name, his destination, the bus number, time he left and the time he came in. This serves to show at all times just who is driving each car and on what route he has been assigned.

The cost of operating these vehicles has not yet been definitely determined, but estimating the cost on a basis of a capacity load it equals 2 cents to 3 cents a mile per man for gas, oil and repairs. This is not taking into consideration the cost of labor. When the service was first established the cost was estimated at 4 cents, but when it became systematized it was brought down about 50 per cent.

## The Proposed Transatlantic Flight

ONE of the most daring proposals to which the war has given rise is that to fly aeroplanes built in the United States across the Atlantic Ocean to the battlefields of France. Large numbers of planes of all kinds are wanted on the battlefield, and are wanted quickly, too. The production of planes and of engines for them is rapidly rising, and if one asks the engineers connected with aircraft production as to the possibilities in the way of output during the next several months, the usual answer is that they can make all that can be transported across to France. Hence, the shipping situation has become the limiting factor in the aircraft program, and though ship construction is being pushed with the utmost vigor, there is little chance of this situation being materially changed for months to come. That is, our capacity for producing planes will continue to run ahead of our ability to transport them across the ocean.

If the planes could be flown across this would solve a most perplexing problem. Of course, only planes of the type of large long-distance bombers could be expected to make the flight successfully, for it would be necessary to carry not only a fuel supply sufficient for some 2000 miles flight, but reserve pilots as well. The plan of plane drive-aways, we believe, originated in England, in connection with a large bomber type plane of British design which is to be manufactured in this country.

It is easy to foresee numerous difficulties and dangers besetting an undertaking of this sort, and it is almost a certainty that a fraction of the departing machines would be lost on the way. This, of course, does not disprove the practicability of the scheme, as some machines would be lost even if they were sent abroad on board ship. The proportion which can be gotten to their destination safely is the all-important factor, and this can be determined only by actual trial. If it is decided that the chances of success are sufficient to warrant a trial, we may be sure that the greatest precautions will be taken to prevent loss at sea, by distributing station ships along the proposed route of travel, and in various other ways.

If planes of well tested construction are selected, the most experienced and capable drivers picked and station or signal ships are placed at reasonable distances apart all along the line of flight, the scheme would seem to have a reasonable chance of success. Non-stop flights of nearly the distance required to be traversed in this case were made several years ago with much smaller machines than are now available. Undying fame awaits the pilot who first succeeds in completing the aerial journey from the New World to the Old, and volunteers will not be wanting to guide the machines across the big expanse of water.

In this connection it may be said that the offer of large cash prizes, which under ordinary conditions might have been a strong incentive, will have little effect on the materialization of the scheme. If it can be carried out successfully, its consequences from a military standpoint are so enormous that the prizes offered pale into insignificance in comparison.

## Value of the Notch Bar Test Questioned

IN Europe the notched bar test or impact test has come into extensive use of late years for detecting brittleness in steels, but some engineers of high standing are far from being convinced of its practical value. This test consists essentially in letting a heavy hammer arranged as a pendulum drop from a certain height, break a notched test bar of specified dimensions when in its lowest position and noting the height to which the pendulum rises after having broken the test piece. The difference in height at the beginning and end of the swing multiplied by the weight of the hammer gives the energy in foot-pounds absorbed in breaking the test piece. The theory is that the tougher the steel the more energy will be required to break the specimen and

that a steel which absorbs little energy in the impact test must necessarily be brittle.

The test has been applied mainly as a check on heat treatment, and it appears that there has been a great deal of difference of opinion as to its suitability for the purpose. One argument made against the test is that it subjects the steel to strains unlike any to which it is subjected in regular work. This does not apply to the tensile, transverse and similar tests. The notch in the test bar concentrates the strains at one point, and a similarity of conditions might be claimed for more or less sharp shoulders on shafts, etc., but these in practice are never subjected to such extreme shocks that a single shock suffices to cause the part to fail. A test which subjects the material to exactly the same sort of strains as those it has to bear in regular work certainly meets with the greatest amount of confidence on the part of engineers and properly so.

One thing that has served to shake faith in the

impact test is its absolute lack of correlation to the micrographic test. This was brought out in the discussion of a paper on Round Test Specimens for the Impact Test, read before the Institution of Automobile Engineers some time ago. One of the speakers mentioned that a piece of nickel chrome steel, oil-hardened at 1830 deg. Fahr., reheated to 1150 deg. Fahr., and quenched in water would show a most objectionable looking structure, yet would test about 50 ft.-lb. on the Izod impact machine, whereas the same steel oil-hardened at 1475 deg. Fahr., reheated to 1150 deg. Fahr. and cooled slowly, though showing a beautifully fine grain structure, will only show about 15 ft.-lb. on the impact machine. From the micrographs most every engineer would pick the last-mentioned specimen as the better one.

It would thus appear that the long established practice of determining the elastic limit, breaking strength, contraction of area and extension is more reliable than the use of the impact machine.

## The Case of the Truck and the Case of the Passenger Car

EVERYONE connected in any manner with the industry can, and probably does, find much justifiable satisfaction in the way the case of the motor truck was presented before the Priorities Committee of the War Industries Board. It was a good job, well done.

When those of us who are in the industry read the statement which the representatives of the truck manufacturers presented to the committee, we are filled with a feeling of gratification at the thought that we are devoting our energies to something so well worth while. Not only that, but we are pleased that the facts substantiating the essential character of the motor truck have been so clearly presented that they cannot possibly escape comprehension, with the resulting benefit that the country, at this time when it needs so badly just what the motor truck can give, will not be denied its help, as it might have been, through a failure to realize how great that help can really be.

It was a simple, direct, dignified, convincing statement. In the most sincere manner it indicated a

desire on the part of the makers to co-operate with the Government. It expressed an honest conviction which it backed up with logical evidence "that trucks used in this country are necessary to a swift winning of the war," and asked for the committee's careful consideration of the request for steel and fuel priorities "on this basis alone."

The case of the motor truck is clean cut. It seems to many of us to be almost obvious. The utilitarian value of the truck is very close to 100 per cent. A few incontrovertible and almost self-evident facts logically presented form a conclusive argument establishing its practical worth. In the case of the passenger car, on the other hand, the facts may not be so apparent. They are, nevertheless, just as real and just as capable of being demonstrated even if some different method must be employed. In its case volume of testimony must be relied upon. And there are large volumes of it to be had. Some day, perhaps, it may be compiled and the real case of the passenger car presented. For the good of the country as a whole that day cannot come too soon.

## Recognition from Abroad

WHATEVER efforts have been made to belittle the engineering achievement represented by the Liberty aircraft engine have by this time been pretty well nullified, but it is interesting, nevertheless, to observe that the head of the British Air Service, Sir William Weir, speaks of the engine in most appreciative terms. It was on the occasion of the Sixth Wilbur Wright lecture, recently delivered to the Aeronautical Society by an American scientist, Dr. W. F. Durand, at which Sir William Weir presided. At the conclusion of the lecture, referring to the aircraft situation in general and the materials question in particular, Sir William stated that thorough and searching tests recently applied in France and England to the Liberty engine had justified the prediction that it would prove a most

valuable contribution to the Allied resources, and that the United States could go ahead and push these productions with every confidence. The results so far obtained placed the engine in the very first line of high powered aeromotors.

This testimonial to the qualities of the Liberty engine is the more acceptable for the reason that much of the criticism which has been passed upon it originated with interests connected with foreign-designed engines. It is no longer necessary to accept the word of those responsible for the Liberty engine that it has made good in every respect; we now have the word of the highest authority on aircraft matters in England, supported by thorough and searching tests, that the Liberty engine ranks in the very first line among engines of its class.

## Tax Cars and Trucks On Cost

Federal License in Addition to  
Impost on New Vehicles—  
2 Cents per Gallon on Gas

WASHINGTON, Aug. 1—A heavy excise tax, a tax of 10 per cent on new cars and 5 per cent on new trucks, and a tax on gasoline were written into the new Revenue Bill by the Ways and Means Committee yesterday. The excise tax includes cars, trucks and motorcycles and will be in the form of a Federal license tax, and in the case of cars and trucks is graduated according to the original cost of the machine. The tax on motorcycles is \$5 regardless of the original cost.

The graduated tax which will yield about \$125,000,000 annually, will operate under the following schedule:

Not over \$500, annual license.....	\$10
Above \$500, not over \$750.....	15
Above \$750, not over \$1,000.....	20
Above \$1,000, not over \$1,500.....	20
Above \$1,500, not over \$2,000.....	40
Above \$2,000, not over \$2,500.....	50
Above \$2,500, not over \$3,000.....	60
Above \$3,000, not over \$3,500.....	80
Above \$3,500, not over \$4,000.....	100
Above \$4,000, not over \$4,500.....	120
Above \$4,500, not over \$5,000.....	140
An additional \$40 for each \$1,000 of original cost above \$5,000.	

The tax on gasoline of 2 cents per gal. is expected to raise \$45,000,000. The Committee believes a gasoline tax will lead to a considerable conservation of gasoline reducing its needless use in passenger cars. This is the sole purpose of placing this gasoline tax.

A tax on used cars through a tax on dealers is also contemplated by the Ways and Means Committee. Chairman Kitchen thinks that some method of taxing used cars will be found as they would escape taxation under the methods already agreed upon.

The graduated tax on cars and trucks undoubtedly will encounter a struggle in the Senate where the Finance Committee has stated where it will never agree to a tax of this sort which is unfair because of the reduction in prices of cars affected during the last few years by better production methods and lower cost of materials. They state that the plan is unfair to the motorist who owns a car several years old to have to pay a higher tax than the motorist who owns a car two or three years old. This should be reversed, states the Finance Committee.

The graduated tax on trucks is tentative. There will probably be a lower graduated scale arranged, to apply to trucks only, as the committee has displayed some understanding of the utility

of the motor truck, having applied but 50 per cent of the car tax through the manufacturer to the motor truck.

The tax on gasoline is to be paid by the manufacturer or producer but it is expected that it will be passed on to the consumer by them.

DETROIT, MICH., Aug. 1—Manufacturers expect that a general increase in the price of cars and trucks will follow the passage of the proposed taxation measure, but they hold out hope that the \$70,000,000 which the tax is expected to raise is an indication that the government will permit them to get sufficient steel to enable a production somewhat better than had been hoped for. It is freely predicted that the burden will fall upon the purchaser and fear is felt that this will have a marked effect on sales.

### Define War Work

WASHINGTON, Aug. 1—The Department of Labor defines war work as follows:

1—The manufacturer of products or erection of structures directly or indirectly supplied to some department of the government for use in connection with the war. Indirectly supplied includes goods delivered under sub-contract to government contractors.

2—Coal mining is wholly war work.

3—Railroads and farms are engaged in war work and will be protected from all recruiting by other industries.

### Daniels Opposes Air Ministry

WASHINGTON, Aug. 1—Any effort by Congress to create an air ministry to control the production of aircraft will be opposed by Secretary of the Navy Josephus Daniels. He said yesterday there would be no more single reason for establishing control over aircraft by means of a ministry than there would be for establishing a ministry control of submarines in the War Department.

### Winningham Named Oil Chief

WASHINGTON, Aug. 1—C. C. Winningham one of the principal stockholders of the Hudson Motor Car Co., who has had charge of the Hudson product for the last 8 years and of its advertising has been appointed chief of the Gasoline Section and Director of Publicity of the Oil Division of the Fuel Administration under W. C. Robinson, who is director of the Bureau of Oil Conservation. The work of Mr. Winningham will include the elimination of gasoline waste by distributors and users, the conservation of lubricating oils, and the inauguration of methods for reclamation of oil that has been used.

## 40,000 See Tractor Demonstration

112 Machines Started at Once—  
Need for Better Engineer-  
ing Is Voiced

SALINA, KAN., July 31—The annual National Tractor Demonstrations being held here are proving to be the greatest demonstrations by far that have ever been held.

To-day over 40,000 witnessed 112 different tractors working in one huge field a mile in width and nearly half a mile long. Promptly at 1.30 all of the 112 started across the field, some pulling ten plows and others pulling different numbers, down to the smallest sizes that pull but two.

No sooner had these 112 started turning over the fertile winter wheat acres of the State than 27 other tractors, drawing every other conceivable form of farm machinery came on the plowed soil and demonstrated the all-conquering aspect of the tire. The mile of tractors waiting for the starting signal called to mind a veritable tank attack, the industrial tanks of the army at home that are doing their part to produce the food and other necessities for our army, on the other side of the ocean.

The spirit of co-operation among all of the tractor makers has never been so generally apparent as this year. There is on every hand nothing but the best of team work. This spirit was well displayed at the dinner of the Society of Automotive Engineers to-night when F. P. Mount of the Advance-Rumely declared that the bringing out of better tractors is the best thing for the industry no matter whether those tractors come from old line concerns or from newer firms in the automobile or allied industries. Better tractors are needed and due recognition must be given them no matter where they come from.

J. A. Everson of the International Harvester Co. told of the great educational work his concern is doing in educating farmers to the more intelligent use of tractors. His company has conducted upward of 600 different schools of instruction, and in these farmers using different makes of tractors attend; in fact, 30 per cent of the farmers own tractors of other makes.

J. B. Davidson of the University of California, who has been conducting the drawbar and belt tests at the demonstrations, declared that more engineering is needed in several tractors, and that the engineer must take a stronger place in

## To Cut Tire and Tube Production 50% During August and September

War Industries Board "Requests" Restriction and Would Curtail  
Use of Cars—Allocation Rate Little Changed—  
Rubber Section of War Board

NEW YORK, Aug. 1.—The War Industries Board has requested the rubber industry to cut down the production of pneumatic tires and tubes during the months of August and September to 50 per cent of its production during the same months of 1917, and has placed itself on record as expecting that the use of tires will be restricted to war and essential business purposes. It has further let it be known that steps are now being taken to restrict the use of tires to such purposes, but no inkling of the steps to be taken has been permitted to become public.

The request to cut tire production during this two-month period really amounts to an order, and follows a recommendation made to the War Industries Board by the War Service Committee of the Rubber Association of America, that such a step be taken. The War Service Committee also suggested that the use of tires be restricted to essential war and business purposes and as a means to this end has proposed a Federal licensing system for cars and trucks so that every one may be checked up and the essential or non-essential character of its purposes definitely known.

### 600 Representatives Present

More than 600 representatives of the rubber industry gathered at the Waldorf here today to go over with the War Service Committee of the Rubber Industry its recommendations for the importation, allocation and use of rubber, following the closing of the first quarter of the year during which Government restrictions on imports were to be effective.

Last April, the Government ruled that during the three-month period commencing May 6 and ending July 31, only 25,000 tons of rubber might be imported, and that during the year, May to May, the total importation might be only 100,000 tons. The expiration of the period was the occasion for the gathering.

In consequence of recommendations made by the War Service Committee, the next period is to be of only two months' duration, the understanding being that in that period the rubber industry is to furnish the Government with additional data upon which to decide what quantities may be imported during the remainder of the year.

The War Trade Board has ruled that

during the months of August and September, rubber may be imported at the same rate as for the initial quarter of the year, i. e., at the rate of 100,000 tons a year. The rate of allocation by the Rubber Association of America, however, has been slightly altered. During these two months, consumers will have rubber allocated on the following basis:

(a) Government requirements are to be supplied in full;

(b) The remainder to be allocated to consumers at the rate of three-eighths of their consumption during the same period last year. (In the first quarter the rate was one-quarter of seven-sixteenths.)

(c) New consumers will have rubber allocated in proportion to their mill or churn capacity.

### No Hardship Anticipated

Although the production of tires and tubes is to be cut down 50 per cent during August and September, it is not anticipated that this will cause any great hardship on dealers. The restriction applies only to manufacture, and inasmuch as many tire companies carry fairly extensive stocks on hand, it will be possible for them to supply current demand from these stocks.

The burden apparently will fall most heavily on small manufacturers, and particularly on those who have either started since August, 1917, or who had very small production at that time. At the request of a majority of those present, the War Trade Board is to be asked for a ruling which would permit all manufacturers to base production during August and September on 50 per cent of their average production during the first 6 months of 1918, though small hope is held out that such a ruling will be obtained.

### Textile and Rubber Division

So that there may be closer co-operation between the War Industries Board and the rubber industry, a new section of the War Industries Board has been created. This will be known as the Textile and Rubber Division and is headed by John W. Scott, who will have supervision over textile matters. Henry T. Dunn, president of the Fisk Rubber Co., Chicopee Falls, is head of the rubber section.

In presenting its case before the War Industries Board, the War Service Com-

mittee reviewed at length the various uses to which rubber is put. It pointed out that the entire importation of rubber during 1917 only occupied 3.6 per cent of the total shipping tonnage entering Pacific ports, though it represented 28 per cent in the value of all imports. Now, due to improved packing methods, the same quantity of rubber can be carried in 2.7 per cent of the shipping tonnage.

The committee completed its presentation with an urgent plea for more rubber, stating that unless more is permitted to come in the Government will find itself seriously handicapped for lack of it. Following is practically the complete report of the committee:

The War Trade Board, pending the further ascertainment of facts, limited the amount of crude rubber which might be imported, and has, for the months of May, June and July, 1918, specified the amount of such importation to which each manufacturer is entitled as evidenced by allocation certificates issued by the War Trade Board, each manufacturer being permitted to receive for three months (exclusive of rubber for Government contracts) one-quarter of seven-sixteenths of the amount of crude rubber which it received throughout the year 1917. In this the War Service Committee fully acquiesced as an emergency measure. But operation under these restrictions for approximately three months has shown conclusively that, if the same restrictions are continued for any prolonged period, a serious situation will arise which will handicap the Government in securing some of its most important supplies to meet the urgent war demands. The situation is such that there must be either an extremely radical reduction in production or an increase in importation of crude rubber—or both.

The greater part of the crude rubber imported comes from the British and Dutch possessions in the Far East, and most of this arrives at Pacific ports. The amount so imported in 1917 occupied 3.6 per cent of the total shipping tonnage and constituted, in value, 28 per cent of the importations to the Pacific Coast ports. Under a new method of packing, this quantity of rubber will occupy only 2.7 per cent of the shipping tonnage. The details of this are set forth in Exhibit B in the Pamphlet of Exhibits accompanying this memorandum.

The amount of rubber used in 1917 in the production of various classes of goods, as compiled from 448 replies to 503 questionnaires sent to the trade, is set forth in Exhibit C. From this it appears that the crude rubber consumption in 1917 was nearly 160,000 tons, whereas the Government is working on the basis of allowing only 100,000 tons per annum.

Coincident with this decrease in the permitted supply of crude rubber, the demands for manufactured articles has increased; for instance, the increase in the demand for truck tires, which are essential to war activity and transportation, is fourfold, and the increased demands for such essential articles as footwear, surgical materials, etc., are also very substantial. In 1917 the tonnage

(Continued on page 210a)

## Economy Records Attained by Airplane Mail Service

WASHINGTON, July 27—Reports of the comparative cost of operation and maintenance of the air mail service shows records attained for economy for gasoline consumption. The total operating expenses of 9 airplanes aggregating 7234 miles of flight was \$2,682. Total gas consumption for 113 hours and 8 minutes of flying was 1377 gallons, which is \$32.50 per hour, approximately 50 cents a mile.

The average consumption of gasoline for the 9 planes was 12 gallons per hour.

A Curtiss JN 4 machine flying 26 hours and 40 minutes at a cost of \$28.01 per hour covered 1719 miles at a cost of 43½ cents per mile. A Hispano-Suiza 150 hp. engine equipped plane used 8 gallons of gas per hour. A plane equipped with a 400 hp. Liberty engine used 17 gallons of gas per hour. This figure is about 40 per cent less than is generally required for airplane engines of these sizes.

The total operating cost mentioned above includes departmental overhead charges, interest on investment, parts replacement, mechanic's time, gasoline and lubricating oils, motorcycles and trucks, rent, fuel, light, telephone, pilots' salaries and salaries of hangar attendants.

### Detroit Aircraft Bureau Moves

DETROIT, July 29—The Bureau of Aircraft Production has been moved from 870 Woodward Avenue to the fourth floor of the Ford Motor Co. branch, and the entire working force of more than 200 people is now at work in the new quarters.

### Rapid Growth of Aeronautics Department

WASHINGTON, July 29—The Department of Military Aeronautics, recently organized, has grown to include more than 1000 civilian employees in addition to the officers and enlisted men. Thirty stenographers and 50 typists are needed by this department, particularly those who are qualified to take dictation and

make transcription in both French and English. Applicants should call upon or address the Civilian Personnel Office, Department of Military Aeronautics, Building B, Sixth and B Streets, N.W., Washington, D. C.

### 624 Men Called for Aircraft Board

WASHINGTON, July 24—Provost Marshal General Crowder to-day issued a call for 624 limited service men for duty with the Aircraft Production Board. The majority of them will report for work at various mechanical trades at Kelly Field, San Antonio, Texas. Twenty-four of the men will perform clerical work here in Washington.

### Aircraft Investigation in the East

WASHINGTON, July 24—Attorney-General Gregory, Charles E. Hughes and W. L. Frierson will make their headquarters in New Jersey for the time being to resume hearings in the aircraft investigation they are making.

### Three Deaths at Aviation Field

WASHINGTON, July 27—Three deaths occurred at aviation fields in the week ending July 20, representing one fatality for every 7926 hours flown or 634,080 miles of air travel. Following is the summary:

Brooks Field, San Antonio, Texas.....	1
Kelly Field, San Antonio, Texas.....	2
Total .....	3

### Bosch-Owned Bicycle Plant Taken

READING, PA., July 28—The Reading Standard Motorcycle and Bicycle Co., which operates a plant employing 300 workmen, has been taken over by the Government on the direction of A. Mitchell Palmer, alien enemy property custodian. The Bosch Magneto Co., of New York, already taken over by the Government, is said to be the owner of the controlling interest in the Reading Standard Company. A. T. Murray and A. E. McGavin, Government agents, have been made president and general manager, and the company is now filling Federal orders.

## Philadelphia Aircraft Plant Completes 50 Flying Boats

WASHINGTON, July 27—The first order for 50 naval flying boats placed with the new navy aircraft factory at Philadelphia has been filled and the greater part of the machines are now flying over British waters. This was revealed to-day in a statement by Secretary of the Navy Daniels. The first flying boat had a successful trial flight on March 27.

The forms for the first boats were laid October 12, 1917, despite the fact that the factory building itself was not completed until November 28. These facts prompted Secretary Daniels's letter containing these statements and felicitating Naval Constructor F. G. Curn, who is in charge of the naval aircraft factory.

The contract for the aircraft factory was awarded August 6, 1917, and work began the same day. The original factory had 160,000 sq. ft. of floor space. An extension adding 55,400 sq. ft. was begun February 26, 1918, and is now completed.

### Chevrolet Price Increased

FLINT, July 29—The Chevrolet Motor Co. will increase the prices of its models on Aug. 1 as follows:

Model	Old Price	New Price	Increase
Baby Grand.....	\$995	\$1,095	\$100
4-90 .....	685	735	50

### No Gasoline Restrictive Measures

WASHINGTON, July 27—Due to considerable uncertainty among users of gasoline, the Oil Division of the United States Fuel Administration announced that there are no restrictive measures in force. A campaign will be launched shortly to eliminate the great waste of gasoline and lubricating oils which occurs in garages, repair shops, service stations, etc. The campaign will be headed by the slogan "Stop the leaks and save the drops."

### Loco-Tractor Invented by Ford

DEARBORN, MICH., July 29—A tractor locomotive has been invented by Henry Ford and is now being experimented with at the tractor plant at Dearborn. It is a regular tractor fitted with flange wheels which are connected with a driving rod, and is capable of developing enough power to draw eleven loaded trucks. The device is only in an experimental stage but is very likely to be produced on a large scale.

The Loco-Tractor, as it is styled at the plant, could be used at a great saving in large manufacturing plants, rice fields and copper and coal mines where it could do the work of scores of horses and mules. In tropical countries it is believed the Loco-Tractor could be used to draw passenger trains. Ford is experimenting with it at his tractor plant in drawing sand to fill in a small lake which borders the property.

*Ford's Loco-Tractor is capable of developing enough power to draw eleven loaded trucks*

## De Palma Victor at Chicago

Breaks Two World's Records  
in Races—Wins 20-Mile at  
Rate of 110 M.P.H.

### TWO-MILE

Driver and Car	Time	M.P.H.
Resta	1:18.0	92.3
Chevrolet, Frontenac	1:18.4	91.7
De Palma, Packard	1:19.0	91.1
Mulford	1:20.0	90.0
Vail	1:42.0	74.2

### TEN MILE

Driver and Car	Time	M.P.H.
De Palma, Packard	5:24.8	110.8
Chevrolet, Frontenac	5:25.0	110.7
Resta	5:26.0	110.4
Mulford	5:26.2	110.3

### TWENTY MILE

Driver and Car	Time	M.P.H.
De Palma, Packard	10:50.2	110.7
Resta	10:51.6	110.4
Mulford	10:52.0	110.04
Chevrolet, Frontenac	10:52.2	110.03

### THIRTY-MILE

Driver and Car	Time	M.P.H.
De Palma, Packard	16:54.8	106.42
Chevrolet, Frontenac	16:55.8	106.30

CHICAGO SPEEDWAY, July 28—Ralph De Palma in a series of spectacular races here to-day took first place, incidentally breaking two world's records. All the races were hotly contested, with the lead usually alternating between De Palma and Chevrolet, who drove the Frontenac with its usual steady gait.

Resta got his car going well in the first race and took the 2-mile event in 1:18, or at 92 m.p.h., the slow time being accounted for by the standing start. Duray broke the rear axle shaft of his Frontenac a few seconds after the field got under way, scarcely having moved 100 ft. from the starting line.

The 50-mile race was abandoned after three laps had been run on account of rain.

When the smoke of battle had finally cleared De Palma had 22 points safely tucked away, Chevrolet 18, Resta 15, Mulford 10 and Vail 2.

All the races except the 2-mile were from flying starts. In the first race Resta was followed closely by Chevrolet, De Palma, Mulford and Vail in the rear and suffering from ignition trouble.

In the 10-mile race Vail had the pole, and after the field had got under way Resta came trailing around with plug trouble before he had crossed the tape and the field was again started.

It was a duel between Chevrolet and De Palma, the latter winning at the speed of 111 m.p.h. in the 20-mile. The four cars, Vail having retired with ignition trouble, were bunched most of the time, with the lead held principally by De Palma. Chevrolet, Resta and Mulford were serious contenders, but on the last lap the big Packard was shot over the tape with another record to its credit.

Under a threatening sky the four cars lined up for the 30-mile race, with Resta

at the pole. De Palma set such a terrific pace that Resta was forced to his pit, where diagnosis of his trouble indicated a burned out connecting rod bearing.

This left De Palma and Chevrolet sole contenders. So closely were they matched that when Starter Wagner finally waved the checkered flag De Palma crossed the tape but one second ahead of Chevrolet. Earlier in the race Mulford came to the pit with a plugged oil line.

Just before the race started De Palma's car got afire at the pits, but quick work put it out. There was no more damage than a scorched plug. Resta's car was considerably improved over its appearance in the Derby last June. Fouled plugs were his chief offenders. Mulford drove his first Sunday race, and although he kept well bunched with the leaders, his Frontenac did not possess quite enough speed to capture any of the events.

Vail showed up for the 50-mile race after having done considerable adjusting, and ran well with the field up to the time the race was flagged.

Officials of the speedway estimated from 15,000 to 18,000 people scattered about the paddock, grandstand and bleachers, and what the crowd lacked in numbers it made up in enthusiasm, for the spirited close time kept everyone on the alert. The previous 10-mile record on the Chicago track was held by Resta, and was 8 sec. more than De Palma's time made to-day. In setting the record for 20 miles, De Palma beat his own time, 10:53.08, made at Sheepshead Bay last August.

### Bearing Company Insures Employees

BOUND BROOK, N. J., July 30—The Bound Brook Oil-less Bearing Co. has insured all employees who have been in the service of the company for 3 months for \$500. This amount increases with the length of service. The expense of the policies is paid by the company, and the insurance plan applies to employees at the Bound Brook plant and the two factories at Lincoln, N. J.

### C. A. Lawton Building Addition

DE PERE, WIS., July 29—The C. A. Lawton Co., manufacturer of gasoline engines, is completing work on a 2-story addition, 40 x 120 ft., to be used for the forge shop, pattern-making department and machine shop. A new boiler room, 36 x 40 ft., is also being erected. The structures will be ready shortly after Aug. 1.

### Standard Foundry Changes Hands

RACINE, WIS., July 29—The Standard Foundry Co. has been purchased by a syndicate headed by Arthur Janes, from Henry and Albert Kousek, who established the plant in 1907. The foundry has been idle for several weeks because of a labor dispute, but will be reopened at once in order to fill Government contracts. The new officers of the company are: President, Arthur R. Janes; vice-president, David G. Janes, secretary and treasurer, E. L. Mrkvicka.

## G.M.C. to Take Over United Motors

Negotiations Reach Stage of  
Definite Plan for Exchange  
of Stock

NEW YORK, July 30—Negotiations having as their object the taking over of the United Motors Corp. by the General Motors Corp., the first inkling of which was given in the issue of AUTOMOTIVE INDUSTRIES for Feb. 28, have now reached the stage where a definite plan for the exchange of stock has been laid down, and it appears likely that the deal will be completed within a few days.

It is proposed now that General Motors acquire United Motors through the exchange of three-tenths of a share of General Motors preferred and one-tenth of a share of General Motors common for each share of United Motors. At the present time General Motors common is selling around 145, with the preferred at 82. On this basis, it would mean that United Motors stockholders would receive \$39 worth of General Motors stock for each share of United, which at present prices is worth about \$32.

Although no definite action has been taken as yet toward the ratification of this plan, it is regarded as likely that it will go through substantially as outlined. The United Motors Corp. has let it be known that it looks favorably upon the amalgamation, and it is known that General Motors has for several months been planning such a course of action.

The acquisition of United Motors by Durant interests appears entirely logical, inasmuch as it would give General Motors control of a big parts-making company. Chevrolet already owns 106,000 shares of United stock, and this will assist in the consolidation.

The United Motors Corp. was formed in May, 1916, and was an amalgamation of the following companies engaged in the manufacture of accessories, which are controlled by stock companies:

Perlman Rim Corp.	New York
Hyatt Roller Bearing Co.	Newark
New Departure Mfg. Co.	Bristol
Dayton Engineering Lab. Co.	Dayton
Remy Electric Co.	Anderson
Harrison Radiator Corp.	Lockport
Klaxon Co.	Newark

The manufacturing departments of these various companies remain separate, but close co-operation is effected in the sales and service departments. Gross sales of the constituent companies for the nine months ended March 31, 1917, were \$23,500,000, as compared with \$17,200,000 for the corresponding time in the previous year. The authorized and outstanding stock of the company consists of 1,200,000 shares (no par value) of common.

The officers of the company are: President, Alfred P. Sloan; vice-president, A. Deeds; secretary and treasurer, Witt Page; chairman of the finance committee, L. G. Kaufman.

**Government Survey of Housing Facilities**

WASHINGTON, July 30—The organization of a Homes Registration Service, for the utilization of available housing facilities in war industry zones, is being completed by the Department of Labor. The work will be performed in co-operation with the Council of National Defense, state and local defense bodies, and the U. S. Employment Service.

A survey is under way of the available houses, flats and rooms in each community. Lists will be compiled from the survey results, which will be distributed to the various offices of the U. S. Employment Service so that workers seeking jobs may at the same time be able to learn of available lodgings. In compiling the lists, such factors as effect of locality on nationality, types of houses and rooms, and classes and sex of workers are considered.

**Ford Production Decreased**

DETROIT, July 30—Production of the Ford Motor Co. after Aug. 1 will be 350 passenger cars and 400 trucks a day which is in accord with government wishes. It is estimated that at the close

of business July 31, when the fiscal year ends, the year's production will be, in round figures, 677,000 cars. The estimate is based upon the fact that during the first 10 months and 24 days of the 1918 fiscal year the output of cars was 651,191. Since then production has been steadily decreasing. With an average daily production of 1000 during June and 750 during July the remainder of the fiscal year would total about 25,750 cars. This, added to the above figures would aggregate 676,940 cars. How many Ford cars could have been easily disposed of can be estimated also from the fact that on June 10 the company had on its books unfilled orders calling for 89,242 touring cars, 9824 runabouts, 3013 coupes, 1675 sedans, 5234 trucks and 1619 chassis. Subsequent reports state the company being 110,000 cars behind.

**Service for Regal Cars at Old Plant**

DETROIT, July 27—Maurice Rothschild having purchased the complete equipment of the defunct Regal Motor Car Co., including all the property, goodwill, patterns, etc., will operate the property here.

**Canadian Makers to Ask for Steel**

TORONTO, ONT., July 29—The directors of the Automobile Manufacturers' Assn. of Canada met in Toronto this afternoon to discuss what action should be taken to request the Government to secure for the industry a sufficient supply of steel. Fear was expressed that the decision reached by the United States Government to reduce the supply of steel to certain industries, including that of the automobile, might have a serious effect on automobile manufacture in this country.

Gordon M. McGregor, general manager of the Ford works at Ford City, who attended the meeting, remarked the shutting down of the plant had been due to the difficulty of obtaining material, especially steel, and also to the fact that the Ford company wished to take a careful inventory of its true position at the present time.

Unless some action is taken by the Government, it is feared other plants will also have to suspend operations. The Government will be approached shortly, with a request to give the matter most careful consideration and early attention.

**A German Tank Captured by the French**

Several German tanks like the one here shown with the French crew which repaired it and used it against the Germans, have been captured in the recent fighting near the Marne. They are 33 feet long, overall, weigh 40 tons and are driven by two 4-cylinder Daimler engines of 100 horsepower each. Their speed on top gear is about 8 m.p.h. In general design they are simply creeper-type tractors armored with 1½ in. plates in front and ¾ in. plates elsewhere. The armor is said to be comparatively soft. The gun equipment comprises a piece, the equivalent of the British 6-pounder, which has a bore of approximately 2¼ in. and 8 heavy type machine guns. The crew of each tank is made up of 12 men.

## M. T. S. Divisions Defined

### New Organization Will Consist of Two Units Similar to Airplane Service

WASHINGTON, July 30—Further reorganization of the motor transport divisions of the Army in this country contemplates two divisions, similar to the airplane service, with one division purchasing and controlling production, and the other directing operation and training.

The purchasing, procurement and production will continue under the Motor Transport Service headed by Col. F. Glover. The operations and training is planned to come under a new separate army division to be known as the Motor Transport Corps and to be headed by Major Barrett Andrews, who, it is reported, will shortly be promoted to a colonelcy. Major Andrews has seen service for the past year with the American Expeditionary Forces under General Rogers, who controls the Motor Transport Corps of the A. E. F.

Further plans include division of the organization under Major Andrews into two sections, one headed by Lieut. Colonel W. D. Uhler and in charge of operations and convoys, the other to take charge of training. The chief of the training section has not yet been named, but this section will have the special attention of Major Andrews, who plans to inaugurate a system of training in this country that will give the personnel of the Motor Transport Corps experiences similar to those they will encounter in France.

Heretofore the operations section of the Motor Transport Service was combined with the maintenance and recently was under the direction of George Randles, who will remain in charge of maintenance.

Further standardization has been completed with the adoption of the Indian, Harley-Davidson and Solo motorcycles as the standard motorcycles in the general motor transport equipment. The Westfield bicycle has been taken as the standard bicycle.

The motorcycles will be known under type letters as follows:

Indian "I."  
Harley-Davidson "H."  
Solo "S."

Adoption of these motorcycles apparently marks the downfall of the original Liberty motorcycle which had been designed specially by motorcycle engineers for the U. S. Army and which was to have been the standard.

Type letters have also been announced to denote the passenger cars used in the army, as follows:

Ford "F."  
Dodge "D."  
Cadillac "C."

The Motor Transport Service is now giving attention to trailers and will

shortly announce the standardization and type names.

### Continued Scarcity of Common Labor

WASHINGTON, July 27—Reports for the week ended July 13 indicate a continued scarcity of common labor. Common labor conditions appear normal in Florida, Mississippi, Indiana, Michigan, Colorado and some sections of New England, but an acute shortage is reported throughout the balance of the nation, being especially serious in the Central and Southern States and in every Atlantic State from Connecticut to Georgia. Railroads and mines in the central states are losing their common labor because of the high wages offered in the harvest fields.

Shortage in the skilled trades division is also nation-wide and growing. There is hardly an industrial community where there are any unskilled workers, with the exception of automobile workers in factories. Machinists and boiler makers are in general demand. The greatest shortage for skilled workers lies along the Pacific and Atlantic coasts and in the states other than Indiana bordering on the Great Lakes. Out of 110 cities reporting skilled trade conditions, 26 show a shortage, 31 a surplus and 35 balanced conditions. The farm labor situation seems to be well in hand in the central wheat belt, but farm laborers are scarce in the East and in the Southern States.

A surplus of inexperienced women applying for clerical positions is noticeable. The demand for women in factory work is increasing and there is a great demand for their service in domestic and hotel work. Out of 133 cities reporting the female labor situation 42 show a shortage, 42 surplus and 49 normal conditions.

### Labor Situation Still Acute

WASHINGTON, July 26—A slight improvement in the common labor situation is indicated by a report for the week ended July 6, although the shortage is still nation wide and critical. One hundred and five cities reported shortage against 109 for the week previous. Cities with common labor surplus increased from 10 to 16, those with a balanced condition remain the same. There is a demand among employers of skilled labor for boiler makers, machinists, iron workers, lathe hands and tool makers. Mechanics other than machinists are needed in Connecticut, Delaware, Georgia and parts of Texas. There is a demand in the East for farm labor.

### Increased Demand for Women's Overalls

From every quarter comes evidence of the extent to which women are finding places in the industries of the country. According to reports from several manufacturers of them, women's overalls are selling in large quantities throughout the country. The largest markets are in the West and Middle West, but New England and the Eastern States are taking fairly large quantities. The chief call, say the makers, is for garments cut along lines which give ample freedom of movements.

## To Recruit Unskilled War Labor

### U. S. Employment Service Will Supply Workers to Many Manufacturers

WASHINGTON, July 29—On Aug. 1 the United States Employment Service will begin recruiting unskilled labor for employers engaged in war work who have filed orders for workers with the state directors of the service prior to July 30. The total demand, as shown by these orders, will be ascertained this week and divided among the states on a quota basis. State quotas will be announced Aug. 1. Orders received from employers after Aug. 1 will be compiled and quotas announced Aug. 15. Additional quotas will be made up on the same basis and announced from time to time as unskilled labor demands develop.

The prohibitions against private recruiting of unskilled labor by employers engaged in war work whose maximum force, including skilled and unskilled labor, exceeds 100, go into effect on Aug. 1.

In order that there may be no interruption in the labor supply of the more important war industries after Aug. 1 and before the program of the United States Employment Service for securing the men needed can be put into full operation, private field forces will be permitted to continue recruiting under regulations drawn up by the United States Employment Service which will provide, among other things, that labor thus secured shall be credited to the quota which is to be supplied by the community where such workers are obtained. No such recruiting may be done except with the permission of the State Director of the United States Employment Service where it is conducted. Full information concerning methods by which such private recruiting may be conducted can be secured from the Director General of the United States Employment Service at Washington.

### 25,000 Laborers Needed

WASHINGTON, July 27—The severe shortage of unskilled labor in war industries is indicated by the first 600 war plants to send in their requirements to the United States Employment Service asking for 25,000 common laborers now and 40,000 during August and September. The total of 25,000 men wanted now represents a direct shortage.

The Department of Labor expects to complete the State Advisory Boards of the United States Employment Service in the 28 states east of the Mississippi this week. These boards, which will administer the central labor recruiting program in each state, will act as court of appeal from decisions of the Community Labor Boards, and will be comprised of representatives of the states, employers, employees and the Government.

# Spruce and Fir Output Nears Requirements

Almost Enough Lumber Cut to Supply Allied Governments with Needed Material for Airplane Construction—350 Pieces of Spruce Used for Each Plane—11,000,000,000 Feet Standing

WASHINGTON, July 27—Production of spruce and fir for airplane construction is coming close to the requirements of this country and the Allies. The total spruce and fir shipped to June 15, including that delivered to the Allies, was: spruce, 52,000,000 feet; fir, 20,800,000 feet.

The frames of airplane wings, ailerons, fins, rudders, elevators, and stabilizers, the struts, landing gear, fuselage, flooring, engine bed, after-deck and seats are made of wood and preferably of spruce. This is because spruce is the toughest of soft woods for its weight, and possesses great shock absorbing qualities. Furthermore, it does not splinter when hit by a missile. Sitka spruce, white spruce and red spruce are used.

## Specifications for Parts

About 350 pieces of spruce are required in a single airplane, but not all of them are individually different; the wing beams are practically of similar dimensions, and the struts vary only in size according to the strains put upon them.

Roughly, the specifications for spruce parts are: Straight grain, clear from knots and defects so as to give maximum strength. The size of the rough pieces must be such as to insure a finished dimension after deducting losses for finishing, checking and shrinkage. Desirable pieces run from 1½ in. to 3 in. thick, 3 in. and upward in width, and from 5 ft. to 17 ft. in length. Practically all the available spruce is in the United States and along the western coast of British Columbia. In our country it grows close to the Pacific Coast on the western slopes of the Cascade range in the states of Washington and Oregon. The stand of Sitka spruce, which is the best airplane stock, in these two states is estimated at 11,000,000,000 feet. But less than half of it is near enough to transportation facilities or in dense enough stands to be commercialized. The total spruce shipped for the first three months of 1918 was over 20,000,000 feet, but the U. S. Government and the Allies required more than three times that quantity in that time, showing that we were not up to requirements in March.

## 11,000,000,000 Feet Standing

The vast total of eleven billion feet standing, however, is not all available for airplane construction, and never will be, because only a small per cent of the spruce is suitable for such use. It is stated that about 30 per cent of a good spruce log is available for airplane stock. At the outbreak of the war, very little spruce was being cut or shipped, and it remained for this country to supply the necessary amount.

On September 7, 1917, under the National

Defense Act, orders were placed in the name of the Secretary of War with the western spruce mills, which required them to give preference to Government orders. Col. Brice P. Disque, Signal Corps, was detailed to investigate the situation. He proceeded to Portland and reported to the Aircraft Board that the hostile attitude of labor and the shortage of labor in the vicinity had been responsible for the lack of production. The report was approved by the Aircraft Board and later, on November 6, 1917, Colonel Disque was placed in command of the Spruce Production Division of the Signal Corps, which had been organized a short time previously.

Colonel Disque organized a volunteer logging army of experienced men as part of the Signal Corps to supplement civilian labor in the logging camps, detaching them to camps producing Government aircraft lumber. All lumber-camp and mill conditions were supervised; food, housing and transportation of employees were regulated. A basic eight-hour day, with time and a half for overtime, was established at all camps, and a standard wage scale for each occupation was adopted for civilians and soldiers. There are now about 15,000 troops engaged in this work.

Colonel Disque was supplied with a fund of \$20,000,000 with which to aid responsible operators, who were in need of money, to the extent of 30 per cent of their contracts. In the end he quadrupled the output of spruce.

The felling of the trees and the transportation of the logs were not the only problems of production; the timber had to be cut up into airplane stock. The Government adopted a method employed in the woods, known as riving or splitting the logs longitudinally into cants. This made transportation easier and permitted the selection in the forest of the suitable stock which split straight and clear. Forty-nine saw-mills were available, but they did not operate well on Government contracts and had not the facilities required. Early in 1918 thirty-six of them closed, claiming a car shortage.

By erecting the largest saw mill in the world in 45 days, the Spruce Division made a distinct record. Work of erection was begun on December 24, 1917, and the mill was completed February 7, 1918. This huge cut-up mill is at Vancouver Barracks, Wash. It has twelve separate log carriages for conveying the spruce to twelve head saws, back of which are complete sets of edgers, cut-off saws and other machinery necessary to convert the rived or sawed cants into finished stock. This mill cost the Government in the neighborhood of \$200,000. There are 1,940 men in the second Provisional Regiment who operate this cut-up plant, working in three shifts of 8 hours each.

Before the war this sort of lumber was seasoned by air-drying, but the great demand for spruce necessitated a kiln-drying process. This was worked out by the Forest Products Laboratory, of the Forestry Service, and a plant costing \$350,000 was erected at Vancouver Barracks. A saving in shipping weight of 33½ per cent was effected by shipping dried wood to factories. Beam stock now requires twelve days and smaller parts about seven days for drying, a saving of considerable time as compared with the air-drying system.

When operations began in the neighbor-

hood of Vancouver Barracks there was a great scarcity of wire rope and other materials. Steps were immediately taken to secure control of the wire rope situation, sizes were standardized and distribution of wire rope was taken over by the Spruce Division, with the result that to date 6,000,000 feet of wire rope have been provided for the use of the loggers. After standardizing logging engines, the Logging Equipment Section secured 175 of these engines. Other equipment secured included 10 tons of wedge steel, innumerable jacks, steam engines, electric motors, saw-mill equipment and over 200 miles of rails.

Previous to the first week in February aircraft lumber shipments were handled individually.

Since February aircraft shipments have been consolidated with cars containing other Government lumber and handled in special through trains to Eastern points. The time of transit has been reduced by nearly 50 days. An average time of 15 days from the mill to Eastern factories is now being made.

It was first decided to use open freight cars for transporting this lumber, but on account of the character of the material it has been found necessary to ship aircraft lumber in closed cars. By thus protecting the lumber from the weather an increase in the number of cars required has resulted.

There is very little waste at the saw mills manufacturing airplane material, as all the stock unsuitable for aircraft requirements is still utilized as general commercial lumber. The percentage of split spruce logs now available is more than twice that before the war, due to the riving process. In July, 1917, new grading rules were established whereby the quantity of spruce necessary to be purchased for each plane was reduced practically a third.

Fir and Port Oxford cedar are used in aircraft manufacture when spruce is not available. The possibility of using laminated sections in the wooden construction of airplanes will tend to increase the amount of spruce available for this use.

A thorough canvass has been made of the entire spruce situation in the United States, detailed reports having been obtained from each section of the country. In the Northeast and New England States the Navy Department, in co-operation with the Bureau of Aircraft Production, is securing a maximum output of airplane spruce. In the South and Southeast a similar canvass has been made and plans are now under way for the production of spruce in this section.

## New England Spruce Lumber Prices Fixed

WASHINGTON, July 29—Prices for New England spruce lumber have been fixed by the Price Fixing Committee appointed by the President, after considering information submitted by the Federal Trade Commission on the cost of producing this lumber and information submitted by representatives thereof at hearings were considered. The prices have been set in agreement with the manufacturers and will be in effect from July 19 to November.

They will cover all purchases by the Allied governments, the railroads and other customers regularly purchasing lumber for mill shipment. The prices on all New England spruce lumber in the states of Maine, New Hampshire, Vermont and Massachusetts are not to exceed those given in the issued list. They

## To Cut Tire Production

(Continued from page 205)

of rubber consumed in pneumatic tires was about 65 per cent of the total; the present uses are now being ascertained through a questionnaire, the results of which will, we believe, show a decrease and that the increased consumption during the last three months has been due to essential uses.

A general working classification of the industry, in the order of approximate importance, is as follows (it always being assumed that Government orders take precedence):

- (a) Medical rubber goods.
- (b) Rubber footwear.
- (c) Waterproof clothing.
- (d) Solid tires and pneumatic tires for commercial use.
- (e) Mechanical rubber goods for the operation of industry.
- (f) Insulated wire.
- (g) Pneumatic tires for essential passenger use.
- (h) Bicycle tires.
- (i) Hard rubber goods other than medical.
- (j) Mechanical rubber goods for less essential use.
- (k) Rubber cement.
- (l) Pneumatic tires for pleasure use.

### The Problem and Suggestions for Meeting It

The problem which is confronting the Government and the rubber industry to-day is the conservation of crude material and the control of the consumption of the finished product, the end to have in mind being an assured supply of the products necessary for the war activities and sufficient importation of crude rubber to meet these requirements and to insure that they will be met in spite of any temporary interruption of ocean traffic. In this connection it must be borne in mind that it takes, on an average, about four months for rubber to come from the plantations to the manufacturer here, so the plans in connection with importation must be made far in advance.

The War Service Committee fully realizes the necessity for conserving shipping space across the Pacific (even though all of the rubber so imported in 1917 would occupy only 2.7 per cent of the total tonnage required for all imports) and for conserving manufacturing facilities and labor here and reducing the consumption of rubber to such an extent as may be consistent with the continued filling of the real needs of the war and of the public and preserving the national prosperity.

To this end the War Service Committee makes the following recommendations:

### 1. Recommendations as to Decreasing Production of Certain Articles

This committee believes that there should not, at the present time, be any restriction imposed as to the production of articles connected with athletics, which should be continued in order to develop and contribute to the public health.

Nor does the committee now make any recommendations as to those articles in which the uses of rubber are of an incidental character, forming only a small part of the article as a whole.

The War Industries Board might wish to consider eliminating the production of the following articles, or, pending the compilation of more detailed statistics, reducing their production during the two months of August and September, 1918, to such an extent as the War Industries Board thinks wise. This could be done under an order of the War Trade Board, a draft of which is presented as Exhibit E in the Pamphlet of Exhibits accompanying this memorandum, and would conserve rubber to some extent

## Letter of the War Industries Board Which Requests Cut in Tire Production

MY DEAR MR. WORK:

Your industry has operated during the months of May, June and July on the plan of allocation of crude rubber under a limited tonnage arrangement with the War Trade Board and, as additional information is necessary before finally determining upon the allocation for August, September and October (which information you are now compiling), it has been determined that for the months of August and September substantially the same arrangements and percentage of allocation will continue.

Your industry should understand that the need of conserving shipping space is as great, or perhaps greater than when this matter was first taken up last April. We understand that while approximately 25,000 tons were licensed for import during the months of May, June and July (although considerably more than this has been received), approximately 50,000 tons will have been consumed by the industry. It is obvious that something radical must be done at once to curtail the consumption of rubber and we feel sure we may rely upon the support of the industry in taking such immediate steps as may be necessary to conserve the present stocks of rubber now in the country and those due to arrive.

The Government departments are making every effort to determine requirements of crude rubber for essential war and business purposes, and as soon as this information is at hand steps will be taken to insure the import of sufficient rubber to meet those requirements.

As a means of conserving the stocks of crude rubber now in the country, your committee has suggested curtailment of the production of pneumatic automobile tires and tubes during the months of August and September, and we request you:

(a) To pledge the manufacturers of pneumatic tires and tubes to restrict the production in tonnage of rubber consumed and in numbers of casings and tubes to the extent of 50 per cent of the production for the corresponding months of August and September of last year. But in no event shall the manufacture of pneumatic casings and tubes during the month of August, 1918, or the month of September, 1918, exceed 50 per cent of the monthly average for the year 1917 both as to amount of rubber used and number of pieces produced. This restriction is exclusive of Government business.

(b) That you carefully consider restricting the manufacture of all other articles involving the use of rubber, as every possible saving should be made.

and conserve manufacturing facilities and labor to a greater extent:

Bathing Caps	Pitcher Mats
Mats and Matting	Poker Chips
(except for insulation purposes)	Umbrella Rings
Chair Tips	Toy Balloons
Tobacco Pouches	Flowers
Bath Mats	Bathing Garments
Bath Mitts	Advertising Specialties
Bath Pillows	Telephone Ear Pads
Beard Softeners	Cuspidors
Beauty Brushes	Goggles
Carriage Mats	Atomizers for Perfumery
Auto Mats	Bust Forms
Ching Mats	Camera Bulbs
Cuspidor Mats	Chin Bands
Door Mats	Cigar Holders
Drainboard Mats	Cigarette Holders
Flower Pot Mats	Complexion Bulbs
Rubber Toilet Sponges	Household Gloves
Toys	Tires for Horse Drawn Vehicles
Rubber Bands	
Glass Mats	

You are thoroughly familiar with the industry to which we look to patriotically and conscientiously cut out the consumption of crude rubber at every point where it can be done without injury to the nation's welfare.

A curtailment such as mentioned above, in the production of pneumatic tires and tubes and other articles, will not accomplish the desired result unless some plan is evolved for limiting and regulating the use of motor vehicles, and we expect the use of rubber tires will be restricted except for actual war and essential business purposes. We are not at liberty at this time to announce our plans for accomplishing this purpose, but will do so in the near future.

Every necessary step should be taken to discourage and prevent hoarding of the finished product by manufacturers, wholesalers, dealers and consumers, and we ask you—

(a) To evolve some plan, and put it into effect, which will accomplish this end, and to see to it that if any one of these factors are guilty of hoarding, that steps be taken to prevent their securing additional supplies.

(b) That advances in prices be prevented.

We look to you to see that this is accomplished.

Before arrangements are concluded for the importation of rubber after the month of September, with your co-operation we expect to evolve definite plans which will accomplish the purposes we are after, i.e., the conservation of every foot of shipping space possible by the conservation and restriction of the use of rubber.

We ask that you facilitate your final arrangements for co-operation with the Conservation Division in making such changes in the manufacture and distribution of your product as will result in the conservation of rubber during the period of the war.

We anticipate your complete co-operation in all of the above matters, and assure you of our desire to see that the industry is provided with the necessary raw materials to take care of the war and essential civilian needs as soon as they can be determined, and give you our further assurance that we desire to curtail the industry only in so far as it may become necessary to meet the war needs.

We understand that there will be a general meeting of the industry at an early date, at which time you will have an opportunity to lay all of these facts before the manufacturers.—Yours very truly, War Industries Board, by George N. Peek, Commissioner of Finished Products.

To Bertram G. Work, Chairman War Service Committee, care B. F. Goodrich Company, 1780 Broadway, New York City.

### 2. Recommendations as to Motor-Driven Vehicle Statistics

In order to obtain an accurate knowledge as to the classes of uses of motor-driven vehicles and the number employed in each class, the War Service Committee strongly urges that a Federal Licensing plan be at once put into effect along the lines set forth in detail in Exhibit F contained in the Pamphlet of Exhibits accompanying this memorandum. This is believed to be the only practical way of obtaining the information which should be had and of enforcing any regulations that may be adopted toward controlling the uses of motor-driven vehicles.

### 3. Recommendations as to Reducing Pneumatic Tire Production

As some time would necessarily elapse before the information could be compiled

through the Federal licensing plan; above suggested, this Committee recommends, to prevent the disastrous condition, which seems to be imminent, that immediate measures be taken to reduce the consumption of rubber in pneumatic tires suitable for pleasure vehicles, by requiring each manufacturer to reduce its production of pneumatic casings (and tubes therefor) of sizes up to 6 in. (6 in. and over being used entirely on trucks) and reduce its consumption of rubber in such casings and tubes to one-twelfth of its 1917 production and consumption—always excluding Government orders.

This may be done through an order to be issued by the War Trade Board, along the lines of Exhibit E, requiring each manufacturer to limit its consumption in August and September to one-twelfth of the total amount of crude rubber used by it during 1917 in the specified casings and tubes, and also requiring it to limit its production of those articles to one-twelfth of the total number of such articles produced by it during 1917.

It is obvious that the unnecessary use of motor-driven vehicles cannot equitably be controlled by a restriction in the importation of crude rubber; it can be limited by controlling the use made of the imported rubber, but that would not meet the situation existing because of the stocks in the hands of many users. It can completely and fairly be controlled only by regulation of the use of the vehicles themselves, based upon a licensing plan somewhat along the lines above proposed. The vehicles themselves should be controlled rather than any one element of them.

#### 4. Recommendations as to Notice of Restrictions

This Committee desires to point out that the restriction of production of pneumatic casings and tubes for limited periods will induce unwarranted buying and hoarding before the restrictions become effective unless notice of restriction is accompanied by an announcement of the proposed possible restriction of use under Federal control of license. The Committee strongly recommends that such announcement be made at the time when notice of restriction is given.

#### 5. Recommendation as to Importation

The increase in the demand for rubber articles, due to war activities and industries connected therewith, is such that the 100,000 tons which are now permitted to be imported are inadequate even on a very conservative estimate, as is shown in detail in Exhibit G forming a part of the Pamphlet of Exhibits presented with this memorandum. We recommend a tentative importation at the rate of 160,000 tons, as stated in Exhibit G.

These figures show the necessity of increasing the shipping of rubber to this country, to avoid serious consequences, even though the excess amount of rubber shipped here be held in this country for allocation at a later date. Any plans for such increase should be made now, as the time required for delivery from the source to the manufacturer is practically four months, and it would be far better to have an excess of rubber come in during the fall months, when advantage could be taken of shipping facilities and when transportation from the Coast to the manufacturer is much more prompt than in the winter months when everything possible should be done to lessen the congestion of traffic.

#### 6. Recommendation as to Principle Which Should Be Adopted

This Committee believes that the only safe and logical course to follow is to restrict the uses of crude rubber to any point that may be found necessary, no matter how drastic

such restriction may ultimately be, and provide for the importation of sufficient crude rubber surely to meet this requirement, which involves the accumulation of stocks adequate to tide over any temporary failure of transportation facilities.

The existing plan appears to be to permit importation to an amount based upon estimates of what should be required, but as the uses of the rubber are not controlled, the stocks are being dissipated and the country is approaching the danger point, as no provision has as yet been made for replenishing stocks and for insuring the use along essential lines in the future.

This committee, knowing that the rubber industry desires to work wholeheartedly to carry out any regulations put into effect by the governmental departments, and that it will do so particularly if all of the circumstances are fully explained and known, requests that, in the interest of the most complete understanding and co-operation, this committee be given an opportunity to call together and to explain to the whole industry whatever regulations may be decided upon, and to do this before those regulations have otherwise been announced. A complete understanding will furnish a basis for directing the efforts of the rubber industry most effectively along the lines of the needs of the Government and of the public as a whole.

In making the above presentation of facts and recommendations, the War Service Committee of the rubber industry has endeavored to place the War Industries Board in a position to view the situation in its true light, in order that the Government may fairly meet the responsibility which necessarily rests upon it in dealing with this industry. The responsibility of this committee has been met when it has presented the facts and its recommendations.

The War Service Committee of the rubber industry is ready, at any time, to meet the War Industries Board and other governmental departments to answer any questions that may be asked and further to discuss any suggestions that may be made. —Respectfully submitted, B. G. Work, chairman; H. S. Firestone, J. N. Gunn, G. B. Hodgman, P. W. Litchfield, H. T. Dunn, C. T. Wilson.

#### Exhibit B

A greater part of the crude rubber imported is of the plantation character, coming from British and Dutch possessions in the Far East. Roughly speaking, 70 per cent from British territory and 30 per cent from Dutch. It is mainly shipped to Pacific ports.

The following table is submitted:

Total tonnage in the Pacific in units of cargo tons of 100 cu. ft. during 1917 .....	2,333,140 tons
Total weight of crude rubber imported during 1917 at Pacific ports.....	113,846 long tons
Or in cargo tons of 100 cu. ft. ....	85,005 tons
Or 3.6 per cent of the total tonnage.	
Value of imports at the Pacific Coast during 1917.....	\$539,335,640
Value of crude rubber imports..	150,151,590
Reduced to percentages 3.6 per cent of the total Pacific tonnage was used in bringing in 28 per cent of the value of the importations at the Pacific Coast.	

Ordinarily Plantation rubber will average about 30 lb. to the cubic foot in packing. Due to the successful experiments on the part of a large manufacturer we have demonstrated that rubber can be packed under pressure and baled with a space economy of somewhat over 25 per cent.

The manufacturer placed at the disposal of the industry the result of his experiments, and they were quickly acted upon. A large number of presses were sent out, others were built locally, and rubber is reaching America packed on the average of 35 to 40 lb. per cubic foot.

On the basis of the same importations and the same amount of tonnage, under the new method of packing 2.7 per cent of the total Pacific shipping space will be used.

#### Exhibit C

Summary of 448 replies out of 503 questionnaires—Sent out March 5, 1918.

Amount of crude rubber used in the production of specified classes of goods.

	Tons used during calendar year ending Dec. 31, 1917
<b>Tires and Tubes—Class</b>	
Automobile pneumatic casings...	71,664
Automobile pneumatic tubes....	14,422
Motor and bicycle tires and tire sundries .....	2,815
Solid tires .....	11,685
Casings and tubes combined....	8,782
Casings, tires and tubes combined .....	902
Mechanical rubber goods.....	21,323
Boots and shoes .....	12,638
Insulated wire and insulating compounds .....	2,756
Druggists' and stationers' sundries and surgical rubber goods.....	3,732
Waterproof clothing, including carriage cloth and rubber sheeting	1,590
Waterproof cloth, including single and double texture .....	585
Hard rubber goods.....	1,165
Rubber cement .....	1,462
Miscellaneous, not included in any of the above schedules.....	1,798

#### Exhibit E

Draft of suggested notice to be sent to manufacturers by the War Trade Board, curtailing the production of certain articles.

In accordance with the second paragraph of clause 5 of the guaranty given us, under which deliveries of crude rubber are made to you, specifying that all sales of manufactured or partly manufactured goods be subject to the control and regulation of the War Trade Board and to comply with any rules or regulations concerning such sales providing methods, restrictions and limitations under which such sales may be made, you are advised as follows:

Under date of Aug. 1, and effective for two months thereafter, the manufacturer of pneumatic casings and tubes therefor shall not consume for the two months more than one-twelfth of his total amount consumed in each class of said articles during 1917, neither shall the number of pieces exceed one-twelfth of his output during 1917.

(Add here such restrictions on production of the articles listed in Recommendation No. 1 of our memorandum, as may be decided upon by the War Industries Board.)

#### Exhibit F

##### Federal Licenses for Motor Vehicles

It is suggested that the Government shall immediately require all motor (including motorcycles) vehicles to display thereon in conjunction with the regular state or city license plate a Federal license tag or plate.

The plan as outlined hereinafter contemplates the use, exclusively, of the existing state or city license boards and no staff of clerks would be required to be employed by any Federal department or by the War Industries Board.

It may possibly require in Washington the detailing to some one person with four clerks and stenographers, to conduct the correspondence with the highway commissioners or secretaries of state or other heads of licensing boards during the short period incidental to making clear to them the contemplated plan, but it is believed that the whole matter will involve but little work on the part of the Government other than that indicated.

The plan could be made immediately effective by first calling in conference the heads of the licensing boards of Massachusetts, New York, Connecticut, New Jersey, District of Columbia, Maryland and Illinois, placing on them the responsibility of formulating plans for immediate procedure. No delay should ensue, as there is at present close co-operation between all of the existing licensing boards, and it would not add to the expense of administration of these boards to any extent that would not be compensated by the charge of the proposed fees of \$2 per vehicle, which sum, if it is considered too large, could safely be reduced to \$1.

If the Federal Government does not care to take the formal initiative in this, a conference should be called in Washington of the heads of the licensing boards above referred to: they will then make plans to take the suggestion of the War Industries Board and make the plan effective on their own initiative.

The Federal license tag shall bear a letter indicating the character of the use of the vehicle.

For further identification, each tag shall be of a different color selected for each of the several classes.

It is recommended that the existing license board of each of the states (or in some few cases—cities) shall be utilized for the issuing and registration of the Federal licenses.

Each license board shall charge the owner of the vehicle, in payment for registration and tags, the sum of \$2 (or \$1) for each set of license tags for each vehicle.

Written applications for Federal licenses shall be filed with each license board.

The license board shall issue to the owner of the vehicle a Federal license and receipt for registration fee with the tags or plates.

It may be required that the applicant for the license shall state under oath the use made of each of the vehicles licensed.

Federal license tags shall be issued as follows for each of the classes of vehicles described after the corresponding letters:

- A (Green) Trucks or motor vehicles with solid rubber tires (except electric passenger cars).
- B (Blue) Trucks or motor vehicles (commercial bodies) using pneumatic tires or pneumatic and solid tires, for the conveyance of materials or merchandise.
- C (White) Motor vehicles (passenger) running for hire, including taxis, jitneys and busses.
- D (Red) Motor vehicles (passenger bodies) used by physicians and surgeons in professional work, hospitals, institutions, mercantile and manufacturing owners or companies or persons using vehicles in the conduct of their business.
- E (Brown) Motor vehicles (passenger or commercial bodies) used by farmers or owners in rural communities using their cars for passenger or merchandise transportation in connection with their work and living.
- F (Yellow) Privately owned passenger vehicles used for recreation, convenience or pleasure, whether driven by the owner or by paid chauffeur or driver.
- G (Black) All motor vehicles (passenger and commercial) in the service of Federal, State or Municipal Departments or Employees, or owned or used by Government Controlled Railroads or Government Controlled Express Companies.

The issuing of such licenses under the request or direction of the War Industries Board by the utilization of existing licensing

facilities of the various States or Cities—

- (a) Will afford accurate means of determining the number of vehicles in each class in any and all states and cities or communities;
- (b) Will provide a means for the regulation of the use of all vehicles;
- (c) Will provide means for the exclusion or limitation of the use of all vehicles in any class;
- (d) Will provide means, if and when it may be deemed necessary for the control of the consumption or distribution of fuel and oil;
- (e) And in case of Class F, will afford means for the restriction of the use of such vehicles unless driven by the owner (unless under special license).

The foregoing plan is submitted in the belief that it is essential to secure accurate information regarding the use of all cars before attempting to promulgate any rules for regulation or limitation, or even for specific direct Federal taxation or control of supply of fuel.

The plan insures securing this vital information promptly, as it is believed that all cars may be registered and provided with license plates within thirty days after such plates and the necessary application and receipt forms are supplied to each of the local license bodies.

It is further suggested that the license plates and tags first used shall, with the distinguishing letter and color, bear the year date, 1918, and that provision be made for stamping on a small space provided on the tag the corresponding State or City license number to provide against fraudulent use of Federal identification tags or plates.

#### Exhibit G

The consumption during the quarter ending June 30, 1918, was 52,000 tons. During that quarter there was no restriction in force regarding the use or consumption, so it may be stated that normal requirements for 1918 would be at least 200,000 tons as compared with about 160,000 tons during 1917.

The Government is working on a basis of allowing importation of 100,000 tons, or 220,000,000 lb.

Consumption 1917 for the U. S. was about 157,360 tons, or 352,000,000 lb.

We feel 220,000,000 lb. insufficient, even granting:

- A. Restriction of automobiles within reasonable limits.
- B. Elimination of all non-essentials.
- C. Whatever may be accomplished through the matter of standardization and simplification of varieties and kinds of the whole industry.

For example:

Total rubber consumption	
U. S., 1917.....	352,000,000 lbs.
Total rubber consumption tire industry U. S., 1917.....	247,000,000 lbs.
Total rubber consumed in solid tires in U. S., 1917—less...	26,000,000 lbs.
Total rubber consumed in pneumatic tires U. S., 1917.	221,000,000 lbs.
One-half of rubber consumed in pneumatic tires, 1917...	110,500,000 lbs.
To provide for solid tires and 6 in. and over pneumatic tires for trucks and Government purposes—present requirements for solid tires being three times the requirements of 1917, irrespective of increased demand for pneumatic truck tires of 6 in. and over—add.....	100,000,000 lbs.
Consumption of rubber for all other purposes 1917, all articles other than tires...	105,000,000 lbs.
Requirements as against.....	315,500,000 lbs.
Estimated by the Government .....	220,000,000 lbs.
Difference, or .....	95,500,000 lbs.

43,409 tons

We consider this example, which would require 143,409 tons to be imported as against the 100,000 tons estimated by the Government, to be ultra-conservative, for the following reasons:

- A. January 1, 1917, there were licensed, 3,400,000 automobiles.
- January 1, 1918, there were licensed, 5,200,000 automobiles.
- An increase of cars during 1917 of 1,800,000, or 53 per cent.
- Granting no automobiles produced in 1918, the nominal requirements for tires and consequent consumption of crude rubber would be greater in 1918 than 1917, and when we assume in the foregoing example the reduction of pneumatic tires and tubes by 50 per cent (for the purpose of illustration), we feel we are going further than the Government will eventually feel it wise to go in the reduction of tires for use on automobiles for essential purposes.
- B. The allowance of 100,000,000 lbs. for truck tires for the coming 12 months will probably be about right, based on the present demand for truck tires.
- C. We believe that the 105,000,000 lbs. provided for the manufacture of all other rubber goods, which is the amount consumed in 1917, is far too small, since:
  - (a) The speeding up of many of the industries for war purposes is calling for increased tonnage of mechanical goods.
  - (b) The demand for hospital supplies and electrical insulation is greatly in excess of a year ago.
  - (c) Sixty per cent of the total capacity of the country for certain heavy grades of rubber footwear is being taken by the Government, these being the grades that use the largest percentage of rubber in the footwear division.

We fear the Government expects a reduction in poundage consumption of crude, due to the work being done by the Conservation Division of the Government, with which the industry is working in close co-operation. For the next 6 months or year, while much will be accomplished in co-operation with the Conservation Division, which may mean more economy in labor, space, etc., we do not believe it will result in a reduction of poundage consumption of crude rubber.

For example:

- 1. If styles and kinds of hospital supplies were cut in two, it would not result in saving half the poundage of rubber, but only in doubling the amount of rubber consumed in the remaining styles and kinds. This would also be true as regards mechanical goods, footwear, etc.
- 2. Many styles and kinds will be eliminated altogether, and these in number may more than equal those retained, but those eliminated for the sake of economy and efficiency of operation would be styles and kinds of limited production in normal times, and consequently small tonnage of rubber consumed, which in our opinion would be for some time to come offset by the increased demand for the styles and kinds retained.

The total amount of tonnage involved in the proposed restrictions for August and September is small, with the exception of the curtailment of tire production. Figures are now being prepared to show the amount of rubber used in each class of articles during the last quarter, and these will be submitted to the War Industries Board as soon as they are available.

From the facts and figures already at hand, it is obvious that 100,000 tons is inadequate and that a minimum of 160,000 tons will be required under the most rigid restrictions of consumption.

We would, therefore, recommend that 160,000 tons per annum be taken as the tentative minimum, and that allocation for August and September be made upon this basis. Before a further allocation is necessary, the Board will have actual figures upon which to form a definite conclusion.

#### 40,000 See Tractor Demonstration

(Continued from page 204)

the tractor field in the future than he has in the past.

There are some tractors much in need of the professional engineer, and though the engineer is not the be-all and end-all of the tractor design, it is imperative that his work be incorporated in it.

He is of the opinion that tractors in too many cases are rated too high. Too often the ratings represent the maximum capacity of the machine, which means that they have not enough reserve power. This is a mistake. The farmer is deceived by these over ratings.

Professor Davidson made a plea for a standard method of tractor rating. He was certain that it is coming, and no obstruction should be placed in its path.

He gave a few valuable words of advice to tractor salesmen. The tractor cannot be sold on price alone. It cannot be sold on horsepower alone. The necessity in every tractor is sound engineering that will give reliability and performance. Incidentally he told of how California is one of the greatest tractor states. It has very rough land, as well as a wide variety of soils, some light and others very heavy. The State has been a pioneer in the tractor field, and the farmers in California are not looking for the cheapest tractor but for the one that will give best results in the long run.

J. B. Bartholomew told of how the Salina demonstrations are the best that have ever been held. No better place in the country could be selected, as the tractors are plowing very hard soil in weather that is too hot for horses to work to advantage.

This year Kansas will produce 100,000,000 bushels of winter wheat, or one-ninth of all the winter wheat in the country.

E. J. Gittins of the Case company, and a member of the tractor committee handling the demonstrations, spoke very favorably of standardization and declared that gradually different tractors are coming closer and closer together to the eventual goal. While many may declare that many improvements have not been made during the past year, Mr. Gittins believes that very great progress has been made, not in a few but in a very large percentage of the machines.

#### Hardman Tire Reorganized

BELLEVILLE, N. J., July 31—The Hardman Tire & Rubber Corp. was reorganized on July 1, and the business will be continued under the style Hardman Rubber Corp. The present plant will be operated, and in addition a new plant will be built shortly. The present production is 125 tires a day, but the addition will increase this to 450.

The new officers are: President, Lorne A. Scott; vice-president and manager of production, Albert A. Pashek; treasurer, Walter Haefeli; secretary, Arthur C. Bang. Clayton C. Dobbs has been named sales manager and John D. Reynolds manager of sales for the southern territory, with headquarters in Baltimore.

The tire has been placed on the 5000-mile adjustable basis and will operate on the standard guarantee. Direct sales have been discontinued, and tires will be distributed by dealers.

#### N. A. D. A. Members Rolling In

ST. LOUIS, July 30—If the present rate of speed is maintained the National Automobile Dealers' Association will have its wanted 5000 members by September. There are about 3000 in now. At a big meeting in Boston last week Friday there ended a two weeks' campaign that brought the New England total to 445 and more are coming.

Last Wednesday in Newark, N. J., the New Jersey dealers endorsed the project, as did the Buffalo dealers the evening before. A big meeting is scheduled for Chicago to-night.

President F. W. A. Vesper and Executive Secretary E. E. Peake are traveling rapidly in their speech-making tours from city to city.

#### Paige Price Increased

DETROIT, July 31—The Paige-Detroit Motor Car Co. will increase the prices of its cars on Aug. 1, as follows:

Model	Old Price	New Price	Increase
6-39 .....	\$1,395	\$1,515	\$120
Essex, 6-55 .....	1,830	1,985	155
Larchmont, 6-55 .....	1,950	2,090	140

#### Goodrich Purchases Resort for Employees

AKRON, July 30—The B. F. Goodrich Rubber Co. has purchased a large tract of land near the city, including Rex Lake, for a recreation center in addition to the athletic field maintained by the company. A large summer cottage has been erected on the grounds where employees may spend week-ends and their vacations. A bathing pier and beaches have been provided; also boats for fishing, basketball and tennis courts. Free transportation between Akron and the lake, a distance of 9 miles, is arranged for.

#### Develop New "Liberty Aero Oil"

WASHINGTON, July 31—Development of a new aircraft engine oil to be known as the "Liberty Aero Oil," to be used in the Liberty engine and all stationary cylinder aircraft engines, by the Army and Navy, was announced to-day by the Department of Military Aeronautics. The new oil is a mineral oil, the result of experiments lasting 12 months, carried on by a staff of men who worked uninterruptedly on the problem. One officer worked so intensively that he became ill and died. This was Captain O. J. May. Captain May personally supervised the running of 37 engine tests in 25 days in a laboratory where 5 engine tests a week would ordinarily be a complete program. To determine lubrication and fuel at high levels Captain May

went to the altitude testing laboratories, an airtight building capable of having the air within it partly reduced and kept constant by means of exhaust air pumps.

It is stated that the new oil will be available in quantities sufficient to meet our airplane needs and that it will cost about 75 cents per gal.

Plans have also been completed and placed in operation for the reclamation of used oil, and at least 50 per cent can be used again under the scheme devised.

It is estimated that our airplane program will call for at least 5,000,000 gal. of lubricating oil and that since castor oil costs \$3 per gal. Captain May's experiments will save the Government at least \$11,000,000.

#### Michigan Plants Listed for War Work

DETROIT, July 30—Samples of the questionnaires to be sent out to all Michigan manufacturers by the Survey and Conversion Section of the War Industries Board in an effort to determine the possibility of converting their plants to war work have been made. At the meeting of the heads of the thirteen districts of Michigan plans were formulated for each district head to get in touch with every manufacturer in his district. Sub-chairmen for each industry within the district will be appointed by the district heads.

The war resources committee will act as a go-between in supplying Washington with plants that can do war work and that the government will get in touch with such plants as they are needed. The district representatives were told at the meeting to discourage building of all kinds of industrial work but to use buildings that were already standing or converted for war work.

#### Only One More Show for Canada

TORONTO, ONT., July 29—Other than the National Automobile Show of Canada, held in conjunction with the Canadian National Exhibition in Toronto, there will be no more automobile shows in Canada until after the war. This decision was reached at the board meeting of the recently organized Automotive Industries of Canada, and announced by its president, G. M. McGregor, of the Ford Motor Co. of Canada. The organization includes in its membership all Canadian car manufacturers (Briscoe, Chalmers, Chevrolet, Ford, Gray-Dort, Maxwell, McLaughlin, Studebaker and Willys-Overland), as well as many tire, parts and accessory manufacturers.

#### Plan Kansas City Tractor Show

KANSAS, MO., July 29—The fourth annual Kansas City Tractor Show will be held Feb. 10 to 15, 1919, in a special building to be erected on the plaza facing the Union Depot. The building will be approximately double the size of the one used last February. The tractor manufacturers have already practically signed up for space double the area used at the last show. The show, as formerly, will be conducted by the Kansas City Tractor Club, with Guy H. Hall as secretary and manager.

## Castor Bean Industry Being Revived

108,000 Acres in Southern States and California—Growers Expect a Supply of 2,000,000 Gallons of Oil the First Year—Oil Essential for Rotary Motors

delivery at Boston but do not incur tax on freight bills. The usual practice, including 1 per cent cash in 15 days or 30 days net, is to be. The War Industries Board gave priority on all available supply and will allocate supplies to Government departments and other essential departments as required. Any balance not used will be released for sale to retail buyers, but at prices no higher than determined upon. Foreign supply except to Allied Governments, is controlled by the ruling.

Prices set for rough lumber range from 8 to \$60 for specified lengths of 10 to 20 ft. and from \$36.50 to \$59 for planing one side. For planing one side and two sides, \$1; for planing two sides and matching or grooving, \$1.50; for planing four sides, \$1.50.

### Standard and Maxwell Dealers Retain Lines

ST. LOUIS, July 25—Contrary to reports, the Standard Motor Sales Corp. is maintaining a general practice of combining Standard and Chalmers agencies. In instances the company has found it better to combine the field forces of the two lines and it has become a general opinion that the company has been successful all over the country. This has been decided by the company. A statement has been made that the dealers are not disturbed and that each agency is maintaining its respective line as heretofore.

### Online Profiteering in Bay State

BOSTON, July 27—There will be no increase in gasoline in Massachusetts as a result of the increase of 1/2 cent permitted by the United States War Relocation Authority. Fuel Administrator James M. Cowley, who has direct charge of all matters throughout the State, reported that some of the retailers had raised the price a few cents following the increase by the oil companies. Thereupon he issued a statement requesting persons who come across retailers to have advanced the price more than a cent to notify him at once, and stop the practice.

Under the powers granted him by the War Relocation Authority, Fuel Administrator Storow may revoke the license of any such dealer to do business in Massachusetts, either for a few weeks or for the period of the war. Examples have been made of other profiteers in sugar, flour, etc., and gasoline profiteers will meet the same fate.

### Continue Price-Fixing for Scrap Steel

WASHINGTON, July 27—The Price Fixing Committee of the War Industries Board announces that rumors circulated in publishing companies that price-fixing for scrap steel would be discontinued are untrue. It states that conservation of scrap steel and stimulation of the steel industry are matters of first importance in the emergency.

WASHINGTON, July 27—The planting of 108,000 acres with castor oil beans in 8 Southern States and California, Cuba, Haiti and Santo Domingo is proving successful, according to a statement from the Bureau of Aircraft Production. The supply of oil from this territory will be available this fall, some of it as early as August. It is estimated that the average acre will produce 20 gallons of oil of No. 1 grade, making 2,000,000 gallons for the first year.

The necessity of obtaining millions of gallons of castor oil for lubricating rotary aviation engines during the first two years of the war, when the available supply was only 700,000 gallons, was one of the several anticipated problems encountered in 1917 in the operation of the American air problems. In its solution—namely, the growing of castor oil beans in the above mentioned states and countries—the industry has been revived. Although castor beans are not native to this country it is believed that they will grow readily in the South. They can be grown between rows of citrus trees and also on land previously ruined for cotton growing by the boll weevil. The Government will let contracts for crushing the picked crops.

Briefly, the process of manufacturing castor oil entails the cold pressing of the beans for the extraction of the oil suitable for aviation engines and medicinal purposes. This oil is purified by a filtration process and is then ready for use. The residue of the first pressing is treated and an additional supply of inferior oil is obtainable. This is known as No. 3 grade. After the extraction of the inferior oil, castor pomace remains, which, when ground, makes a valuable fertilizer.

Before the war, the demand for castor oil for airplane engines, American medicinal and industrial needs called for about 2,500,000 gallons per year. Commercially it was used in the manufacture of soaps, inks, dyes, artificial leather and fly paper.

### Co-operation Helpful

The results of this work, now well under way, are due in great extent to the co-operation between the Department of Agriculture, the War Trade Board, and the Materials Department of the Bureau of Aircraft Production, with foreign advice and assistance.

India has long been the world's leading source of supply for castor beans. Of the total imports into this country before the war, 80 per cent came from India. The American industry, which originally flourished in Oklahoma, Kansas, Missouri and Illinois, succumbed some years ago to the cheaper importations from India and could contribute but little to the demands of the air service.

In September, 1917, the castor oil situation assumed such a serious aspect that the Signal Corps, through the Secretary of War, secured the appointment of a board to deal with the difficulty. This body comprised representatives of the Aviation Section of the Signal Corps, Department of Agriculture, Export Bureau of War Trade Board and civilian experts. Deliberations of the Castor Oil Production Board resulted in the planting of castor beans in more than 100,000 acres in and near this country under Government contracts. The price recommended to be paid for beans so grown was \$3.50 per 46 lb. bushel.

Seeds Brought from India

Arrangements made with Great Britain for the seed supply resulted in releasing the steamship *Adelaid*, then being held at Bombay, although already consigned to this country. On January 7, 1918, this ship arrived with about 6000 long tons of castor beans. Approximately 200 tons were used as seed and the remainder pressed for oil by the original contractors, for immediate Government needs. This supplied about 500,000 gallons. More than a million gallons of oil were obtained from England for shipment direct to France. These supplies, together with oil from other sources, made a total of 2,400,000 gallons available.

### Seeds Brought from India

Although castor oil is not essential as a lubricant for the Liberty engine, or most of the other reciprocating engines, it is essential to the efficient operation of rotary motors. In this type the gas is taken in through the crankcase where it comes in contact with the oil, but, as castor oil is only slightly soluble in gasoline, it is practically unaffected. Other important properties of this lubricant are its heavy viscosity and high lubricating value.

Although little has been said regarding the rotary motors in the air program, great numbers are now in use abroad and many more are in course of manufacture. The Air Service is using engines of this type in advanced training planes. One hundred and fifty of them have been finished and are now in use. Some 500 planes, now being manufactured, will take rotary motors, as will a new single seater, pursuit type plane for advanced training. The need of castor oil as a lubricant, therefore, has become a feature of the air program and the lack of it a serious handicap.

Oakland Employees to Have Holiday

PONTIAC, MICH., July 27—Thursday, Aug. 22, will be a holiday for employees of the Oakland Motor Car Co. On that date the company will entertain its workers with a picnic at Lake Orion.

# Industrial Review of the Week

## A Summary of Major Developments in Other Fields

### Steel Makers to Increase the Allotment for Shipyards

A conference in New York Monday between Government leaders in ship-building, the Director of Steel Supply and the steel manufacturers' committee had to do with means of increasing the allotment of steel to shipyards, in view of the enlarging program for the Schwab drive. At a meeting in Washington later in the week plans will be made to insure shipyard work against interruption in the coming year, also for the prevention of lost motion through competing efforts of Washington departments, the commanding general in France and the Allies.

The whole tenor of the conference talk was that however detailed figures might be changed, the main fact was the increasing war demand for steel and with it an indefinite but inevitable reduction in the amount available for other uses.

The large schedules of steel for direct and indirect war needs give weight to the claim still widely made that all Governmental agencies concerned have put their requirements at top figures, in spite of repeated requests for pruning. In short, if deliveries meet schedule figures, it is believed the reservoir would be an ever filling one, unless the talked-of-railroad breakdown should be really serious. The half-year's demand for shell steel has risen to 3,000,000 tons, requiring a shipment rate probably 15 per cent above that now obtaining, and the plate total is close to theoretical capacity and about 12 per cent more than the recent record outputs.

Washington has come to the help of the jobbers, many of whom were left with small stocks owing to poor deliveries in recent months. For August the Director of Steel Supply permits them to receive from the mills shipments equal to their average in the first six months of the year. Beginning with September, however, the War Industries Board's plan becomes effective, permitting the replacement each month of the amount shipped by the jobber from stock for Government and essential purposes in the preceding month.—*Iron Age*.

### Fifty Tractors in National Demonstration at Salina

(Continued from page 178)

said were impossible. They declared that it was impossible to do good plowing at speeds of 3.5 and perhaps 4 m.p.h., but to-day they saw some of the best plowing being done at those speeds. The redesigning of the plows has made this possible. To-day we saw a 10-foot Moline mower which makes it possible to cut 25 acres of hay in a single day and

also makes it possible to use a tractor efficiently with such a machine. The old 6-ft. machines were really too small for the tractor. To-day self-binders for cutting grains are being designed to withstand tractor speeds. They are better made and heavier. They must travel faster.

The tractor and the shortage of farm help demand it. So it is all along the line of farm machinery, and so already we see the entering of the wedge of an era of redesigning in farm machinery, changing it from the horse pace that it has followed for generations and placing it on the tractor pace standard.

### Scripps Price Advanced

DETROIT, July 31—The Scripps-Booth Corp. will advance the prices of its cars on Aug. 1 as follows:

Model	Old Price	New Price	Increase
6-cylinder, touring...	\$1,195	\$1,385	\$190
4-cylinder, touring...	985	1,065	180

The price of the 8-cylinder model remains the same. New 6-cylinder coupe and sedan models, to be known as Model 42 and Model 41, respectively, will be sold for \$1,985. The company will bring out shortly a new Model K semi-coupe with a winter top. The sample has already been finished and production will begin immediately. No price has been announced yet.

The company manufactured 750 cars during July.

### Used Car Sales Brisk in Detroit

DETROIT, July 29—Brisk sales of used cars are reported from Detroit territory. Only a few dealers say that business is not as good as it should be. Practically all dealers estimate their July business to be from 25 to 33 1/3 per cent better than June, and nearly all show marked increases over last year's business.

The Simonds Sales Co. reports that it sold during the first 27 days of July 95 used cars and 99 new ones, forty-nine being "trade-ins."

The future of the used-car business is exemplified in the action of the Thomas J. Doyle Co., distributor of Dodge Brothers cars. The company is about to establish another company to have the same name, which will be a new organization formed to buy and sell used cars. No cars will be accepted on consignment; all cars will be bought outright for cash and sold on easy terms.

Three men have been sent out on the road to cover the entire country in search of used cars. A large store at 734 Woodward Avenue has been leased and all lines of cars will be handled. The new business will open about Sept. 1.

### Production of Coal and Distribution Satisfactory

The week's coal production while not establishing any new records has been heavy, closely approximating the best week the country ever experienced. Car supply has also been good, in some few cases equaling or even exceeding requirements. The accumulation of stocks is gradual and most pronounced in the case of the domestic and small industrial consumer. Railroad stocks are increasing with slowness as are also those of big industrial consumers.

The householders on the other hand are accumulating their winter's supplies, and it is probable that by cold weather there will be but few that ordered their coal last spring that will not have a supply sufficient to carry well into the winter.

Recent fear of congestion at various points, particularly in New England, has arisen more from a shortage of labor wherewith to unload cars than from lack of motive power. A greater variety of cars than formerly are also being employed in the coal trade and the use of other than dump bottom cars is occasioning considerable inconvenience. No one thinks of entering complaint, however, as all dealers and consumers are glad to get the coal irrespective of the car it is shipped in.

The Lake trade is heavy and it is probable that there will be no greater shortage in the Northwest during the coming winter than there was during the past.

In the Middle West some coal has been sold at less than the Government price. This is perhaps significant of the position that coal occupies in the market. Since the Government prices went into effect it has been seldom indeed that coal has been sold in the open market for less than the Government figures.

The car supply, taking the country as a whole, appears to be somewhat better than in some past weeks. In some localities in the East the car supply has been fully equal to the demand, while in Illinois some mines have only been able to work about three days per week. Much complaint is heard concerning this car distribution.—*Coal Age*.

### To Produce 300 Tractors Daily

DEARBORN, MICH., July 30—The new Fordson tractor plant to be built in Hamilton, Ohio, is expected to be in production within 90 days and will employ between 500 and 1000 men. The plant will manufacture and assemble tractors for Ohio, Indiana, Illinois and territory south of the Ohio River. About 300 tractors will be manufactured a day.

**Warner Joins Federal Truck**

DETROIT, July 29—Harry J. Warner, former vice-president of the Continental Motor Co., has associated himself with the organization of the Federal Truck Co. He will act as vice-president in charge of production.

H. O. Penland, who has been sales engineer for the U. S. Ball Bearing Mfg. Co., with headquarters in Cleveland since the first of the year, has been appointed manager of the Cleveland office.

H. A. Van Tine has become affiliated with the Hurlburt Motor Truck Co., New York, as factory manager.

Coulter Merrick has been made head of the automobile accessory department of the Merrick-Anderson Co., Ltd., Winnipeg, Man. He is the son of Joseph A. Merrick, secretary-treasurer of the organization.

H. A. Conlon has been elected vice-president of the Acason Motor Truck Co., Detroit, to succeed J. F. Bowman, resigned. He will have full charge of Acason sales. Both Mr. Conlon and Mr. Bowman have been associated with the Federal Motor Truck Co.

Howard C. Caldwell, assistant advertising manager of the Haynes Automobile Co., Kokomo, Ind., has resigned to enter the Great Lakes Training Station.

Guy W. Morgan, former president of the Abbott Motor Corp., Detroit, who was in charge of the spare parts, tires and accessories for the original Motor Transport Section of the United States Army, has been appointed to similar duties under Colonel Glover in the new Motor Transport Service.

J. Monroe has been appointed district manager for the Denby Motor Truck Co. in the Rocky Mountain section, and will make his headquarters at Denver.

E. C. Molitor, for 8 years a district manager for the Cadillac Motor Car Co., Detroit, formerly with the General Motors Export Co. in the West Indies and South America, is now general sales manager of the Isko Co., Chicago.

A. B. Walker, until recently associated with the Budd Wheel Corp., Detroit, has joined the Bureau of Aircraft Production and will report immediately at a station in the East.

**Williams Foundry Elects Officers**

CLEVELAND, July 29—At the annual meeting of the Williams Foundry & Machine Co., the following officers were elected: President and general manager, F. E. Holcomb, vice-president, S. F. Zili-ox; secretary and treasurer, William Leary. These officers represent the interests which purchased control of the organization last fall. A 3-story building, 275 x 40, has been added which is devoted exclusively to the manufacture of Akron-Williams tire repair equipment.

## Men of the Industry

*Changes in Personnel and  
Position*

**Acme Adds to Personnel**

CADILLAC, MICH., July 29—The Acme Motor Truck Co. has made several additions to its sales organization. G. M. Rockwell, formerly associated with the Republic Motor Truck Co., has been appointed district manager and special representative of the Acme Motor Truck Co., Cadillac, Mich., in charge of Virginia, Maryland, Delaware and North Carolina territory. J. A. Bell has been appointed district manager of the Gulf states east of Texas. F. P. Walker, formerly associated with the Hupp Motor Car Corp., will have charge of Acme sales in Nebraska and the western half of Iowa.

**Lacey Leaves Cunningham**

ROCHESTER, N. Y., July 26—V. E. Lacey, for eight years chief engineer of the James Cunningham Sons Co. of Rochester, manufacturers of high grade motor cars, has resigned to devote his entire attention to the Rochester Boat Building Works, now operating on government contracts. G. E. Franquist, formerly of the Simplex Motor Co., will succeed Lacey.

**Moore Is White's New York Manager**

CLEVELAND, July 26—William H. Moore, formerly manager of the White Co.'s Pittsburgh branch, has been appointed manager of the New York branch, to succeed R. H. Johnston, recently assigned to special executive work, with headquarters in Washington.

**To Use Amber Lenses in Massachusetts**

BOSTON, July 30—The Massachusetts Highway Commission has announced that a new regulation has gone into effect which legalizes the use of amber or yellow-tinted headlamp lenses in the state.

Herbert A. Townsley has been elected secretary of the Akron Automobile Co., Akron, succeeding Grover Reese, resigned.

H. M. Prewett has been appointed district manager of the Detroit branch of the Willard Storage Battery Co., in charge of service station sales. S. S. Jenkins, formerly district manager at Detroit, has been made district manager in charge of manufacturers' sales, with headquarters at Detroit.

Joseph L. Hardig, for several years with the Curtis Advertising Co., has been appointed director of advertising of the Remy Electric Co., Detroit. He will direct the national, trade paper and newspaper advertising of the Remy, which is a member of the United Motors Corp.

**Hamilton Heads Lane Truck**

KALAMAZOO, MICH., July 22—At a directors' meeting of the Lane Motor Truck Co., L. M. Hamilton, formerly secretary, treasurer and general manager of the company, was elected president and general manager. Dr. W. W. Lang, former president, was forced to retire from that office due to other obligations. Edward W. Bitzer was added to the board of directors and elected secretary-treasurer.

John A. Drake, associated with the Campbell-Ewald Co., Detroit advertising agency, has joined the United States Army, and is stationed at Camp Custer. He has the rank of corporal.

R. B. Merrill has been appointed director of material purchases by the Swope-McCracken Co., Detroit, production machinist, which supplies materials to automotive companies. He was formerly connected with the Ford and Packard companies.

A. C. Westfall, former traffic manager for the Cadillac Motor Car Co., Detroit, has become associated with the Lincoln Motor Co., Detroit, in a similar capacity.

J. F. Bowman, vice-president and general manager of the Acason Motor Truck Co., Detroit, has resigned, and H. A. Conlon, sales manager, has been elected vice-president and director of sales. Mr. Bowman has been an official of the company for the past year, having resigned as sales manager of the Federal Motor Truck Co. after 5 years' service to take the position.

C. M. White, Jr., has joined the Firestone Steel Products Co., Akron, as sales manager. For the last 3 years he has been factory representative of the Detroit Steel Products Co., and previous to that, manager of the Stromberg Motor Devices Co.

**Edwards Heads Milwaukee Show Committee**

MILWAUKEE, July 29—Frank J. Edwards, head of the Kissel-Kar Co. and the Edwards Motor Car Co., Dodge dealer, has been appointed chairman of the show committee of the Milwaukee Automobile Dealers, Inc., to take charge of the annual fall show to be held in conjunction with the Wisconsin State Fair at Milwaukee, Sept. 9 to 14.

At the latest meeting of the association the proposition of enlarging the scope of the body to include truck, accessory and supply and tire divisions was considered, and a special committee appointed to investigate the feasibility of the plan and ways and means of carrying it out. The M. A. D. is now distinctly a motor car dealers' organization, and the proposed changes would make it a broad trade association covering all lines of activity in the industry. A joint meeting of the various elements is planned to be held shortly.

## Chevrolet-General Motors Stock Transfer Is Coming

NEW YORK, July 30—It is regarded as probable that the formal transfer of stock between the Chevrolet Motor Co. and the General Motors Corp., by which Chevrolet becomes a division of General Motors, will be effected within a very short time. Although the complete plan has been ratified by both companies, the actual transfer of stock has not been made yet. That this will be done soon, however, is indicated by the fact that the Capital Issues Committee has taken favorable action on the application of the General Motors Corp. to issue \$28,000,000 additional common stock with which to acquire the Chevrolet property.

### Machine Shop Addition for Falls Motor

SHEBOYGAN FALLS, WIS., July 29—The Falls Motors Corp. will erect a machine shop addition immediately. This will be a 2-story building, 60 x 125, and is to be used for the completion of Government contracts for truck, airplane and tractor engines and parts.

### Highway Trailer Erecting Addition

EDGERTON, WIS., July 29—The Highway Trailer Co., which is executing Government contracts for trailers for hauling airplanes, ordnance and quartermaster supplies, is erecting a new shop, 10 x 250 ft. James W. Manhall is general manager.

### North-Light Motor Adds

TORONTO, ONT., July 29—The North-Light Motor Co., with offices in the Wesley Building, has taken over the 2-story factory at Hamburg, formerly occupied by the Silversmith Mfg. Co. A 4-cycle, high-speed gasoline engine, for boats, automobiles, trucks and tractors, as well as stationary engines, will be manufactured.

### Additions for Motors Metal

DETROIT, July 29—The Motors Metal Mfg. Co. is erecting two large additions to its plant to take care of a Government order for metal parts to be used on ambulances. One building is 60 x 200, the other 60 x 50.

### Addition for Wilson Body

DETROIT, July 29—The C. R. Wilson Body Co. is erecting a three-story addition to its factory at Clay Avenue and the Grand Trunk Railroad.

### Litnum Bronze in Production

MILWAUKEE, July 29—The Litnum Bronze Co., organized some time ago by Milwaukee and Menomoneie capital, is completing the work of converting the former plant of the Laursen Automatic Pump Co., Menomoneie, into a foundry, rolling mill and manufacturing shop for

## Current News of Factories

*Notes of New Plants—Old  
Ones Enlarged*

the production of Litnum bronze material under the Ampco patents. The plant is already producing a limited quantity of welding rods for use in the oxy-acetylene process, and within a short time will be making billets. The plant will be equipped to manufacture bronze wire, tube stock and similar material.

### Limousine Top Expands Plant

KALAMAZOO, MICH., July 22—The Limousine Top Co. has awarded a contract for the erection of a new building immediately adjacent to its present plant. Work has already begun on this structure.

### Knight Tire Increases Output

CANTON, OHIO, July 29—The Knight Tire & Rubber Co. has increased its output from 200 to 760 tires per day.

### Michigan Steel Castings Expands

DETROIT, July 27—The Michigan Steel Castings Co. is erecting an addition to its plant which, when completed, will add 53,700 sq. ft. At least 100 additional men will be employed. The building will be used for moulding, core making and the engineering department. The new unit will be completed in the fall.

### Clark Equipment Opens Auditorium

BUCHANAN, MICH., July 23—The Clark Equipment Co. has provided an auditorium for its employees which may be used for athletics, theatricals and motion picture exhibitions. It has a seating capacity for 625 persons, and contains a complete stage with lighting and scenery.

### Capital Increases

CANTON, OHIO, July 23—The Timken Roller Bearing Co. has increased its capital stock from \$200,000 to \$10,000,000.

AKRON, July 23—The Western Reserve Rubber Co., Akron, has increased its capital stock from \$10,000 to \$50,000.

### General Aluminum Increases Capital

DETROIT, July 29—The General Aluminum & Brass Mfg. Co. has offered for sale a new issue of \$155,640 common stock and \$77,820 of 7 per cent preferred stock. The new stock is offered to present holders in the ratio of 30 per cent of the par value of the common stock holdings and 15 per cent of the preferred stock of July 10 record. Payments may be made in equal instalments, Aug. 10 and Sept. 10.

## G. M. to Build Tractors in Monroe Motors Plant

PONTIAC, MICH., July 29—Two Samson tractors have been completed in that part of the Monroe Motors Co. plant which the General Motors Corp. leased some time ago. The schedule calls for 500 tractors in that plant. By the time these are finished it is expected that the tractor plant which the General Motors Corp. is erecting in Janesville, Wis., will be ready for operation. The report that the company intended to take over the entire Monroe plant is denied. At the Stockton, Cal., plant of the General Motors tractors for the Western trade and export business are being built. There are enough standing orders to keep that plant running for some time to come.

### Evinrude Motor Making Grenades

MILWAUKEE, July 29—The Evinrude Motor Co., manufacturer of detachable rowboat engines, has converted 60 per cent of its capacity for war work. The company has received a contract for phosphor hand and rifle grenades. About 40 women are employed, and this number will be increased to 100 on Aug. 1.

### Addition for Obenberger Forge

MILWAUKEE, July 30—The John Obenberger Forge Co. will erect a forge shop addition immediately for the manufacture of crankshaft, camshaft and similar forgings for the Government. The present plant was erected in 1916, and has been undergoing constant enlargement during the last 9 months.

### Twin Fire Spark Expands

DETROIT, July 30—The Twin Fire Spark Plug Co. has moved to a larger factory at 720 Grand River Avenue. The company's dealer organization has also been enlarged considerably.

### Bailey-Drake Offices Moved

CHICAGO, July 23—The Bailey-Drake Co., which represents manufacturers selling the jobbing and manufacturing trade, has moved its main offices to 1118 South Michigan Avenue. The company has branches in Minneapolis, Kansas City, Seattle and San Francisco.

### General Aluminum Enlarges Factory

DETROIT, July 29—Construction on an extensive scale of factory buildings for the General Aluminum & Brass Mfg. Co. is now under way. The buildings are being added to the company's group, and are to be used in completing war work for the Government. The new units are as follows: Aluminum foundry, 2 stories, 100 x 100; brass furnace building, 40 x 100, to be equipped with sand bins in the basement and with simplex and coke furnaces.

## Ordinance Contracts

WASHINGTON, July 29—The Ordnance Department of the United States Army has placed the following contracts and purchase orders:

Hale & Kilburn, Philadelphia; trays for supporting sewing machines, pedestal stands, vise plates.

Hydraulic Pressed Steel, Cleveland; steel billets.

Greenfield Tap & Die Corp., Greenfield, Mass.; adjustable tap wrenches.

Four Wheel Drive Auto Co., Clintonville, Wis.; tubular radiator.

Salisbury Wheel & Axle Co., Jamestown, N. Y.; Nash quad axles.

Sparks-Withington Co., Jackson, Mich.; dies for making shin guards.

Ford Motor Co., Philadelphia; overhauling trucks.

West Steel Castings Co., Cleveland; steel motor truck wheels.

B. F. Goodrich Rubber Co., Akron; rubber packing for howitzers.

The Nash Motors Co., Kenosha, Wis.; repair parts for Nash quad ammunition trucks.

Russel Motor Car Co., Toronto; machining shells.

Ford Motor Co., Detroit; set dies and tools.

Detroit Copper & Brass Rolling Mills, Detroit; cartridge case disks.

Elsemann Magneto Co., Brooklyn; magneto.

Nash Motors Co., Kenosha, Wis.; steering knuckle arms.

L. S. Starrett Co., Athol, Mass.; tools for 4-ton trailer.

H. Channon Co., Chicago; tools for artillery repair trucks.

Inley Mfg. Co., Indianapolis; light repair truck bodies.

The White Co., Cleveland; standard 1-ton truck chassis.

The Standard Tent & Awning Co., Toledo; tarpaulins for truck chassis.

The Nash Motors Co., Kenosha, Wis.; repair parts for Nash trucks.

Hale & Kilburn, Philadelphia; searchlight covers.

Edward G. Budd Mfg. Co., Philadelphia; release mechanisms for airplane flare.

## Seek Bids for Canal Supplies

WASHINGTON, July 29—Sealed bids in triplicate are invited by the General Purchasing Officer of the Panama Canal, Washington, D. C., to be filed not later than 10:30 August 1, and furnished by steamer, free of all charges, on dock at either Cristobal (Atlantic Port) or Balboa (Pacific Port) Canal Zone, Isthmus of Panama. Full details regarding the

## Contracts

form of contract, guaranty, etc., can be secured from the Washington office of the Panama Canal.

The articles specified follow:

500 feet cable, ignition, combination, high tension, single strand, 31-64 in. outside diameter of finished cable; to be suitable for severe tension service, "Packard" or equal.

12 Horns, Klaxonet, hand, type "S", for Indian motorcycles.

24 Horns, hand, Klaxon, type "L", for motor boats.

24 Pumps, tire, automobile, motorcycle and bicycle, to be equal to Cyclone pump shown on page 90 of Iver Johnson Sporting Goods Company's "Lovell Diamond" Bicycle Catalog; to fit standard automobile, motorcycle or bicycle valve stems.

12 Pumps, auto tire, 3-cylinder; to be equal to No. 9401, page 70, Catalog No. 9, Automobile Sundries Co., New York City.

200 Asbestos gaskets, 4 in. x 6 in. x 3/4 in. x 1/4 in. handhole.

60 Asbestos gaskets, 12 in. x 16 in. x 1 in. x 1/4 in. manhole.

Above gaskets to be in accordance with Panama Canal specification No. 329.

800 lbs. 1/4 in. packing, sheet, asbestos, millboard, plain, 40 in. x 40 in.

1800 lbs. 1/4 in. packing, sheet, asbestos, millboard, plain, 40 in. x 40 in.

Asbestos millboard must be made up of not less than 70 per cent pure long-fibered asbestos. It must be boxed for ocean shipment in boxes not containing over 75 lbs. It must stand a dry heat of 400 degrees F. without injury and not burn or disintegrate when dipped in acid.

500 lbs. packing, asbestos, sheet, brass wire insertion, 1/16 in.; to be in accordance with Panama Canal specification No. 327.

125 lbs. packing, fibre, sheet, red, 1/4 in. x 12 in. x 36 in.

25 yards drill, rubber, white back, 22 ounce, 50 in. wide, in one piece.

350 feet belting, rubber, 6-ply, 8 in.; to be in accordance with Panama Canal specification No. 331.

15 soft rubber valves, diameter 4 1/2 in., hole 1/4 in., thickness 1/4 in.

25 soft rubber valves, diameter 3 in., hole 1/4 in., thickness 1/4 in.

75 medium rubber valves, diameter 4 in., hole 1/4 in., thickness 1/4 in.

25 medium rubber valves, diameter 4 in., hole 1/4 in., thickness 1/4 in.

Above valves to be in accord with Panama Canal specification No. 326.

6 Pairs rubber boots, size 8, hip.

12 pairs rubber boots, size 9, knee.

3000 feet hose, fire, canvas, rubber-lined, 3 1/2 in., in 50-foot lengths, complete without couplings.

Specifications for above can be secured from Panama Canal Office, Washington, D. C.

## Dividend Declared

The Paige-Detroit Motor Car Co. has declared a monthly dividend of 2 per cent, payable Aug. 10 to stock of record July 31.

## Engineer Contracts

WASHINGTON, July 27—The following contract was awarded to-day by the General Engineer Depot, War Department:

Dayton Rubber Mfg. Co., Dayton; Dayton airless tires and mounting tires.

WASHINGTON, July 27—The following contract was awarded by the Bureau of Supplies and Accounts, Navy Department:

Republic Motor Truck Co., Alma, Mich.; motor trucks.

## Seek Bids for A Trucks

WASHINGTON, July 29—Bids for the manufacture of class A trucks will be opened at 11 a. m., Monday, Aug. 5, by the Motor Transport Service. Bids are requested for the manufacture of 5000 of these trucks.

## Bids for Tractors Sought

WASHINGTON, July 24—The U. S. Indian Office requests bids on the following articles to be filed before 2 p. m., Aug. 2, 1918. A certified check of 5 per cent of the amount of the bid or a proper bond, must be submitted if the bid amounts to more than \$500. If the bid amounts to more than \$5,000 it will not be accepted.

1. One 12-to-16-ton capacity per hour ensilage cutter with automotive self-feed attachment and extension siding table connected to feed; provided with automatic safety device to protect feeder against knives; all gears and chains covered to protect operator from injury; to be all steel and mounted on trucks; all bearings to be self-aligning; cutter to be flywheel type with 3 knives and fan attached to flywheel to be about 42 in. diameter; size of cutter at throat to be 1/2 in. to 1 1/2 in.; to be equipped with 35 feet of 9 in. heavy blow pipe with deflector hopper joint and 30 feet of detachable joint distributor pipe.

2. One 10-to-20-h.p. farm creeper type tractor operating successfully on kerosene or distillate, so equipped as to give proper revolutions per minute for above ensilage cutter; tractor to be fitted with extra extension angle lugs and equipped with adjustable hitch so it can be fitted to any kind of farm implement.

3. One endless canvas belt 100 ft. long, 8 in. wide, 5 ply for above equipment.

4. Also quote for use with ensilage cutter and complete with belt a 20-h.p., 3-phase electric motor, 440 volts.

Bids on high wheel tractors will also be received and receive consideration. Articles not differing radically from the above specifications will also be considered.

## Calendar

## RACING

- Aug. 3—Uniontown. Uniontown Speedway Assn.
- Aug. 10—Providence, R. I.
- Aug. 17—Sheepshead Bay.
- Sept. 2—Uniontown. Uniontown Speedway Assn.
- Sept. 7—Chicago. Chicago Speedway.
- Sept. 21—Sheepshead Bay.
- Oct. 5—Cincinnati. Cincinnati Speedway.

## ASSOCIATIONS

- Aug. 5—Atlantic City, N. J. Motorcycle and Allied

- Trades Assn., United Cycle Trade, Cycle Jobbers of America, Cycle Parts and Accessories Manufacturers' Assn. and Bicycle Manufacturers' Assn., Hotel St. Charles.
- Oct. 7-12—Milwaukee. American Foundrymen's Assn. and 5 allied organizations. Milwaukee Auditorium.

## SHOWS

- July 29-Aug. 4—Salina, Kan. National Tractor Demonstration. "Auspices of National Implement and Vehicle Assn."

- Aug. 6—Fulton, N. Y. Tractor Demonstration. New York State Food Commission.
- Sept. 2-7—Indianapolis, Indiana. State Fair. Indianapolis Automobile Trade Assn.
- Sept. 9-14—Milwaukee. Milwaukee Automobile Dealers, Inc. Fourth Annual Wisconsin State Fair. Hart J. Ruddle, Mgr.
- Sept. 14-21—Chicago. Automotive and Accessories War Exposition. Municipal Pier.
- Oct. 14-27—Dallas, Tex. Seventh Annual Texas Automobile Show. Texas State Fair.

- Oct. 16-18—Ottawa, Ont., International Plowing Match, Tractor and Farm Machinery Demonstration. Experimental Farm.

## ENGINEERING

- Sept. 2—Cripple Creek, Colo. American Institute of Mining Engineers.
- Nov. 14-15—New York. Society of Naval Architects and Marine Engineers. Twenty-sixth general meeting. Engineering Societies Bldg., 29 West 39th Street.

# The Crisis Proves The Car

## In the Very Face of Curtailment Hudson Dealers Find Reason for Self-Congratulation

Hudson dealers are feeling the curtailment in production keenly.

They're asking for more Super-Sixes every day than can possibly be delivered in a month.

It is costing them money not to get them.

And yet they're not whining.

They seem disposed to accept conditions much in the spirit of the French—shrug their shoulders and make the best of it—"C'est la guerre".

In fact, we believe there is not a Hudson dealer who is not congratulating himself more than before.

Why?

Because this crisis is proving again—more emphatically than ever—the caliber of the car he handles.

It almost seems as if Hudson engineers built three years ago with the present crisis in mind.

The power and endurance they put into the Super-Six then and have refined and improved since is proving the Hudson essentially a war-time car.

Hudson quality is the quality that endures.

With the need for automobile transportation greater and the requirements more severe, Hudson Super-Sixes are "seeing their owners through".

Little wonder that it stimulates a man's pride to handle a car like the Super-Six.

These are the reasons why, in the face of curtailment, Hudson dealers find good reason for self-congratulation.

Hudson Motor Car Company

Detroit, Michigan

## UTILITY *Protected Foot Rail* HEATER

### WHY NOT PREPARE FOR WINTER TRADE NOW?

Cold weather will soon be here, with a greatly increased demand for Utility Heaters. Our live dealers are ordering now, as there is already a well-established demand for Utility Heaters. It is to the advantage of every dealer and jobber to see that he can supply the trade. Better not wait—send in your initial order now.

The Utility Heater is the accepted standard of motor car heating. Its principle is sound, logical and convincing. It insures perfect driving comfort, even in the coldest weather, by tempering the atmosphere of the car to any desired degree. It keeps you warm all over, as though you were in a carefully heated house.

UTILITY Protected Heater—installed in place of the foot rail—is the heater universally recommended by thousands of motorists during the past season—the heater jobbers catalog and the heater manufacturers you will know install as standard equipment.

Ease of installation, attractive appearance, freedom from dust, odor or trouble make it the highly desirable heater.

*DEALERS—Ask your jobber or write to us for details*

## Provision of Adequate Housing Facilities Big Tractor Problem

Makers Must Insist on Farmers Taking Care of Their Machines  
as a Conservation Measure—Need for Standardized Parts  
More Apparent—Air Cleaners Are Important

By David Beecroft

**K**ANSAS CITY, August 5—A major problem confronting the farm tractor industry is that of adequately housing the tractor on the farm and not leaving it all winter in the corner of the field where it finished the last job. The Kansas farmer—this may also apply to the farmers of many other states—is notorious for his carelessness with farm machinery.

Yesterday we drove from Salina, where the National tractor demonstrations were held, to this city through one of the finest winter wheat-growing areas, and it was almost agonizing to see the wrecks of farm machinery strewn around nearly every farmyard. One could not fail to feel how inconsistent we are as a people in permitting this enormous annual waste of metal in these days of steel conservation when we are restricting the uses of steel in many useful and essential industries.

The average farmer is a poor hand at caring for his machinery. Perhaps this is due to the fact that the machinery makers have not been continuously insistent enough that he do this. We are led to this conclusion by the fact that you will find on the same farm that we saw yesterday a good, modern, up-to-date garage that will accommodate two motor cars, and in the farmyard surrounding this garage you will see standing out, exposed to the weather, such farm machinery as binders, corn harvesters, mowing machines, plows, harrows, disks, and in some instances tractors.

The fact that the farmer has built not only a single garage but a double one is evidence that he is susceptible to advice as to the care of his farm equipment. His car is

as clean-looking as those kept in the average western town or city. Undoubtedly the automobile manufacturer and the automobile dealer have been largely responsible for this. They have taught the farmer his first lesson in caring for machinery.

There is a strong hope that through this same channel the farmer will be taught to give better care to his tractor and his farm machinery as well, because this same automobile dealer who sold him his automobile is now selling him his tractor, his threshing machine, his plows, his disks, his seeders and his other tillage instruments. Many of these dealers are to-day automotive dealers in every sense of the term.

If tractor manufacturers will constantly urge through their dealers the propaganda of caring for farm machinery, it will not be long before the disgraceful sight of farmyards strewn with weather destroyed farm machinery will be corrected to quite an extent. The destruction of farm machinery by this cause is of such proportion that the local Councils of National Defense should take it up and institute a general movement for the conservation of these machines, thereby conserving our supply of steel and also conserving labor.

It is not unusual to see as many as three binders standing in the corner of a large wheat field, perhaps in the shade of a few trees. Some of them have the canvas for elevating the grain removed and others have not. Where the canvas is not removed \$70 or \$80 will be required next year to put in new canvas to take the place of that rotted during the winter. This canvas is made from

# Views at the Salina Tractor Demonstration

Where the Various Types of Tractors and Farm  
Implements Were Put Through Their Paces

*General view of plowing scene at the Salina tractor demonstrations*

*This tractor has stood outside for a year; so has the plow attached to it. It is a bad advertisement for the tractor as well as the farm*

*The International Harvester Co. demonstrated its two-wheel tractor unit pushing a binder, so that one man could operate the tractor and binder*

*The Fordson tractor disking on newly plowed soil at the Salina demonstration*

*The Model H Parrett 12-25 tractor which made a 103-hr. test and plowed night and day for 80-hr.*

*The wrong way to do it—here the operator sits on the binder and controls the tractor by extension controls. He should sit on the tractor and have the binder controls brought close*

*Right—This is a typical farm yard in Kansas showing how machinery is left outside to rot and rust. On this farm is a good double garage for the automobile and buggy*

*Above—Double garage on a farm near Salina, Kansas. If the farmer will build a garage for his automobile he can also be induced to build a house for his tractor*

*Right—Corner of a large Kansas farm showing machinery overgrown with weeds. This farm has a good garage, sleeping porches and electric lighting*

*On hundreds of farms in Kansas you see these cement silos for corn. Generally there are one or two cylinders, but this one has four. Yet on this farm the machinery is not housed*

practically the same material as is used in automobile tires, and here is another instance of permitting the farmer on one hand to waste this precious material and denying it or issuing it in restricted quantities to the tire manufacturers on the other hand.

Complete revolution must take place in the farm machinery field so far as the care of it is concerned. The automotive manufacturer must take a hand in this work and there is no time more opportune than the present.

The redesigning of farm machinery so that it can be operated by one man, preferably the one who rides on the tractor, has not made as good progress during the year as it should have. This work is one of the important ones facing the tractor manufacturer and also the manufacturer of farm machinery. There is no help on the farms to-day for two-man machines—that is, one man driving the tractor and the other seated on the binder or another piece of farm machinery.

#### Implements Must Be Redesigned

It is necessary to turn the farm machinery almost directly around; heretofore the farmer has ridden on the back of the machinery and the levers for controlling it have been placed to be convenient for him in that position. With the tractor hitched ahead of the machine, it is necessary to rearrange these levers and bring them up to the front so that they can be operated by the man riding on the tractor.

Farm machinery manufacturers were urged last fall to redesign their machinery along this line and the progress is rather disappointing. One or two manufacturers have revamped some of their binders but the work has scarcely been started.

A few machinery makers think that the operator can ride on the binder, for example, and control the tractor through an extension of the steering gear and with some system of ropes for regulating the engine speed and the clutch. This latter scheme is not generally looked upon as satisfactory, the general conclusion being that the operator should ride on the tractor and the farm machinery should be modified to make its operation quite easy from the tractor.

The necessity for a greater supply of standardized parts for use in the tractor, which was mentioned last week, has been further impressed as the demonstrations have progressed. There is urgent demand for a good design of steering gear which can be fitted on many makes of tractors. Such a steering gear should be quite inclosed with adjustable parts, the same as on a motor truck or motor car. Two or three firms have already intimated that they are developing such a type but none which seems to measure up with all of the requirements has as yet come on the market.

The extent to which a steering gear, which is not properly protected, wears out was evidenced at the Salina demonstrations, by a farmer who operates a tractor with an exposed type of steering gear. It has been necessary to replace the steering gear twice each year since he installed the machine. The cost of two new steering gears per year is a factor in itself, but another factor not to be overlooked is the time required in making the replacement and the added cost if this is to be done by a mechanic from a garage or tractor service depot.

#### Need More Standardized Parts

The necessity for further standardization of tractor parts was apparent many times during the Salina demonstration and was frequently commented upon by engineers who are designing tractors, and by others who are making parts for tractors.

A case in question is that of the bell housing for engines intended for tractors. The bolt holes are too near the edge of the housing to give the necessary strength where the engine housing and the gearbox housing form a continuous bridge construction, making it possible to lift off the frame side members as every tractor maker is doing at present. Not only will the flanges on the bell housing have to be increased in size, but larger diameter bolts will have to be used to take the extra strain in this type of tractor construction. Now is the time to get this standardization work lined up, rather than allowing different engine makers to bring out their individual widths and diameter of flanges and to use their own diameter bolts.

A possible market for some standardized design of front axle was well evidenced at Salina where there were over twenty-five different designs of front axles in use. Many of these are the built-up types of axles made from bar stock arranged in different forms of bracing; there are others that are steel castings, and others that are forgings. It was a favorable comment on standardization to find not a few of those tractors that had different front axles using the same engine, the reason being they were able to buy a satisfactory type of engine but were apparently not able to buy a standardized design of axle that met their requirements. Had there been standardized axle designs, the same as standardized engine types, unquestionably these would have been used and a good deal of cost and labor conserved thereby.

If the Salina demonstrations accomplished nothing further than to prove it is possible to plow as well at high speeds as at low, this in itself was well worth while. In a 2-hr. plowing test, some of the smaller machines averaged 3.5 m.p.h. A year ago too many tractor manufacturers declared that it was impossible to plow at such a speed. The redesigning of mould boards on plows during the past year has demonstrated that you can plow as well as 3.5 m.p.h. as you can at 1.5 m.p.h. Plowing speed depends entirely on the shape of the mould boards of the plow. This redesigning of farm machinery thus putting it on a tractor pace as compared with horse pace is one of the hopeful tractor developments of the past year.

#### Air Cleaners Are Important

The question of air cleaners is still a mooted one in tractor design. While the centrifugal type of air cleaner still leads in the number of equipments, there is more attention being given to the water cleaner than there was a year ago. As yet, sufficient reliable data have not been compiled on the relative merits of the different types of cleaners to establish the future of any one type, and undoubtedly the salability of the different concerns will for some time be a determining factor as to which type of cleaner is used.

The air cleaner has the advantage of light weight and relatively compact shape. On the other hand, several of the water cleaners are rather large. They call for frequent replenishing of the water supply.

For the average farmer, it is a problem as to whether he can give the necessary attention to the water cleaner or not, especially because he is even neglectful of lubrication of the engine and many of the engine troubles are due to his failure to change the lubricating oil as frequently as he should, and to his failure to give the engine sufficient oil.

The water type of cleaner has already given indication that quite a percentage of the water passes in through the cylinders and where kerosene is being used as a fuel, this water does its part in reducing the temperature and preventing pre-ignition. Some tractor makers have mentioned that in tests they have noticed the disposition of the engine to heat up and lose power when the water in the cleaner is exhausted and after a replacement of water the engine has renewed functioning without any indication of heat.

#### Dealer Must Handle Service

The question of tractor service is one which the tractor manufacturer must pass on to the dealer. The time is past when the tractor manufacturer, if he is an old line implement man, can handle the service business by a corps of service experts traveling the country at the request of the farmer. These manufacturers are admitting this. They state unqualifiedly that the dealer must give the service and that in giving this service he must give it promptly and charge for it. By prompt service is meant giving the farmer spare parts and doing repair work for him within a few hours from the time the farmer telephones for such parts.

Tractor service must be taken to the tractor on the farm, as the tractor cannot be brought from the farm to the garage or the repairshop of the dealer. There is not a single tractor manufacturer who has a quantity of machines in use but who admits that the old service methods that have served for the binder and other farm machinery are inadequate for the tractor. There is not a tractor maker big enough to cover the country with the necessary number of service men to give adequate service on the machines in use.

This brings tractor manufacturers face to face with the

new problem of discounts to dealers and distributors. These manufacturers who have been giving a 15 per cent discount to dealers based on a service practice in the past will find it inadequate for the future. Some of the best dealers admit that it requires approximately 15 per cent to do business on, and that they cannot give necessary service on this discount.

The aggressive practical tractor dealer has already his service car or truck with which his mechanic makes trips of 10, 15 and as high as 30 miles in the country to repair tractors and farm machines. Up to the present the farmer has not been given a very strict schooling on paying for service for his farm machinery. Most of the machinery houses admit that they have handled the different cases as they thought best. In some cases they have charged for service and in other cases they have not.

In this respect, the old line implement dealer has not been a strong enthusiast on service. He has not been prepared to give any kind of service, but has passed the business along to the branch houses of the implement company. The implement dealer of this type has generally sided with the farmer, not only on the question of service, but also on the question of time payments on machinery.

The tractor manufacturer must recognize that his dealers have this handicap to overcome. They have to introduce the tractor. They have to educate the farmer in its use. They have to make many repairs and replacements for the farmer. Lastly, they have to perform many little service jobs which the farmer should be able to do himself. Tractor manufacturers must take recognition of this, and not forget that a healthy dealer means a healthy business. Unless the dealer is making money, he cannot be a good representative of the manufacturer.

The automotive dealer of to-day, on the other hand, is going to have an opportunity of making a little extra money out of the sale of farm machinery, which will partly recompense him for the cost of tractor service. When a dealer sells a tractor he generally sells the plow that goes with it. Some dealers are stocking these plows, but where the factory has a branch house in the territory it is scarcely necessary to do this.

There are dealers who are selling threshing machines, disk harrows and all other lines of farm machinery, and the

day has arrived when the automotive dealer is going to sell a large percentage of the farm machinery that goes with the tractor.

Tractor manufacturers should, in practically all contracts with dealers, insist on the dealer arranging to carry a small stock of spares. This is necessary for the good will of the tractor. It will greatly reduce sales resistance. The farmer is going to act a little differently in the purchase of the tractor as compared with the purchase of a motor car which may not be such a business proposition.

He was not averse to going 30 miles to purchase his new motor car, but is insisting on buying the tractor nearer home. As a result, there are springing up through the grain belt automotive dealers who are located in towns of 1000 population and are selling more tractors than dealers in places of ten times the population.

The farmer wants to buy his tractor as near home as possible. He knows that the dealer is then only a half hour from him instead of a half day or perhaps a day. The tractor to be a success must be kept working all the time, and the makers must co-operate with the dealer and assist him in carrying this load.

There is no necessity for a manufacturer or dealer giving free service. The farmer will pay for legitimate work done. But he insists on having this work done as quickly as possible. Having a tractor used for threshing laid up for a half day or one day is a serious loss as compared with a motor car or even a motor truck incapacitated for the same period.

Tractor manufacturers must work more closely with their dealers on this service problem than they have heretofore. They should offer their dealers special discounts where they carry stocks of parts above a certain value. They should offer special discounts where the dealer is prepared to give service by the way of service wagons and expert help specially for the farm use.

In this connection one of the makers of the farm lighting equipment has set up a good standard by insisting that all dealers have one man who gives all of his time to the sale of this article and that there be provision for moving a demonstrating unit through the territory. While this is selling service, it suggests how necessary it is to put tractor service on as high a standard.

## 100-Hour Plowing Test of Kerosene Tractor

**SALINA, KAN., Aug. 3.**—The Parrett model H tractor which started on July 26 to make a 100-hour non-engine-stop plowing demonstration on one of the large winter wheat farms four miles from this city completed its official test, which was conducted by J. B. Davidson of the University of California.

The engine was run on kerosene for 103 hr. and 19 min., during which period there were two stops totaling 5 min. and 40 sec., both of which were due to sediment collecting on the bowl in the fuel line between the kerosene tank and the carbureter. Outside of these two enforced engine stops the engine was running all of the time.

It was necessary to stop plowing for 13 hr. and 28 min. due to rain, during which time the engine was kept running at 360 r.p.m., which was a good idling demonstration with kerosene.

Throughout the demonstration accurate record was kept of kerosene, lubricating oil and water, as well as the depth of plowing. The tractor plowed for a total period of 80 hr., 42 min. and 20 sec., although this was not a continuous performance, there being several stops to take on fuel and make repairs. It was necessary to replace a defective bearing in the left front wheel requiring 1 hr. 28 min., most of which time was needed for getting the bearing.

Throughout its plowing period the Parrett averaged 2.4 m.p.h. while pulling its three 14-in. Oliver plows. This is quite a remarkable speed and demonstrated the argument that the tractor can work as efficiently at high speeds as at

low. Traveling at this speed it averaged .95 acre per hour.

Kerosene was used as fuel from start to finish. The average consumption was 1.99 gal. per hr. The official report gives the consumption on an hour-acre basis and places it at 2.008 gal. per hour-acre. The term hour-acre is similar to ton-mile in motor truck transportation, and has been used as the unit of measurement.

The consumption of lubricating oil approximated 1 gal. to every 12 acres plowed. During the 103 hr. and 19 min. the engine was running 6.5 gal. of oil was used. On a per-hour-acre basis this is .084 gal.

The Parrett tractor in this test used a water air cleaner and 7.5 gal. of water were used in this cleaner. The test unofficially demonstrated that a goodly portion of this water enters the cylinders and serves to keep the temperature of the kerosene mixture down. No other provisions were made for injecting water into the mixture.

During the 103 hr. and 19 min. 24.2 gal. of cooling water were used in the radiator, which approximates .314 gal. per hour-acre.

During the official test the depth at which plowing was done was measured 247 different times, and the average depth was 6.36 in., which is equal to that required by all scientific farmers who depend on winter wheat in the Kansas belt.

It was demonstrated during the test that night plowing can be done as efficiently as that done by daylight. The tractor was equipped with two Prest-O-Lite lamps which provided ample illumination.

# Non-Distributor and Multipolar Magnetos

## A Discussion of the Practical Possibilities of Magnetos Designed for Use with Separate Distributors on the Engine Camshaft—Multipolar Magnetos Delivering Up to Six Sparks Per Revolution

By Fred I. Hoffman

**W**ITH the exception of magnetos used for the ignition of gasoline engines with one or two cylinders, the magneto-electric machine for ignition purposes has been developed on lines that cannot be considered absolutely ideal. The inability of the manufacturers to design igniters to give any number of sparks per complete revolution has introduced most peculiar constructions and has not simplified or improved matters to the same extent as in other departments of automobile engineering. Attempts, no doubt, have been made, but the problem is not easy to solve satisfactorily, and great difficulties must be surmounted before any advantageous result can be obtained. Lack of reliable and authentic research data and the fixed idea that the wound H shuttle armature is the best have been responsible for the stagnation. Another reason (also very important) is the manufacturer's lack of knowledge of what is being done in other automobile producing countries.

The success of the Bosch Company, the well-known German firm, and its high reputation, are solely due to the supply of a very well made and accurate article from the beginning, when mechano-electrical ignition

machinery was in its infancy. A world-wide monopoly was thus created which left the impression upon the manufacturer and the public alike that generators working in a 2-pole field with the wound H armature were the acme of perfection and would remain so for some time to come. The stagnation in design on other lines but those embodying the original Bosch construction can clearly be traced and can be attributed to this German

Various types of magneto construction

form. It is quite evident that workers in this field with limited knowledge and capital would prefer to copy an existing successful article than to start experimenting with new ideas and thereby leave the trade in the possession of the firms first in the field. However, this alone is not the only reason. The reluctance of the engine builder to test and fit generators not of orthodox design and embodying features other than those of accepted practice is really the main cause. When so many improvements tending toward greater simplicity are being brought out, it is very strange to note the number of makers producing standard magnetos for multi-cylinder engines. Of course, the present day machine unit can be replaced in a few minutes by a new one and will fit in the place of any other make, but this is not the main advantage to consider. A professional man will find the replacing and retaining of any magneto a very simple procedure, but not so an inexperienced amateur driver, and considering the number of the latter drivers of vehicles we have to side with the civilian, so to say.

To simplify the ignition distribution, we have only to employ a multi-cylinder machine giving any number of sparks per revolution to suit the cylinders, or employ an ordinary magneto as used for single cylinder engines, but fitted with a double cam, and a high-tension distributor coupled to or driven off the camshaft gearing somewhere on the engine. The former arrangement is the ideal one, but the latter certainly is an advancement on the running practice.

A distributor arranged somewhere on the front, side or back, and fitted in a very accessible position, getting the current which is to be distributed from the magneto terminal by a single wire, will surely be looked upon with more favor than the self-contained apparatus. Another advantage of employing a distributor fitted on the engine proper lies in the wiring to the spark plugs, which in this form has not to be disturbed when changing the generator. The relative cost of a gearless magneto—even if we consider that an additional special distributor be employed—as compared with a machine with self-contained arrangement is certainly one-half. What plausible reason is there to burden a magneto with a set of gearing when a similar reduction transmission already is provided on all engines for working the valves and could be made use of? A magneto driven at a certain speed and giving the requisite number of sparks is all that is required. By utilizing such a firing system we get the following advantages as well: One standard magneto for engines with different number of cylinders; a standardized distributor, standard terminals, brushes, etc. The magneto would have smaller overall dimensions, would be lighter, more compact and neater in appearance; it would have less parts to wear and could be fitted and adapted in an easier way. It may be urged by the manufacturer of multi-cylinder magnetos that the generator with a distributing device fitted at a distance from its supply source requires an extra brush, which is liable to give trouble, but this is certainly not

the case. With the exception of a single magneto (a French make) there are no magnetos on the market using a wound H armature and doing away with the second primary brush, viz., the one on the other end from the slipping terminal connection.

The types of magnetos at present employed can be subdivided into those using a rotating armature with an H core and an induction coil, those having a stationary coil and a solid unwound rotating inductor sending the flux direct through the coil center and those that have a stationary coil winding which is being indirectly excited by a communicating or bridging agent revolving between field and core.

The number of periodic inductions per complete revolution of inductor, mainly depends either on the rotor or field design or the two combined (in some designs there are special combinations) and little on the relative position of the transformer unit. There are certain individual advantages in each one of the above mentioned constructions. The wound H, or Siemens' armature, is favored by a great many manufacturers, as this construction lends itself to a more robust design, the coil being direct and closely wound on the laminated core and fitted with condenser. The stationary coil magneto, on the other hand, employing an unwound simple rotor, either in shield rod or disc form, is cheaper to build, more easily repaired (for it consists of fewer parts) and is more durable. The rotating part being without any wiring whatever, is not subjected to the same centrifugal stresses as if wound. The disadvantages of this type are the somewhat longer path for the flux and the double airgaps, reducing the induction factor.

The number of sparks of the ordinary H pattern magneto in a two-pole field, as shown in the sketch, is two per revolution; the same applies to the design of the pattern with stationary coil and employing a two-ended inductor, bridging disc or core rotor. To obtain three sparks with a two-pole field the simplest form is the one with the coil between the magnet limbs and a star pattern rotor. Magnetos of the two-pole field type, giving four sparks per revolution and using a stationary winding, are those with a rotary divided shield or opposed pronged pattern rotor and a longitudinally or concentrically situated transformer. In one design the bobbin is mounted on the outside. Four interruptions can also be obtained by dividing the pole pieces symmetrically, thus making four poles and having the stationary coil in between the limbs or wound on the rotary armature. With a wound coil and a three-parted pole piece we can also get six sparks per revolution.

There remains now only one other principle for our consideration, and that is the multiple armature design. Although the four-pole magneto has not given really satisfactory results, it may be just as well to illustrate the two constructions for comparison with the others. It will be noticed that the one pattern employs a single coil, the other four individual ones, and both embody the rotary Siemens idea.

# With the British Airplane Forces

*Type of British observation plane which is used for spotting enemy gun positions and directing the Allied artillery. This machine is about to ascend*

*This view shows very clearly the twin type of machine gun which now is coming into more extensive use among the Allied forces. The pilot has just landed and is turning over his reports of enemy gun positions*

*The Royal Flying Corps does not discard anything where there is the barest possibility of salvage work. This view shows two machines which will be reconstructed, using parts of other machines which have been damaged through accident or by enemy gunfire*

# Sopwith Dolphin with Hispano Engine

*Front view of the Sopwith*

**W**E show herewith three views of the present principal British scouting machine, the Sopwith Dolphin. It is equipped with an eight cylinder high compression Hispano-Suiza Vee engine of 200 hp. At an altitude of 15,000 feet it is capable of developing a speed of 115 m.p.h. and its climb is 10,000 ft. in 8.3 min.

The armament consists of four machine guns. Of these two are Lewis guns mounted on a bar above the pilot's head, and two synchronized Vickers guns which fire through the propeller. One of the unusual features of this machine is the negative stagger of its planes, the top planes being set back from the lower planes. There are two pairs of struts on each side of the fuselage and the wing bracing is of the conventional type. Both the upper and lower wings are fitted with ailerons.

The upper wings do not run straight across but are set with a considerable space between them, where the pilot's seat is located. The forward end of the fuselage is covered with a cowl which gives about as good a streamline effect as is possible with a Vee engine.

There appear to be windows in the lower planes through which the pilot may observe the field below him. The radiator is mounted on the sides of the fuselage.

*Forward part of the Sopwith Dolphin*

*Side view of Sopwith Dolphin, showing negative stagger of planes*

# Organization of the German Army Aviation Service

Four Classes of Squadrons for Bombing and Reconnaissance, Artillery Work, Fighting and Photographing—Traveling Circuses Named for Their Leaders

**A**CCORDING to Major H. O. D. Segraves of the Royal Flying Force, who was interviewed in Washington a day or two ago by a representative of AUTOMOTIVE INDUSTRIES, the German reconnaissance or photographic aviator never makes an attempt to secure his information or to make photographs when trouble in the form of a hostile aviator appears on the horizon. Instead, he stops his work and implicitly obeys instructions from headquarters, getting away as fast as possible.

The German aviation service on the Western front is commanded by Col. von Tomsen, who is stationed at German general headquarters at Charleville. Col. von

Tomsen is under General von Höppner, who is in charge of the aviation service of all the German armies and is located in Berlin. The "flugchef," Major Wildt, who is in direct charge of a series of staff officers, assigns one to each aviation unit of the army.

"The German squadrons," said Major Segraves, "receive their orders from and are solely responsible to the staff officers."

"The squadrons are divided into four classes: Bombing and reconnaissance, artillery, fighting, and photographic. The first two are carried out only when specially ordered. From time to time a long distance

*This photograph of the Somme battlefield shows the immense value of the "eyes of the air," the photographing airplane. Without this complete and accurate picture of the enemy's lines, an army would be well nigh helpless—with it, it is prepared, knows the exact artillery range and meets the enemy promptly*

What was left of Bullecourt village in the Hindenburg line after the artillery of the British finished its work. The trenches are prominent

reconnaissance squadron is specially sent out to report on movements of trains, etc. The second, artillery work, is performed by squadrons especially equipped for this duty, and for this duty alone, each machine being fitted with wireless.

"Fighting is done by the special Jagdstaffeln, or 'traveling circuses,' as they are called, comprising 18 pilots all picked for their skill in fighting and fitted out with the latest and best types of machines that Germany can produce.

"These squadrons are not numbered or lettered, but are called by the name of the squadron commander, as 'von Richthofen's Squadron,' etc.

"The traveling circuses have no fixed airdrome, but tour up and down the lines, staying usually close to where the fighting is thickest, hence the name 'traveling circus.'

"In addition to the Jagdstaffeln, each artillery squadron has attached to it two or more scout machines which go up and protect the pilots on artillery observation. Their duty is not so much to attack as to defend in case of attack, when they engage the opponents until the observer is safely away. As a rule these scout pilots are not as efficient as the pilots of the traveling circuses.

"The Germans place far more individual value upon a machine than we do. When

a squadron is moved to a different airdrome the pilots never fly their machines there. They always go by motor truck transport, and for this purpose practically every type of German machine is so made that it can be dismantled in about 15 minutes.

"The German machines vary considerably in type. The fighting scouts used principally are the Fokker triplane, the Pfalz and the Albatross VA. Baron von Richthofen, premier German aviator, was shot down while using a Fokker triplane. These machines have a speed of about 116 m.p.h. near the ground and a climb of 10,000 ft. in about 10 minutes. The engine is a 9 cylinder rotary Oberursel, a German copy of the French Gnome. The next machine, the Pfalz, is practically the same as the Albatross VA, which made its first appearance on the Somme in June, 1917. The performances of the two machines are very similar. Speed near the ground is about 108 m.p.h., with climb to 10,000 ft. in 11 or 12 minutes.

"The chief bombing machines include the

A photograph of German trench positions. An excellent example of the war territory, filled with trenches, shell holes and barbed wire. The photograph was taken at a height of 1000 ft.

A.E.G., a twin engine bomber with two 260 hp. Mercedes engines. They are used for short distance work behind the lines. Other bombing machines are the Gotha and the Friedrichshafen, the latter being of the Riesenflugzeug or giant airplane class. There is no actual machine named 'Riesenflugzeug,' as many people think. It merely denotes a certain class of machine of giant size, meaning literally 'the giant flying machine.'

"The Gotha and the Friedrichshafen types are used for all long range bombing work, such as the raiding of London. The engines are two 260 Mercedes or Maybachs.

"The speed of these machines ranges between 45 and 85 m.p.h. and the ceiling is about 15,000 ft., with full military load of bombs, guns, ammunition, etc.

"For artillery and photography work the Germans usually use the D.F.W., L.V.G., Albatross type D, Aviatik and the Hannover Fabrik. The latter is easily recognizable by its box tail.

"All the German machines are actually inferior to our machines as regards speed and ceiling. Even von Richthofen, in his diary, complained that his machines compared unfavorably with those of the Allies both in speed and ceiling.

"The same type of engine is almost universally used, namely, the 260 hp. Mercedes, which has 6 cylinders. It is a long stroke, low revolution, upright engine and has a minimum number of parts, making standardization easy.

"As regards the pilots themselves, little can be said that is not already known. They seldom attack unless the odds are 3 to 1 in their favor and even then fight only

over their own lines. The Hun flies, not for pleasure, but because he has to. He never comes across the lines to seek trouble as the Allied aviators do."

Describing the photographic work, Major Segraves stated that the photographing planes are always accompanied by two or three fighters who aim to protect the photographer, who, contrary to the German plan, sticks to his job despite an attack until he has the pictures he started after. The photographs shown on these pages were taken by British aviators and in the majority of cases were secured only by "sticking" despite attack.

The system of airplane construction, in England, works for very efficient results. The British air service offices in France send in their requirements for new machines to the Air Ministry at London. This division in turn notifies various airplane makers in the country, by means of special blanks, of just what types of airplanes they require. The forms used tell what the speed, climb, ceiling, etc., must be. Each manufacturer in turn studies the notice, and if he believes he can undertake the job, so notifies the Ministry. He is then sent sufficient money to proceed with blue prints and the manufacture of three airplanes. When these are completed they are sent to what is called Martlesham Heath, the greatest experimental air field in England, where they are given a thorough trial under supervision of a trial board. Those airplanes found to be best of all sent in by the various makers are then recommended as the new type. Blue prints are ordered from the original manufacturer and sent to each airplane factory with orders for specified numbers.

## A New Type of British Tank—The Whippet

*The name given to this newer type of Hun destroyer carries with it a suggestion of speed, but the speed developed is, of course, great only relatively. It is about 12 m.p.h. maximum. This British light tank corresponds to the "mosquito" tank of the French and the American two-man tank, which will soon be heard from*

# Gile Engine Employs Sub-Piston

Works on Two-Stroke Principle, with Piston-Controlled Port for the Inlet and a Poppet Valve in the Head for the Exhaust

**A** TWO-STROKE engine embodying several rather novel principles has been placed on the market by the Gile Marine Engine Co., 50 Congress St., Boston. The operation of the engine differs materially from that of the conventional two-stroke engine, and some of the disadvantages usually encountered with that type are overcome.

In addition to the regular trunk piston or working piston, there is in each cylinder what is referred to as a sub-piston which is operated from a special crank on the crankshaft. From this special crank a short connecting-rod leads to a lever arm pivoted near the base of the crankcase. On the same shaft on which this lever arm is mounted, there is another lever arm from which a link connects to a somewhat longer single arm lever in the upper part of the crankcase. The free end of this single arm lever connects through a short link to the lower end of the piston rod of the sub-piston. The motion of the piston rod is steadied by means of a cross-head moving up and down in a guide secured to the crankcase.

## Principle of Operation

During the power stroke the main and sub-piston both travel in the same direction and at substantially the same rate of speed. This continues until they have reached a point where the main crank is within 45 deg. of the bottom dead center, at which point the exhaust valve begins to open. As soon as the exhaust valve opens, the sub-piston is gradually stopped by the rocker arm movement described, and it then starts on

its return stroke. During this return stroke, the sub-piston scavenges the cylinder of the burnt gases, and at the same time it draws in a fresh charge of gas from the carbureter through the intake ports in the cylinder walls near the lower end of the stroke. These ports are uncovered by the main piston during the last part of its downward stroke.

During the time that the main piston uncovers the inlet ports at the bottom end of the stroke and closes them again, the sub-piston has reached the top end of the stroke and thereby has drawn in a full charge of fresh gas into the space between the two pistons. While the main piston completes the upward stroke, the sub-piston is practically stationary in its uppermost convention. It will be observed from the sectional view of the engine, herewith, that there is a series of flutes in the cylinder walls at the upper end, which afford a passage for the gas in the space between the main piston and the sub-piston, whereby it can get into the space above the sub-piston. Therefore, when the main piston reaches the upper end of its stroke, all of the fresh air has been transferred to the space above the sub-piston, or what is generally referred to as the compression chamber. As the transfer of the charge goes on at the same time as the compression of same, the gas passes through the flutes at considerable speed, and this has a tendency to keep the flutes clean and open. As the main piston reaches the top end of its stroke the gas has been fully compressed and is then fired by the ignition spark.

How the Aviator Uses Smoke, Incendiary, Demolition and Illuminating Bombs—  
Flare Lighting for Landing and Observation Work—  
The Training of a Bomber

**G**AS, smoke, incendiary, demolition and illuminating bombing exhibited in Washington at Congress Heights before important Allied and American officers recently demonstrated the close relationship between trench warfare and aviation. The exhibition was given by the trench warfare section of the engineering

*The demolition bomb used by airplanes. These bombs tear craters in the ground 80 to 200 ft. in diameter*

division of the Ordnance Department. The vast improvement in flares, bombs, and in the devices for shooting them was convincingly demonstrated. A DeHaviland airplane equipped with two Liberty engines fired four demolition bombs of medium size from an altitude of 2,000 feet, aiming at a target 30 feet in diameter and

*The illuminating bomb. This bomb is dropped by the aviator over the city he intends to bomb. At about 2000 ft. it bursts into a 30-ft. parachute with a light below of 350,000 candlepower, illuminating over a radius of 2 miles. The aviator is not blinded by the light nor revealed by it*

striking within a radius of 200 yards with each shot. Each bomb burst with a terrific concussion, tearing great holes in the ground, leaving craters 30 to 40 feet in diameter. The bombs used in the exhibit were made for demonstration purposes and of but one-fourth the effectiveness of the bombs used by the night bombing airplanes, which comparison shows the havoc created by the normal bomb.

Smoke bombs discharged from the plane burst, spreading a great pall of white smoke which combined with other smoke clouds discharged by ground soldiers into a screen that filled the entire valley, completely hiding

*At left—Explosions of smoke bombs dropped from an airplane. At right—Smoke screen, the result of smoke bombs dropped from an airplane and thrown by ground soldiers. The screen effectively hides operations from the enemy*

At left—**The night flare.** Two huge flares developing hundreds of thousands of candlepower are arranged, one at each end of the flying field, where they serve as beacon lights to aviators many miles distant. At right—**The night flare fully developed.** Here the telegraph post and the group of soldiers standing close to the flare box show how far into the sky the flare reaches

the operations of those on the other side. Gas bombs discharged clouds of gas fatal to any one within inhaling distance. Incendiary bombs containing inflammatory material splashed the earth with flaming fragments, starting huge fires almost as promptly as they exploded.

Nightfall developed a series of brilliantly lighted exhibits. Rockets were discharged which carried small parachutes and various colored lights high into the air. As the stick of the rocket broke from the stream of sparks the parachute on each opened and hung in the sky, displaying a small light with red, blue, yellow or green color. Each color has a meaning to the night bomber returning from or proceeding on a bombing expedition. Hand pistols known as "Very pistols" were also exhibited. These are used both by aviators and by the soldiers in charge of the hangars and at the trenches. They discharge parachutes with different colored lights to a distance of 50 feet and are also used for signaling at night.

Methods of illuminating hangars by night were displayed. A series of intensely bright lights are spread

The explosion of an incendiary bomb released by an airplane. These bombs explode into hundreds of pieces of highly inflammatory material. They quickly burn even the green grass at the demonstration field

The preparatory bombing stage school house. This house, with its roof open to the sky, is equipped with camera obscuras and Batchelor mirrors. The fliers are checked and traced on charts

*The flying formation of a bombing squadron, with the leader lowest and the following planes arranged in pairs on each side forming a V, graduating in altitude, with the last planes the highest*

around the outer edge of the landing field, making it easy for the aviator to effect a landing. Another method of lighting up the field is by means of two flares, one at each end of the field, which develop a light so powerful that the observers of the exhibit, standing on a bluff 2,500 yards distant, could plainly discern every movement of the individual soldiers below.

A most interesting exhibit was the aerial flare bomb which is discharged by the night bombing airplane to enable the aviator to see and select easily the objectives for his demolition bombs. This bomb is 36 in. in length and 8 in. in diameter, contains a parachute and material throwing an intense light. The bomb is discharged at a high altitude and bursts at about 2,000 feet, the parachute spreading over a 30 foot radius with the light developing 350,000 candlepower and illuminating a radius of 2 miles over the aviator's objectives. It is so arranged that the light neither blinds the aviator nor discloses him to the enemy.

The display did not go into all of the 150 or more devices being produced by the trench warfare section, some of which are new and will be first employed against the enemy. Other exhibits included grenade barrages, salvos of grenades, knapsack flame projectors and hand gas attacks.

It is said that the aviators are now

equipped with three new devices on their planes, rendering bombing considerably more effective. One of these provides a new method of aiming bombs with considerable accuracy, another measures the speed and altitude of the machine for the aviator and the third is the illuminating bomb mentioned above.

Night bombing is just becoming an efficient and effective war measure. There were no aerial bombing organizations in the allied flying corps in the first year of the war, when all planes were used for observation purposes only. To-day 25 per cent of the aerial forces are bombing squadrons with 12 machines in each.

Originally the bombing, performed by volunteer pilots, was concentrated on camps and cantonments. Only three or four bombs were carried and dropped. They were made from artillery shells and seldom reached the mark. Occasionally showers of small steel arrows were spilled. The Germans, however, commenced day bombing of cities early in 1915. The Allies in a reprisal operated their first day bombing expedition against Karlsruhe in October of the same year. Late in 1915 the French began night bombing, which was adopted by the Germans in August, 1916.

*The circular ground target used for training. The photograph shows the work of embryo bombers and the effect of the bombs on the ground*

To-day several squadrons of bombing machines go over the lines frequently and completely destroy their objectives. Unfortunately the Allies' air forces have to travel over much hostile territory defended by anti-aircraft guns to attack German cities, while the enemy can attack French cities by short flights beyond our lines. To overcome this obstacle we are developing the huge Caproni, Handley-Page and DeHaviland night bombing planes, recently announced, which will carry sufficient fuel for the long excursions and armament for protection. These bombing squadrons will be escorted by 18 fighting planes over the lines of the enemy for protection against the enemy fighting planes, after which they are left to their own devices, as the fighters do not carry sufficient fuel to accompany the bombers on the complete round trip. The bombing planes fly in a formation similar to that of the fighting planes, which is a V with the leading plane lowest and the following planes arranged in pairs on each side of the V and graduating in altitude with the last planes the highest, much like a flight of stairs. This permits the higher planes to pounce on enemy planes attacking the leaders below.

Bombing crews, comprising a pilot and a bomber, are given highly specialized training in flying, aiming, firing, navigating and fighting. This training is essential, else fliers traveling many miles over hazardous country would be likely to achieve their objective only to see the bombs dropped strike on open ground, or they might lose their route and be obliged to descend in enemy country, or again they may be met in combat by enemy planes. Consequently, they must be trained to meet all emergencies.

Shooting bombs is much like shooting a rifle. The sights and wind-gage are set, the rifle held properly and the trigger pulled.

Elemental training is given the bomber and pilot in a preliminary ground school. It includes a three months'

Three bombs just released from an airplane falling toward the objective. The bombs are still in the horizontal position, with the one above just beginning to turn its nose downward

The night bomber with plane set, bombs in place, ready for his expedition. In the lower left-hand corner can be seen bombs and rockets

course in the theory of flight, aeronautic engines, instruments and airplanes, plain and aerial navigation, astronomy, meteorology, map reading, machine guns, bombs, artillery observation and radio telegraphy. The course is so complete that many of the students are able to build workable machines after completing it. It has been prophesied that after this war the country will be overrun with homemade airplanes constructed by the present students and graduates of the military aviation course.

#### "Laying an Egg on the Hun"

"Laying an egg on the Hun," which is the term for bombing, follows the preliminary training when the graduates who stood highest are permitted to volunteer as bombers. They go to a bombing school, while the bombing pilots are sent to primary flying fields. The bombers thus advance more rapidly than the pilots, as they, at the bombing school, meet pilots already trained with whom they will work. The pilots and the bombers are urged to cultivate each other to form congenial teams, adding efficiency in this way, since from this time on the team mates work and sometimes die together. In the preparatory bombing stage, the bombing crews fly over a course over camera obscuras and Batchelor mirrors located in houses on the ground. The houses are open to the sky and the course of the planes flying is thus checked and traced on charts and show the smallest errors of the fliers.

Bomb dropping instruction follows, first from low altitudes, 3,000 to 4,000 feet, and then from higher points, 10,000 to 12,000 feet, as the aim of the bomber improves.

The target is usually a circle 25 feet in radius, painted on the ground, not hard to hit with a rifle at the distance but exceedingly difficult to strike from an airplane moving at 100 m.p.h. and far from steady. Well-trained bombers can score 7 hits out of 10 shots, while some of the best marksmen do even better.

After the marksmanship test is concluded the bombers usually fly to 10,000 feet altitude, at which height they are comparatively safe from anti-aircraft shots. Even at 4,000 feet the German batteries score 1 hit for 10,000 shells. At 10,000 feet they average less than 1 hit to every 50,000 shots.

BRITISH iron and steel manufacturers have agreed to form a national council on trade policy, which will be representative of all the ironmakers of the country, and probably of labor interests as well. It will deal with trade matters only, and will not concern itself with technical questions.

# The Labor Problem and Export Trade After the War

Foreign Business Begins at Home—Labor Turnover, Wages and Manufacturing Costs and Efficiency Are the Factors to Be Considered First

By Edward N. Hurley

*Chairman United States Shipping Board*

WITH something like 25,000,000 tons of merchant shipping to be employed inside of two years, it is none too early to look around for cargoes, both in this country and abroad. So, amid all his splendid effort in producing equipment to win the war, the American manufacturer must be asked to take thought for to-morrow and think in terms of shipping and foreign trade. This might appear like a distraction now—something which will take the attention from the supreme duty of winning the war. But, far from being a distraction, it fits in with war production and war psychology. While our factories and factory employees are building war material to-day, they are also building foreign trade, if we can only see things whole and make one factor work with another.

When the business man turns his attention to export trade he looks abroad and thinks of foreign customers. But foreign trade actually begins in his own factory. He looks abroad and studies such factors as ocean freights, foreign exchange, export packing and international salesmanship. If he would look into his own factory first, and study factors close at hand, such as labor turnover, wages, manufacturing costs and efficiency, he would be laying solid foundations for export trade.

With the bugaboo of cheap foreign labor haunting us in former years, we got into the way of thinking that export trade necessitated some lowering of wages and American living standards. Probably that was crooked thinking before the war. Certainly it is crooked thinking now, for the war is bringing other nations closer to our American standards of wages and living.

True development of foreign trade in our factories means better and better American standards.

In most of the countries of the world there will be a decided shortage of labor after the war. That country will best succeed which protects its workmen by improving their living conditions, guaranteeing a fair return for labor, protecting workmen and their families against accidents and idleness, and making workers better citizens. The country taking those measures will be the country that develops and makes products most economically, and will perform a world service by making goods at the prices fair to other nations.

In the Army and the Navy we have a visible mobilization of man power for results in a foreign country. If we could have the same visible mobilization of man power in our factories for foreign trade it would be a splendid object lesson for those who manage the factories and make the export goods.

## Cheap Labor Will Not Win Export Trade

To think of cheapness in connection with foreign trade is just as wrong as trying to pin bargain tags on soldiers. Foreign markets are not going to be won or held by cheapened American workers, or bargain methods in American life. As manufacturers we have got to lay the foundations for foreign trade by going out into our factories and studying labor and costs together. We can sell our export products at reasonable prices by increasing wages along with output, and decreasing the losses caused by labor turnover, untrained workers, spoiled materials and other inefficiency.

Our experience along these lines in the Emergency Fleet Corporation has been most encouraging. With the task of

creating new shipyards in a few months, and manning them with several hundred thousand workmen, most of whom came from other trades, we ran into about every difficulty, and problem, and tangle that could conceivably arise in management. On a large scale we effected an adjustment of man power such as is called for now in preparing the average American factory for the export trade which we will need to keep our ships employed.

To get production at unheard-of speed and in record-breaking quantity, we did something simple and fundamental—and thoroughly human. This was nothing more nor less than arranging wages so that, while our workers produced more for us, they were also able to produce more for themselves. We established the rule that a piecework wage rate set by any shipbuilder must stay in force during the period of the war. Any manufacturer who sets a piecework rate, and then reduces that rate if he finds that he has made a mistake against himself, is doing a great injustice to his employees. Profiting by our experience in the shipyards, I should like to see Congress pass a Federal law making it compulsory to keep every piece rate in effect one year. That would protect workers and furnish a real basis for increased production.

## A Lesson from the Shipyards

We found ourselves confronted with enormous losses and dangerous delays through lack of skill in special trades needed by workers in the shipyards, and also through the cost of labor turnover. To find 100 capable shipbuilders who would stick on the job it was necessary to hire and try, discharge or lose 1000. Every manufacturer will recognize in these difficulties exactly the difficulties that he himself faces from day to day, and which put excessive burdens of cost upon his products. In the shipyards we got around those difficulties by establishing training centers for the various trades we needed, and also by appealing to the splendid spirit which lies in the average worker. We had to train everybody, from the boy who heats rivets right up—foremen and superintendents, and even executives. Starting with a little nucleus of skilled riveters, caulkers, reamers, carpenters and so forth, we took them out of the shipyard for a time and taught them how to teach their trades to others. Then they went back into the yards to teach green recruits, not in any school or class, but on actual ships, while doing the regular day's work. Under this system it was possible to quickly bring green gangs up to about 80 per cent of the efficiency of skilled workmen.

As fast as these men learned their trades and acquired high earning power under our protected piece rates, they became steady enough, and the costly item of labor turnover began to drop. After that nothing more was needed but the appeal for patriotic service. We found that the shipworkers would not only stick on the job like soldiers, but that in their inherent spirit as fighters and loyal Americans there was an enormous reserve of man power to draw upon—a reserve capable of meeting every demand and every emergency, with power to spare.

That reserve of spirit exists in every American industry. War has brought it to light where executives can see it, and to develop this great reserve for foreign trade is distinctly the executive's job.

# Training Girls for the Drafting Room

Making Tracers by Intensive Methods to Meet the Demands of the Day—  
A High Degree of Skill Acquired in 4 to 6 Weeks' Course

FOR many years the Westinghouse Electric & Manufacturing Company has gone extensively into the training of employees. Educational courses in practical shop work have been conducted on an elaborate scale in the company's various manufacturing plants as well as in special night schools. The production of tracers, draftsmen, pattern makers, foundry men, machinists, tool makers, electricians, and other classes of skilled workmen has been as much a part of the company's regular business as has the making of electrical equipment.

In September, 1917, the class conducted by the educational department for instructing boys in tracing was opened also to girls. The class had originally been operated on a part-time basis, the boys receiving 4 hr. instruction a week, while still attending to their regular duties in the offices or works. In addition to this instruction the class is now operated full time for the intensive instruction of girls. Practice is given in lettering and tracing, with some instructions in drawing.

The girls who are selected for this intensive training have had at least two years of high school education. The instruction covers from 4 to 6 weeks, during a part of which time the student makes actual working tracings.

Thirty-two girls have taken this training course and have been placed in regular tracing positions. Several of these girls have qualified for more advanced work and are receiving 4 hr. per day instruction in detailing.

On the first of this month a special section of the department for training machine tool operatives was opened for women. This training section is equipped with standard machine tools and the girls will be instructed in the lighter kinds of standard work.

The methods adopted by the Westinghouse educational department for converting raw material in the form of inexperienced young men into finished draftsmen are the following: Beginners are first placed in the drafting room as tracers. If aptitude for the work is shown, an opportunity is given them to prepare for more advanced work in the department.

This preparation consists of experience in the shops on pattern making, foundry and machine shop work, and systematic training in the drafting office on the various phases of the work. Six hours per week are spent in the special training section conducted in the Educational Department. This instruction covers design problems involving various applications of mathematics, physics, mechanics, materials, shop methods, estimating and cost calculating and tool design.

A class of girls receiving intensive training in tracing in the educational department of the Westinghouse Electric & Mfg. Co. Several of the girls so trained have qualified for advanced drafting work

# Products of the Royal Aircraft Factory

Models of Planes Developed at the Establishment of the British Government—  
Further Development Work Left to Private Concerns

**S**INCE 1912 the British Government has operated works for the production of military airplanes in competition with private concerns. Innumerable types of machines have issued from these works, some successful, but more rather deficient in comparison with contemporaneous designs by private builders. Recently the R. A. F., as it is known, has been reorganized into the Royal Aircraft Establishment, and *The Aeroplane* takes advantage of the occasion to review the development work done at the R. A. F. and, with the permission of the Air Ministry, to publish photos of many of the models turned out by it in the course of time.

• The nucleus of R. A. F. was the Balloon Company, R. E., of

*The original R. E. built for speed early in 1914 with 70-hp. Renault engine*

Farnborough, which controlled all the aerostatic appliances of the British Army and came into being during the first years of the present century. A few years later, when the British Army acquired its first dirigibles, the balloon company was placed in charge of this equipment also. The original establishment and the original name both became inadequate, so additional sheds, etc., were built, and the name was changed first to the Army Aircraft Factory and later on to the Royal Aircraft Factory. Control was placed in civilian hands, and Mervyn O'Gorman was appointed superintendent. Experiments were made both with privately designed aero-

*B. E. 2c biplane with 70-hp. Renault engine*

planes and with machines developed at the R. A. F., but it was only in 1912 that a machine was produced at the R. A. F. which would really fly. In the summer of 1912 a tractor biplane with a four-bladed propeller, a two-seater, was produced which flew in the British military airplane competition, without competing, however. The machine made quite a respectable showing, as it beat all of the competitors with the exception of that of the late S. F. Cody, whose large machine

*B. E. 2d biplane with planes of equal span and ailerons operated by cable*

was ahead of the times in the matter of engine power. This R. A. F. tractor biplane, which was designed by Geoffrey de Havilland, now chief designer of the Aircraft Manufacturing Company, Ltd., probably compared favorably with anything produced up to that time. It was designated the B. E. biplane, which stood for Bleriot Experimental, because Louis Bleriot was officially regarded as having originated the tractor type of aeroplane. It was a sort of composite design,

*B. E. 2d biplane with 90-hp. R. A. F. engine*

embodying features of the Bleriot, Wright, Deperdussin, Nieuport and Avro.

During the next two years the B. E. biplane was produced in a number of variations, the most noteworthy being the B. E. 2b and the B. E. h, the latter with a Gnome engine inside a coal scuttle cowl. Shortly before the outbreak of the war there arose a craze for inherent stability, and the first B. E. 2b was evolved, in which this feature was aimed at. This differed from the original B. E. machine in that the

*Side view of B. E. 3, which is very similar to B. E. 4 and B. E. 8*

*Front view of B. E. 2c biplane with 90-hp. R. A. F. engine*

wings had considerable dihedral, and the warp control had been replaced by double-acting ailerons. An enormous tail, more or less rectangular in shape, and a big fin in front of the rudder, combined with proper weight distribution, made the machine perfectly stable, although her lift was not all that might have been desired.

Later models were equipped with more powerful engines built by the R. A. F. These included the B. E. 2d, B. E. 2e and B. E. x. The first B. E. 2 had a 70-hp. Renault engine and a single open cockpit for the pilot and gunner. The B. E. 2b had separate cockpits and a better streamline fuselage. The B. E. 2b was the first machine designed for inherent stability, and it also had a marked forward stagger to the upper plane. The B. E. 2d was similar, but had a faster wing section. In this type the under-carriage skids were

*Three-quarter front view of B. E. 2e biplane with 90-hp. R. A. F. engine*

abolished, the exhaust pipes were carried up over the upper planes and the machine generally was streamlined down to get increased speed. Most machines of this type were equipped with a 90-hp. R. A. F. engine instead of a 70-hp. Renault.

A marked change was made in the B. E. 2e type, which had a single pair of inter-plane struts outside the center section of the wings, and a big overhang to the upper planes, in which overhang the ailerons were connected by a slender tubular strut to the small lower ailerons, this strut being outside the line of the inter-plane struts. This machine also was designed to give more lift than its immediate predecessor, but its power plant and fuselage were practically the same. In all of these machines the passengers sat in front of the pilot.

*R. E. 8 biplane with 130-hp. R. A. F. engine*

Some months before the outbreak of the war a need was felt for faster and larger types of aeroplanes, and the R. E. (Reconnaissance Experimental) was produced. The first of this type was a modified B. E. with a single pair of struts outside the center section on each side. This was equipped with a Renault engine of 70 hp. It was fast, but did not have much lift. A subsequent type, the R. E. 4, which was fitted with an Austro-Daimler engine of 120 hp., had good climbing ability and, piloted by Norman Spratt, easily beat the existing height record. It was a very slightly machine, but is believed to have involved some aerodynamic defects. Later developments of this type included the R. E. 5, R. E. 7 and R. E. 8, these being used as self-protecting artillery observation machines, night bombers and contact patrol machines. They were fitted with 12-cylinder R. A. F. engines of about 130 hp.

*Three-quarter front view of R. E. 8 biplane with 130-hp. R. A. F. engine*

For a period in 1916-17 they were very unpopular, but subsequent changes in design made them both pleasanter and safer. By this time, however, they were already becoming obsolescent.

The first aeroplanes fitted with machine guns were of the pusher type. Machines of this type manufactured by the R. A. F. were known as type F. E., which letters indicate Farman Experimental. These machines were rather queer looking, and the second type brought out is described as "a bull-nosed brute with a deep nacelle, at the rear of which was a 70-hp. Renault engine driving the typical R. A. F. four-bladed propeller." The Bleriot shaped, Wright braced warping, B. E. type planes were retained, as was also the B. E. type pear-shaped rudder hitched to Farman type tail booms. The machine was inclined to spin, and it was not long before an accident occurred in which the passenger was

*R. E. 4 with 120-hp. Austro-Daimler engine which established a new altitude record*

killed and the pilot crippled. Later examples, fitted with rigid wings, ailerons and Beardmore engines were more satisfactory in their performance and were largely used at the Front, first for fighting, and second for night bombing. The official significance of their name has changed from Farman Experimental to Fighting Experimental. Colloquially they became known as Feeplanes.

A single-seater pusher fighter with a Gnome engine, on the lines of the de Havilland 2, and known as the S. E. 8, gave quite a creditable performance. Another model, known as the S. E. 2b, was developed, and the very first example of this type to cross the Channel landed behind the German lines and was captured without being seriously damaged.

Next the R. A. F. attacked the problem of the fast single-seater and produced the F. E. (Fighting Experimental) type.

*F. E. 2b biplane with 120-hp. Beardmore engine and trip wheel under carriage*

In the F. E. 2 a special attempt was made to reduce the head-on resistance, only a single pair of struts being used between the wings and a round, tapering fuselage. Driven by a 160-hp. Gnome, with 24 cylinders, this small machine exhibited great speed, but otherwise its performance was poor, and it was almost impossible to control. The type of engine was also very unreliable.

*Three-quarter rear view of S. E., showing position of Lewis gun on top plane*

An improved design, the F. E. 5, with Hispano-Suiza engine, showed a better all-around performance. In this type, stability was developed to such a degree as to be a fault, for the machine was difficult to maneuver rapidly in air fighting. This gave the advantage to especially controllable enemy aeroplanes in that they could hold their own by keeping on fighting inside the F. E.

## The New Giant German Airplane

THE French aviation authorities recently announced officially that during the night of June 1-2 a giant enemy airplane provided with four motors and carrying a crew of eight men had been brought down near Nanteuil-le-Haudoin—about half way between Soissons and Paris. Further particulars concerning this machine have been supplied by a correspondent on the French front. The machine is stated to be of the "Lizenz" model, but we accept this name with reserve, as it is merely the German word for "license." The following numerical data are furnished by the correspondent:

Engines	four of 300 horse-power.
Span of wings	141 ft.
Length overall	92 ft.
Weight, empty	20,300 lb.
Weight, fully loaded	32,200 lb.
Weight of bombs carried	4,400 lb.
Maximum speed	75 to 80 miles per hour.
Armament	four machine guns.

The crew of eight apparently consisted of the pilot, an assistant pilot, two gunners and four mechanics.

It is of some interest to analyze these data as far as we are able, and to compare this new type of machine with the Gotha or Friedrichshafen bombing machines, the largest machines of which, hitherto, we have had definite information. We can assume, we think, that the engines are of the Mercedes 260-horsepower six-cylinder design, for it seems unlikely that the enemy has developed a new type of engine and applied it to a new type of airplane. The Mercedes engine of the model named consumes fuel and oil combined at the rate of 146 lb. per hour at normal speed. The crew can be reckoned at 180 lb. per head. The Friedrichshafen machine is provided with tank capacity sufficient for about 3¼ hours of flight at full speed, and usually carries a crew of three, although accommodation is provided for four. With these figures we get the following comparison of weights:

	Friedrichshafen.	"Lizenz."
	lb.	lb.
Weight, empty	5929	20,300
Fuel oil for 3¼ hours	948	1,896
Crew	540	1,440
Bombs	1229	8,564
Total weight	8646	32,200

It will be noticed that the weight of bombs carried by the new machine, according to this reckoning, is nearly twice as great as the figure named in the unofficial account. If the latter figure is correct, it would seem that the machine is provided with sufficient fuel and oil capacity for some 5½ hours' flight at full speed. It would thus appear to be capable of carrying nearly two tons of bombs to a point some 200

miles from its base and returning. The German airdromes in West Flanders are about 140 miles from the center of London, as the crow flies. Hence the new machine has been designed, it might be presumed, not to bring new regions within the range of airplane attack, but, primarily, to enable bombs of greatly increased weight to be dropped on the targets already reached by the Gotha and Friedrichshafen.

We do not know what the speed of the Gotha is, but it is obvious that it must, in order that the machine may be able to bomb London and return within three hours, be at least 100 miles per hour. It will be seen, therefore, that by doubling the power and by being content with a materially lower speed the enemy has nearly quadrupled, in the new machine, the weight of bombs carried. To obtain the increased lift it is not, of course, sufficient merely to increase the power; the size of the machine, as a whole, must also be increased. The span of 141 ft. in the new machine compares with 78 ft. in the Friedrichshafen, and the overall length of 92 ft. with 42 ft. Thus the actual area of the target presented by the machine is approximately four times as great as in the case of the Friedrichshafen. This figure has, further, to be multiplied by some factor greater than unity, in order to allow for the effect which the reduction of the speed has on the probability of successful attack by gunfire.—*The Engineer.*

### Gile Engine Employs Sub-Piston

(Continued from page 229)

From this point on, the two pistons travel in a downward direction together and the cycle is then repeated.

It is claimed for the Gile engine that it burns kerosene as readily as gasoline. This is explained on the theory that the fuel particles are thoroughly broken up in being passed through the small flutes in the cylinder walls. No preheating of the fuel or air is required. It is stated that observation and chemical analysis of the exhaust gases show substantially complete combustion of kerosene as well as of gasoline.

The exhaust valve is located centrally in the head and is operated by means of a cam through a mushroom type cam follower, a tappet rod extending up the side of the cylinder, and a tappet lever. Another peculiarity of the engine design is that the exhaust manifold, which is of square cross section, runs alongside the cylinder block, being cast integral with the cylinder casting and completely surrounded by the water-jacket.

# British Post-War Industrial Plans

## Committee for Engineering Trades Makes Report Containing Recommendations as to Methods to Be Pursued During the Reconstruction Period and Later

**I**N Great Britain the term "engineering" has a somewhat different meaning from that usually given it in this country. What is referred to as the engineering trade is what we in this country would call the mechanical industries or machinery manufacturing industries. A report has recently been made by a departmental committee of the British Government dealing with the prospects and requirements of the British engineering trade after the war. This contains a number of recommendations which should prove of interest to American manufacturers. One of the measures requested of the Government is a total prohibition of imports of engineering material from present enemy countries for a period of at least one year from the time peace is concluded. Exceptions might be made in special cases where imports are advisable in the national interest, and in such cases importation is to be made under Board of Trade license.

### Difficulties of Controlled Firms

In the opinion of the committee, the firms controlled by the Government are entitled to special consideration. Most of them are engaged on work for which there will be no demand in peace times, and the change-over from war work to peace work will entail great difficulties. Labor difficulties, it is believed, will be more accentuated than in uncontrolled plants. The knowledge that work is being done without competition for the Government has produced a feeling among workmen—and indeed among the staff—that inasmuch as the Government pays, the rates of wages can be indefinitely increased and that no particular attention need be paid to cost. In the necessary pressure to produce work urgently required many concessions have been made in the matter of wages, with the consent of the authorities, which would be impossible in normal working. The controlled firms, when the control is lifted, will have the greatest difficulty in reorganizing their payrolls along anything like normal working lines.

In view of these and various other difficulties pointed out it is urged that the controlled firms have their works returned to them unimpaired as to capacity, and that the many and great difficulties which will confront them on their return to normal trade, both as to obtaining orders and reorganizing their works, should be regarded generously by the Minister of Munitions under the powers entrusted to him.

### Japanese and Canadian Competition

Considerable competition is expected from the engineering trades of Canada and Japan and the report has the following on this subject:

"As a matter very relevant to the considerations of international competition after the war, it is necessary to refer to the great growth of engineering works in Canada since 1914. We have no details, but report says that with a population of eight millions Canada is now equipped with engineering works capable of dealing with

the wants of twenty-four millions of people. If this is true, the competition of Canada may hereafter have to be included in any reckoning of international trade.

"It is not only Canada which promises a large competing output in the future. No engineer can afford to ignore the signs of rising competition from Japan. Intelligence, enterprise and cheap labor combined may easily make Japan a formidable competitor, in spite of her relative lack of coal and ironstone. As yet there are signs only, but to these we think it necessary to draw attention."

### Raw Materials

British manufacturers are comparatively well situated with respect to raw materials, but structural engineering firms have at times bought some of their girders and sections and locomotive and car builders their axles and tires from German and Belgian firms. Some of these fear the effect upon their export business if import of raw materials and parts were forbidden.

Some interesting remarks are made in the report regarding trade organization. Undoubtedly, a considerable step has been taken in Great Britain in the direction of working in larger units—not necessarily in the nature of actual amalgamation of firms, but by subdivision of production. So far, no practical steps seem to have been taken by any engineering association, with one exception, toward perpetuating the improvement which is now existing; but the recognition of the faulty system of the past is general and finds expression in conferences and resolutions. The desire for improvement in the future is very evident, and it does not seem beyond the capacity of the abilities of ordinary business men to come to some arrangement which may in the future improve production and eliminate waste. Where amalgamation may not be possible, it seems that firms should in many cases be able to pool their resources.

### Large vs. Small Establishments

The chief bar to the attainment of this most desirable result is a characteristic at once admirable and obstructive. While in Germany independence does not appear to be the leading characteristic of the manufacturer, in Great Britain the manufacturer's strong individualism imparts to him the desire to stand alone, to make or mar his own fortunes, to be beholden to nobody, and to be controlled by no one. In this he has been supported by the public, who think the assembled article lacks the guarantee of the manufacturer. It was undoubtedly the multiplicity of small manufacturers closely applying themselves to their trade in the past which produced the engineering trade as it exists in Great Britain to-day. Conditions have, however, changed, and the progress and maintenance of the engineering trade in future depend a good deal upon production upon a large scale, with the minimum of standing charges and of waste. Under the head of preventable waste must be included the waste of effort involved in restriction of output by workmen.

In the view of the committee, however, despite the tendency toward larger units, the small manufacturer will continue to exist. He may not have before him much hope of large profit, but he undoubtedly has great uses in his readiness to adopt and try new things—in the application of his inventive genius, and in the practical knowledge that he himself acquires through actually working in his own shops and in daily contact with his own men. Many of the men at the head of great works to-day, in the capacity of directors, have only a theoretic knowledge of the works they direct as compared with the practical knowledge which their fathers and grandfathers had before them.

#### Decimal English System Recommended

The committee recognizes the advantages of a decimal system, but makes only a very slight concession to the champions of the metric system. It is held to be desirable that the division of the inch into one-eighth, one-thirty-second and one-sixty-fourth should be abandoned altogether in favor of the division into hundredths, which is already used exclusively for high-class work; it would not be necessary to vary the higher measures, as, with the occasional exception of the foot, they are not much used for precise measurements.

The hundredweight and ton should be replaced by the cental and short tons of 100 and 2000 lb. respectively, the latter in conformity with American practice. The change would simplify invoicing and freight charges, and would be less mystifying to the foreigner.

The statement is made by the committee that it would approve of a similar change in coinage if it were within their terms of reference and provided that the pound sterling were retained as the unit of value for all purposes. They do not consider the dollar a suitable unit. The absurdity of such a complication as 73 tons 13 cwt. 3 qrs. 17 lbs. at £11 17s. 6d. a ton is obvious, and a great saving of time would result both in work and in education by the adoption of decimal notation in connection with the present English bases of measures and coinage.

An interchange of opportunities between factories and universities is advocated. The university work might be greatly assisted by facilities for its students to carry on practical work in workshops while pursuing their university career, so that, as far as possible, the university education might be joined up with practical experience, as is indeed done to a great extent in Scotland and to some extent in England. It is of the utmost importance that university authorities should keep in the closest possible touch with the manufacturers if the full benefit of university education is to be obtained, and for this purpose lectures on technical subjects, and luncheon clubs arranged at which the university authorities and manufacturers meet fortnightly have proved to be most valuable.

#### Stricter Enforcement of Patents Act Working Clause

It is held that the object of the British Patents Act has been frustrated in many cases by foreigners applying for British patents not with the purpose of working these patents in Great Britain but for the purpose of securing a monopoly of the British market for goods manufactured abroad by owners of British patents. It is suggested that that part of the Patents Act which requires manufacture within Great Britain should be more stringently enforced, and should refer not merely to nominal manufacture or to the assembling of parts made abroad, but to actual manufacture of commercial quantities. In the view of the committee manufacture in Great Britain would be best attained if it were possible to define a proportion of the articles to be manufactured

under the patent in that country as against the total import of such article under patents held abroad.

The subject of licenses and royalties is also referred to and the thought is expressed that the clauses of the Patents Act requiring licenses to be granted might be materially improved by providing some competent body to decide as to the reasonableness of the royalties and of the terms demanded for the grant of such licenses without the expense involved in a reference to the court. At present the fixing of such royalty depends practically upon bargain with the patentee. If he is desirous of preventing any manufacture under license, the terms he may demand will necessarily choke off the intending licensee, who will be reluctant to institute proceedings to get a reasonable rate fixed. The obligation to grant licenses is only enforceable if it can be proved that the patentee has not in fact manufactured in this country. This condition is almost prohibitive so far as the intending licensee is concerned. It is suggested that the onus of proving that he has manufactured in Great Britain within the terms of the act should be thrown upon the patentee.

Finally, the report refers to trade prospects after the war. The belief is expressed that for a short time after peace is declared the need for engineering products will be so urgent that prices will be maintained at an abnormally high level till the most pressing demands are satisfied.

#### General Decrease in Purchasing Power

Reference is also made to reconstruction work in the devastated sections of France and Belgium, and British manufacturers are believed to be ready to allocate a definite proportion of their output to orders for this purpose. It appears to the committee that the purchasing power of the whole world, outside the United States and Japan, will be much diminished, and that the ability to satisfy needs will depend upon ample supplies of raw materials and of engineering products at reasonable prices. Says the committee: "The United States will certainly make a considerable attempt to meet these demands, but the high cost of production there prevailing should enable British manufacturers at anything like normal prices to meet that competition in neutral countries with fair hopes of success."

#### Book Review

**STEAM Road Vehicles**, by L. M. Meyrick-Jones. Published by Iliffe & Sons, Ltd., London. Price, 3s. 10d.

This book is intended for the use of drivers and owners of steam trucks and tractors. In England, contrary to the conditions here, steam is a very important factor in road haulage, and its importance has even increased during the war because the fuel of the steamer, coal, is a national product, whereas gasoline and other petroleum products have to be imported.

The author is a practical engineer with long experience of steam engines and he has dealt with their application to road vehicles in a most comprehensive way, the descriptions of the working of the engine, the generation of steam and the means of transmitting the power to the road wheels being clear and concise. Apart from the engine itself, all other components and accessories are fully dealt with in separate chapters, and there is also given much useful advice on the preparation of vehicles for the road and their management while in commission. The need for frequent "shed days" is emphasized and the writer provides some valuable hints on overhauling and washing out, as well as minor repairs that the driver can undertake in the garage.

The book contains close to 200  $5\frac{1}{2}$  x 8-inch pages and is illustrated with numerous simple diagrams and some half-tone cuts. It is well indexed.

# A. C. Arc Welding and Cutting

A New System Involving the Use of a Novel Principle—No Running Machinery Required and Current Consumption Low

**E**LECTRIC arc welding, cutting and repairing are accomplished by the application of the heat produced when the electric current jumps a gap in a circuit. The temperature and amount of the heat generated at the arc can be varied to suit the melting point of nearly all metals by varying the electrical characteristic of the apparatus employed to hold the arc.

Arc welding apparatus marketed in the past employed direct current at the arc, which in the case of either an a.c. or d.c. power supply required a heavy motor generator set and an elaborate switchboard. For general welding a 10 to 15 hp. motor and an 8 to 10 kw. generator, with switchboards for both, were required, together with starting apparatus, the whole set weighing from 1 to 2 tons, and for cutting, 2 tons and upward.

The Electric Arc Cutting & Welding Co., Newark, N. J., claims to have solved the problem of holding and controlling an alternating current arc, and it has placed on the market a light weight a.c. welding machine consisting of a special transformer with no moving parts.

It is a law that the heat produced by an electric arc is proportional to the product of the volts across the arc and the amperes flowing through it, or to the wattage, and this wattage must be varied to suit different conditions of metals, electrodes and work. It is claimed for the alternating current arc machine that it automatically holds the heat of the arc substantially constant for any given setting. As soon as a person becomes accustomed to the sound and sight of the arc and can deposit the molten metal where he desires, it is said to be impossible to burn the metal from too much heat, or to make imperfectly joined, or "cold shot" welds, from too little heat. Different metals, electrodes and conditions in shops require various amounts of heat and varying temperatures, and these adjustments are obtained by an easily moved adjustment handle on the special transformer, together with taps arranged on the plugging board, the operation being similar to that of inserting a plug in a telephone switchboard.

The transformer develops an efficiency of between 80 and 90 per cent, considered as a piece of electrical apparatus. From 1½ to 2¼ kw.-hr. are required to deposit a pound of mild steel. A feature of the machine is its portability. In the largest 60 cycle type, the machine weighs about 200 lbs. Means are provided for two men to carry this apparatus to any location, set it up on a bench, or under the bench, or in any position relatively remote from the work.

## Can Be Operated from Any A. C. Circuit

The machine can be designed to operate from any-power supply. Any alternating voltage can be made use of, except that for the sake of safety it is not advisable to introduce in the shop any machine taking more than 650 volts in the primary. This lowering of the shop voltage is regular practice. The machine can be designed for single-phase, two-phase three wire, and two-phase four wire circuits, or to operate across the outside wires of a two-phase system or from a three-phase power supply. The polyphase machine is 30 per cent heavier than the single-phase machine; for welding, a power demand of from 3 to 4½ kw. is made with the polyphase machine, and for cutting, from 6 to 8 kw. There is, however, no necessity for buying a polyphase machine, which is heavier and costs more. In the case of two-phase circuits, absolutely balanced current can be drawn from each of the two phases by placing the single-phase machine across the outside wires.

The amount of copper required for the installation of this welder and cutter is comparatively small. The distribution

wiring is on the high-voltage side and requires only wires of nominal size. For instance, for a 400-volt shop, two No. 8 wires are sufficient to reach any welding location, and a simple plugging-in arrangement is used.

As regards penetrative ability, it is significant that the advent of the a.c. arc has resulted in the practical cutting of cast iron. This has always been considered an impossibility or at least impractical with other systems of cutting, as a layer of cementite would form between the weld and the original cast iron, which had a very low strength and was so hard that machining was impossible. The a.c. arc, owing to its penetration, causes a molecular penetration of from ¼ to ⅝ in. into the cast iron, distributing the weld and the cast iron so that there is no definite hard layer, except for the very outer edges, which can be ground off.

## Quality of the Weld

With certain electrodes it is possible to get ductility and elongation. While these qualities are not present to the same degree as in boiler plates, the ductility and elongation of mild steel can be equalled. With boiler plates test pieces can be welded which bend flat on themselves, the bend being in the weld, and which in the twisting test will twist two complete revolutions before tearing.

The machine can be made for either cutting or welding or both functions can be combined in one machine. It can be designed to use any make of electrode—bare wire, slag covered electrodes, gaseous fluxed electrodes, or carbon electrodes.

Among the uses to which the machine can be put are various operations in automobile construction and repair. An example of its use in automobile construction is the welding of the complete rear axle housing together with the axle tubes, these parts being put together without the use of rivets. A repair job to which the machine is applicable is the welding up of a cracked cylinder, and this should be done without stopping the engine running. The water up to the line of the leak is required to distribute local heat strains in welding, and this water should preferably be hot, so that the temperature difference between the arc and the water will not be so great, hence the advisability of keeping the engine running.

# Karry-Lode Industrial Trucks, Tractors and Trailers

Built to S. A. E. Standards Throughout—Employ Roller Pinion Type Internal Gear Drive and Are Provided with an Automatic Safety Switch

**T**HE Karry-Lode Industrial Truck Co., Long Island City, N. Y., has placed on the market a line of industrial trucks, tractors and trailers of the electric type for use on steamship piers, in railway yards and in industrial plants. Their line comprises one size of tractor developing a drawbar pull of 600 lb.; two platform trucks, one with a 60-in. wheelbase and 96 x 45-in. loading platform, and the other with an 80-in. wheelbase and a 116 x 45-in. loading platform; also a compensation crane truck, with a crane fitting into the standard freight car and having 180-degree swing, and a steel trailer with a 36 x 72-in. platform.

Before the design of the Karry-Lode line of industrial trucks and tractors was taken up, a thorough study was made of all machines of this type on the market at that time. Special attention was given to the requirements of strength, flexibility, simplicity, accessibility and reliability. The electric motor used on all models is of  $3\frac{1}{2}$  hp. capacity and is of a type specially designed for industrial trucks. It forms a unit with the entire electrical system, which makes for convenience in repair and overhauling. The frame is built up of 4-in. channel beam, the side members being securely tied together by cross members of ample section and reinforced by gusset plates. The battery box is so arranged that every cell of the battery is instantly accessible. The batteries are placed below the loading platform, where they are out of sight.

## Rear Axle of Internal Gear Type

The rear axle is of the internal gear type, the load being carried on a 2 $\frac{1}{4}$ -in. dead axle made of Shelby seamless tubing. The driving shafts are of solid nickel steel, and the wheels run on large sized Hyatt roller bearings. The front axle is also of tubular design and is provided with drop forged, heat treated steering knuckles. The wheels run on Hyatt roller bearings. Large sized steering connections are used throughout, and the joints are bushed so as to make it an easy matter to take up wear. Cast steel wheels are used, and the internal spur gear drive on the rear wheels is completely inclosed.

The Type P industrial truck has a capacity of 2 tons and a chassis weight of approximately 2200 lb. It is provided with a battery equipment of eighteen 11-plate Ironclad Exide cells, the battery alone weighing 800 lb. The motor operates

*Platform of truck swung back showing accessibility of battery*

at 30 volts and consumes a full load current at 40 amp. By means of the controller, three forward speeds and an equal number of reverse speeds are obtainable. The tread is 34 in. and 20-in. steel wheels are used with  $3\frac{1}{2}$ -in. solid rubber tires.

An external contracting brake acts on the propeller shaft. The frame is suspended on coil springs both in the front and rear. A speed range of from 1 to 7 m.p.h. is afforded and the rated mileage on level surface is 25 miles on one charge. The overall dimensions of this truck are 52 $\frac{1}{2}$  in. in width, 116 in. in length and 43 $\frac{1}{2}$  in. platform height.

There are no great differences from the above in the design of the type PL truck, which has a 116 x 45 in. loading platform and the same capacity as the Type P, namely, 2 ton. The chassis weight is 2450 lb. and it carries 20 cells instead of 18, the battery weight being 1000 lb. This machine has a wheelbase of 80 in., and its overall dimensions are as follows: Width, 52 $\frac{1}{2}$  in.; length, 136 in.; platform height, 23 $\frac{1}{2}$  in.

The battery and motor equipment of the tractor corresponds to that of the lighter of the two trucks. However, in order to make as much of the weight of the tractor as possible available for traction purposes, it is designed with three wheels, and most of the load of the battery is carried on the rear wheels. The total weight of the tractor is 2500 lb. and its wheelbase is 41 in. The tractor has a rated speed of 1 to 6 m.p.h. and a rated mileage on the level of 25 miles. Its overall dimensions are: Width, 48 in.; length, 69 $\frac{1}{2}$  in. Its drawbar pull is 600 lb.

A double reduction is obtained from the armature shaft to the rear wheels by a pair of bevel gears at the center of the rear axle and the internal gears and pinions at the wheels. The pinions meshing with the internal gears are of the roller type. They are located directly above the stationary load carrying axle. A Thermoid fabric universal joint is

inserted between the electric motor and the propeller shaft and the Bailey non-skid differential is fitted. As a safety device there is a switch which is operated by the driver's seat or footboard and in case the driver should be accidentally thrown from the truck, the latter would

*Karry-Lode industrial tractor and truck*

automatically come to a stop. Further, if the driver gets into the truck again, he will have to start it over in the usual way by first going into the low speed and passing through the intermediate into the high. It would be injurious to the battery, and to the motor as well, if the controller remained in the high speed position and the current was switched on by the automatic switch. The entire control is effected by means of two levers extending forward from a pair of pedestals secured to the frame side members. The driver stands on the front platform and controls the truck with his two hands, steering by moving one lever in a horizontal plane and starting, varying the speed and braking by moving the other lever in a vertical plane. Motors and controller are of General Electric make.

A view of the trailer chassis is shown herewith. It is of the four-wheel type, having two caster wheels at the forward end and two cast steel wheels on the axle stubs at the rear end.

The frame itself is made of angle steel, reinforced by gusset plates at the corners, and sockets for stakes are riveted to the inside of the frame members. The trailers can be very quickly hooked together, and unhooked, and in some places women have been employed for this work. Women are also used for driving the trucks and tractors.

Karry-Lode trailer with platform and stakes removed

## Official Test of Tire Pumps

A TEST has been made at the testing laboratory of the Automobile Club of America, New York, of the Cassco power tire pump, manufactured by the West Side Foundry Co., Troy, N. Y., and sold by the Edward A. Cassidy Co., New York City. The test bore mainly on the time required for inflating different sized tires to certain definite pressures, and on the power required for operating the pump.

The Cassco pump has a single cylinder. Cylinder and crank case are of cast iron. The three pumps which were tested were provided with a single piston ring of cast iron. The cylinder and crank case are in two parts with a fiber gasket placed between them. The valves were of the poppet type. During the test the pumps were lubricated with 300 W transmission oil. The pumps were 2½ in. bore and had a stroke of 15/16 in.

In the test the gear and gear shaft were dispensed with. The crank shaft of the pump was directly connected to an electric dynamometer operating as a motor by means of a flexible coupling. A piece of ¼-in. copper tubing, approximately 10 ft. long, was connected between the discharge valve of the pump and an Ashcroft test gage. A three way cock was placed between the end of the tubing and the gage. A piece of rubber tubing 24 in. long was placed between the gage and the Schrader tire air inlet. The valve portion of the Schrader tire valve was removed from the metal inlet, in order to allow the full air pressure in the tire to be recorded in the gage. This necessitated the pump not only filling the tire to the required pressure but also filling the

hose and large gage to the same pressure, therefore giving the pressure in the tire as shown on the gage less than what the pump actually delivered. To overcome the pulsation of the air in the gage a stopcock which was kept partially closed was placed between the main air line and the gage. As a result the gage needle did not vibrate and a more accurate reading could be obtained.

The pressure to which the tires were inflated was 20 pounds per inch of cross-section. The speed of the pump was determined by a Veeder odometer counter and the time by a split second stop watch. The results of the test are recorded graphically in the curve sheet. The manufacturer guarantees that the pumps used in the test were taken from stock and no changes were made in their construction, except that the top of the outlet valve was shortened 1/16 of an inch on all three pumps.

The results indicate that a Cassco tire pump operated under the conditions mentioned above will be able to inflate a 30 x 3½ tire in from 43 seconds to 1 minute and 3 seconds, according to the speed at which it is driven between the limits of 823 and 1138 r.p.m. A 34 x 4 tire will require 1 minute and 20 seconds to 1 minute and 41 seconds between the speed limits of 821 and 1152 revolutions per minute. The inflation time of the third tire (36 x 4½) varied between 1 minute and 45 seconds to 2 minutes and 30 seconds when running the pump between speeds of 828 and 1165 revolutions per minute.

Horsepower determinations were made while inflating a 30 x 3½ inch tire and the power consumption was found to be 0.20 hp. at 800 r.p.m.; 0.27 hp. at 900 r.p.m.; 0.35 hp. at 1000 r.p.m. and 0.44 hp. at 1100 r.p.m. It is stated, however, that no great degree of accuracy can be claimed for these figures, as the power consumed is so small in comparison with the size of the dynamometer.

Time required to inflate tires

## Canadian Registrations

AS illustrating the ratio of increase in the registration of motor vehicles of all kinds in Ontario, the past year shows a total of 83,799 passenger and commercial cars as against 54,375 in the previous year, an increase for the 12 mos. of more than 50 per cent.

Motor cars were first licensed in Ontario in 1903, when 220 vehicles were registered. Up to and including 1917, the registration advanced to 83,799 vehicles, and Canadians prominent in automobile affairs say that despite the war and its burden the close of the present year will see the 100,000 total far exceeded. In 1903 when motor cars were first licensed in Ontario, not one was owned by a farmer. To-day the farmer car owners of Ontario number 23,409.

### HORSELESS AGE SUBSCRIBERS

Subscriptions for the Horseless Age transferred to the subscription list of AUTOMOTIVE INDUSTRIES in the merging of the two publications will be completed in full by the weekly issues of AUTOMOTIVE INDUSTRIES to the dates of expiration shown on the records of the Horseless Age Co.

Owned by United Publishers Corporation, Address 243 West 39th St., New York; H. M. Swetland, President; Charles G. Phillips, Vice-President; W. H. Taylor, Treasurer; A. C. Pearson, Secretary.

Entered as second-class matter Jan. 2, 1903, at the post-office at New York, New York, under the Act of March 3, 1879.

Member of the Audit Bureau of Circulations.

Automotive Industries-The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

## Super-Induction and Variable Pitch Propellers

VARIOUS suggestions have been made to overcome the effect of the loss of power of an aircraft engine at high altitudes, especially on the lift of the machine. It is mainly to secure a means of counteracting this effect that the Aircraft Board is looking for a variable pitch propeller. The production of such a propeller obviously involves serious mechanical difficulties, and it is doubtful whether these could be eliminated during the period of war.

What is desired chiefly in high altitudes is increased lift. The drift or propulsive effort in the direction of flight, of course, is reduced in the same proportion, but inasmuch as the air resistance also decreases with the density of the atmosphere this does not affect the speed of the plane.

It has been suggested that the loss of lift with increase in altitude could be overcome by using super-induction, employing perhaps an automa-

tic arrangement whereby the pressure at the carburetor inlet could be maintained substantially constant. This alone, however, would not solve the problem, for if the propeller were designed to absorb the maximum power of the engine at the speed corresponding to that power and when operating in air at normal atmospheric density, at an altitude of 20,000 ft., where the atmospheric pressure is down about 50 per cent, it would absorb only 50 per cent of the engine power. The result would be that the engine would increase in speed until its power output would equal the increasing power absorption of the propeller. Inasmuch as the power absorption of a propeller varies as the cube of its speed, there would not be such a very great difference between engine speed near the earth and engine speed at 20,000 ft. altitude. But if the engine and propeller are to be operated near their maximum safe speed in low altitudes, for the sake of maximum plane speed this increase in engine speed of high altitudes is not permissible.

Consequently super-induction will not obviate the need for a variable pitch propeller, but combined with such a propeller it promises to give results in respect to plane speed and lift at high altitudes which are not obtainable with present constructions.

## Some Things That Have Hurt

WITHIN the recollection even of some of the newcomers into the ranks of the automobile industry there was staged with much pseudo-pomp and more press-agenting at a national show in Grand Central Palace, New York, a champagne-christening of a highly colored and gaudily decorated representative model of a new make of automobile. This display of bad taste and worse business judgment did not, of course, indicate, except by contrast, the standards of the more substantial and conservative portion of the industry. But it affected every one in the industry to an extent which it is hard to measure.

It was, it is true, an exceptionally aggravated case of misconceived and badly directed advertising effort; but, unfortunately, it was not so much of an exception or so radically different from the general selling methods of the day as it might well have been. And it can also be truly said that in a milder form and in varying extent this same disease has been more or less prevalent among us from year to year.

At all recent shows we have seen too much of the nickel-plated chassis trimmed with satin ribbons, and the silver-plated car with black and yellow striped upholstery made, according to the exhibiting company's ambitious publicity manager, to the special order of some well-known moving picture star or the wasteful daughter of a thrifty millionaire not long deceased.

We have had too many "society days," with doubled prices of admission and their resulting umns of newspaper comment on the attendance and purchase of cars by those whose chief claim to fame lies in the fact that their names are to be in the social register.

Our show decorations have been too elaborate. There has been too much of the theatrical in our show methods and show advertising. The automobile industry is paying for it all now.

We thought it was good salesmanship, modern merchandising and, to be perfectly fair, if the world had not gone to war we should probably still think so. It has developed, however, that many of these things, of which we all approved at the time, have actually worked an injury upon us which, when the real merits of the automobile are considered, is wholly undeserved.

There is evidence to be had from many sources

that our future shows are to be very different in certain ways from those of past years. It has been suggested that we start to reform by calling them expositions, which they are, instead of shows, which they are not. It is a good beginning. Let us modify our decorative schemes. Let us exclude the gaudy, freakish cars and exhibit the chassis as they are in real life. Let us make our expositions business shows, and emphasize utility and practical value without slopping over in trying to do so. We can't fix up the past—it has many times been given up as a hopeless job—but we can build on more solid ground as we build for the future.

## Lessons Learned from a 100-Hour Tractor Test

ONE of the most interesting and instructive features of the attempted 100-hour non-stop test of the Parrett tractor at Salina, Kan., was the demonstration which it afforded of the feasibility of night plowing. Equipped with two powerful acetylene headlights, the tractor worked at night with the same ease as in the day. A great deal of interest was manifested in this night work and it is to be regretted that the official report does not contain a special record of the fuel consumption as compared with that of the daylight operation. It would also be instructive to compare the plowing speed at night with the daytime speed.

The ability to work at night is one of the most valuable features of the tractor. It not only increases the farmer's working day but enables him, in certain localities when the heat of mid-day is oppressive, to do his plowing at a time when both he and the machine can work more efficiently.

It seems likely that when the next tractor demonstration takes place, there will be many non-engine-stop plowing tests. They seem to be more convincing to the farmer than any other sort of demonstration. Many dealers handling tractors have been

asked by farmer prospective purchasers to give them a 10-hour continuous plowing demonstration. They are apparently convinced that if the tractor will work successfully during so long a period it will meet all of their requirements.

The test of the Parrett tractor would have been made more valuable if those conducting it had taken account of the kerosene consumption during the 13 hours and 28 min. when the engine was running idle at 360 r.p.m.

The average of 2.4 m.p.h. for 80 hours made by the Parrett tractor in the test is quite remarkable, but even this does not, in all probability, represent what the average performance is likely to be soon.

It seems reasonable to expect that speeds of from 3 to 3½ m.p.h. for similar periods will be demonstrated within the next year. Speeds as high as this were made with good economy and good plowing in the fuel economy test which formed a part of the demonstrations at Salina.

Everything seems to indicate that with redesigned plows, it will be possible to do as good or better work at double and perhaps three times the speed with tractors as is now done with horses.

## Motor-Propelled Cultivators

PRACTICALLY none of our present agricultural tractors are adapted for operating cultivators for cultivating corn and similar crops. As cultivation is of equal importance to plowing, and as a farmer cannot dispense with his horses unless he can cultivate as well as plow with his tractor, it is rather remarkable that no more attention has been paid to the motor cultivator. In one respect there is more need for substituting motor power for horse power in cultivating than in plowing, because most of the former has to be done in midsummer when horses suffer greatly from the heat.

Probably the proneness of people to follow the path of least resistance furnishes the explanation why so many engineers have developed plowing tractors and so few motor cultivators, for the design of a practical cultivator involves some decidedly knotty problems. The tractor must afford sufficient ground clearance midway between its wheels so as to be able to straddle the row without injuring

it at the last plowing. As the cultivator requires comparatively little draft, the tractor must be made light, else more power will be required to move the tractor itself than to pull the cultivator, and the efficiency will be low. Where so little power is required it seems hardly warranted to employ four cylinders in the engine, but with a smaller number it is difficult to secure a tolerable degree of balance.

In order to prevent covering up the small plants at the first plowing the driver must hold the handles of the cultivator, and therefore must ride behind it. This would point to a two-wheeled tractor with a two-wheeled sulky attached behind as the most logical construction.

In view of the light draft of a cultivator an engine developing about 8 hp. on the brake would seem to be amply powerful. The type of engine most suitable, its arrangement on the frame, the driving connection to the traction wheels and the method of steering still await solution.

## Plan Department of Aeronautics

### Senator New Introduces Bill Creating Secretary of Aeronautics at \$12,000

WASHINGTON, Aug. 2—The establishment of a Department of Aeronautics under the direction of a Cabinet officer, to be known as the Secretary of Aeronautics, is proposed in a bill offered to the Senate by Senator Harry New of Indiana.

The Secretary of Aeronautics would be similar to the Minister for Aeronautics as established in England. He would have authority over all the aircraft activities of the Government, direct and complete control of all matters pertaining to the design, purchase or manufacture of aircraft and aircraft equipment intended for the use of the Army, Navy or Marine Corps. The Cabinet member would be appointed by the President, confirmed by the Senate, and would receive a salary of \$12,000 a year.

The introduction of Senator New's bill is the result of the recent agitation for the creation of a department to assume complete control of the aircraft situation. It is reported that both Secretary of War Newton D. Baker and Secretary of the Navy Josephus Daniels are opposed to disturbing the present management of the aircraft problem.

The text of Senator New's bill follows:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled:

Section 1. That there is hereby created for the period of the present war, and for one year thereafter, an Executive Department of Aeronautics, the head of which shall be designated the Secretary of Aeronautics, who shall be appointed by the President and confirmed by the Senate. He shall be a member of the Cabinet and shall receive a salary of \$12,000 a year. The Secretary of Aeronautics shall have direct and complete control of all matters pertaining to the designing, purchase, manufacture and production of aircraft and aircraft equipment intended for the use of the Army, the Navy and the Marine Corps of the United States.

Section 2. The department shall also have an Assistant Secretary who shall be appointed by the President and confirmed by the Senate, who shall receive a salary of \$5,000 a year; and such other officers and employees as may be found necessary for the proper and efficient transaction of the business of the department.

Section 3. The unexpended balance of such appropriations as may have hitherto been made for the purchase and manufacture of aircraft and aircraft equipment and all appropriations which may hereafter be made for such purpose shall be available for the purposes of the department.

In introducing the bill Senator New explained: "I am satisfied that this is the best solution of the aircraft difficulties. It is based upon conclusions reached as a result of 3 months of careful investigation. It is in accord with the opinion expressed by practically all the officers we have examined, as well as the present and former officers of the aircraft management."

"England had to come to it long ago. I do not believe that it will ever be possible to bring about the highest efficiency necessary to the production of the great number of planes we need to win the war as long as there is divided authority, and there is no getting away from the fact that there still is divided authority in the handling of our aircraft program."

"I have become convinced that it is almost impossible to bring two great departments into co-ordination."

The Senate Aircraft Committee has practically completed its investigations. The report will be filed in the Senate shortly after Congress resumes its sessions. Four hundred Liberty engines were produced in July, and it is estimated that 500 will be turned out this month, according to a statement by John D. Ryan. The peak of production, he said, would probably be reached in November or December. Orders have been placed for 50,000 Liberty engines, 27,500 of which will be turned over to the Allied government.

### For Standard Petroleum Specifications

WASHINGTON, Aug. 6—Specifications of petroleum and its products, used by the different departments and bureaus of the Government, will be standardized. The plan is to have standard grades of petroleum and its products for the purpose of avoiding duplication of effort, and for economical reasons.

Standardization will be accomplished by a Committee on Standardization of Petroleum Specifications to be composed of a chairman appointed by the United States Fuel Administrator, a member appointed by the Secretary of War, a member to be appointed by the Secretary of the Navy, a member to be appointed by the chairman of the Shipping Board, a member to be appointed by the Railroad Administration, a member to be appointed by the Bureau of Mines and a member to be appointed by the Bureau of Standards.

The specifications adopted will be binding upon and govern all departments, bureaus, agencies and offices of the Government. The United States Fuel Administrator, acting through the committee, will also effect a standardization of petroleum specifications for the purchases in the United States of the allied governments.

## Bar Profiteering in Farm Implements

### Makers and Dealers Must Replace Stocks—Take Action to Prevent Hoarding

WASHINGTON, Aug. 6—Manufacturers, wholesalers, retailers or other dealers having a regular stock of farm equipment including tractors or tractor plows and who sell these out at replacement value during rising prices without replacing or intending to replace the stock and sell at replacement values when prices are falling, will be considered profiteers according to a statement made to-day by the Office of Farm Equipment Control of the U. S. Department of Agriculture.

Farm equipment held, contracted for, or arranged for, by manufacturers, wholesalers, retailers or other dealers in excess of the reasonable requirements of the business, for use or sale in a reasonable time will constitute hoarding.

The prices of farm equipment are more or less seasonal, but if the price should rise or fall during the season, then, to be consistent, a person who wishes to sell on the basis of replacement values would be obliged to sell at a loss if the price fell. Equipment carried over from one season to another—that is, the residual from a previous season's reasonable supply—should be considered in the same manner. Therefore, if persons have sold at replacement values, they must continue to do so when a drop in prices comes, and carry the same amount of stock as in the beginning throughout the period of the high prices in order not to profiteer.

In short, says the statement, it will not be considered profiteering if farm equipment is sold on the basis of replacement prices, provided the goods sold are replaced at once at replacement prices and this practice is continued during the period of high prices caused by the war.

It will be considered hoarding if any manufacturer, wholesaler, retailer, or other dealer, holds, contracts for, or arranges for a quantity of farm equipment in excess of the reasonable requirements of his business for sale by him over a reasonable time. Manufacturers, wholesalers, retailers, and other dealers finding themselves inadvertently in this position should sell at cost plus a fair usual profit.

### Start Hupp Industrial Wagon Production

DETROIT, Aug. 7—The Hupmobile "Industrial Wagon," which will have a rated capacity of 1000 lbs., will be put in production within the next 2 weeks, and it is expected that the vehicles will be ready for the market early in September. The vehicle will be mounted on the standard Hupmobile chassis and the body will be convertible into various types. No price has been decided on.

# Automotive Industries □

## Car Makers Unanimously Agree on 50% Cut in Production

National Automobile Chamber of Commerce Votes to Limit  
Output to Half That of Last Year—War Industries  
Board Sub-Committee Appointed

WASHINGTON, Aug. 8.—Eighty members of the National Automobile Chamber of Commerce met in Detroit Tuesday, Aug. 6, and voted unanimously in favor of a 50 per cent curtailment of passenger car manufacture. This means a 50 per cent reduction of the production of last year.

The meeting and the curtailment resolution were the direct result of a conference early in July in Washington between Hugh Chalmers and Alfred Reeves, representing the automobile industries, and the War Industries Board. At that meeting Bernard M. Baruch, chairman of the War Industries Board, suggested that the passenger car makers get together and determine what they thought would be a safe maximum curtailment. Mr. Baruch at that time made mention of a possible 75 per cent cut, but did not stipulate this figure.

In voting for a 50 per cent curtailment manufacturers reached what they believed is the largest cut in production compatible with industrial conditions. They believe that by cutting production 50 per cent, combined with the war work they have taken on, they will just be able to retain their organizations and operate their businesses efficiently to maintain them through the present emergency.

At the last meeting with the War Industries Board Mr. Chalmers pointed out the harmful effect of a considerable curtailment, telling that ruin would be brought to the state of Michigan and other passenger car manufacturing centers if a drastic curtailment were insisted upon.

Mr. Chalmers and Mr. Reeves arrived in Washington to-day and will immediately hold a conference with the War Industries Board.

Mr. Chalmers, Mr. Reeves and Charles C. Hanch of the Automobile Section of the War Industries Board conferred with J. Leonard Replogle and Mr. Baruch and presented to them the resolution together with a pledge from the manufacturers. No further discussion regarding curtailment was undertaken.

A sub-committee of the War Industries Board has been appointed consisting of Alexander Legg, chairman of the Requirements Division; Judge Edwin B. Parker, chief of Priorities; George N. Peek, director of Finished Products, and J. L. Replogle, director of the Steel Sec-

tion. This committee will confer further with Chalmers with regard to curtailment for the future.

### Car Production Reduced

DETROIT, Aug. 6.—The most marked change in this territory in the passenger car manufacturing field is the gradual reduction of production. As recently reported in AUTOMOTIVE INDUSTRIES, many manufacturers are nearing the 25 per cent line of production—some have already arrived at this figure.

Whether this output will be reduced still further is a matter of conjecture, and manufacturers are very reticent about making any prophecies regarding the future. They will continue production up to the limit of their ability to secure materials, many feeling optimistic about the situation and believing relief of the great strain under which they are laboring is close at hand.

Production of Willys-Overland, Inc., averages 400 daily; that of the Paige is 35; Reo has reduced its production 50 per cent compared with a month ago; it is now 40 cars per day, while the output of the speed wagon is 25 daily; Buick's production is in the neighborhood of 175 daily; Chalmers 50; Harroun is reported at 10; King averages also 10; Liberty produces 7, and Scripps-Booth 40. Ford passenger cars come out at the rate of 350 a day and the trucks at 400. Packard, Hupp, Briscoe and Columbia production figures are the same as reported a month ago,

### Copper Price Set at 26 Cents

WASHINGTON, Aug. 8.—The maximum price of copper will remain 26 cents per lb. until Nov. 1 through an agreement reached to-day between the Price Fixing Committee of the War Industries Board and the copper producers. This price is subject to approval by President Wilson.

### War Profits Tax In Controversy

WASHINGTON, Aug. 7.—A controversy between the Treasury Department and the Ways and Means Committee has developed as to the most effective method of taxing war profits. The Treasury asks for:

A straight tax of 80 per cent on all war profits and as an alternative the excess

profits tax left just as it is in the existing law which is from 20 to 60 per cent.

The Ways and Means Committee desires:

An excess profits tax running from 30 to 50 and 80 per cent on the net income of corporations. It is willing to provide as an alternative a war profits tax of 80 per cent so that the Treasury could exercise its option and apply the tax which would produce the most revenue.

Arguments by experts of the Treasury Department failed to move the Ways and Means Committee yesterday. Chairman Kitchin and others of the committee contended that large corporations would not pay a sufficient tax on non-war products and activities if the present excess profits tax is allowed to remain. It was stated that Henry Ford and other large passenger car manufacturers would "get off too easily."

Chairman Kitchin stated that \$200,000,000 would be lost by the Treasury plan. The Treasury Department contends that the Ways and Means Committee plans would cost the nation far more by driving out of business those corporations whose profits are only indirectly or not at all due to the war.

The following two examples were given by Mr. Kitchin to show how the two systems would work:

Take a \$100,000 corporation which made \$6000 before the war and now makes \$25,000. Under the Treasury's plan the corporation would be taxed \$15,200 while under the existing excess profits rates it would be taxed \$4400.

Another \$100,000 corporation which made \$25,000 before the war and is making \$25,000 now would pay nothing under the Treasury's war profits tax and would be taxed only \$4400 the same as the other corporation.

In other words the corporation which has for years enjoyed a steady income of \$25,000 would pay only \$4400 and the other which has a sudden increase due to the war will pay more than \$15,000. The committee's schedule of excess profits taxes would compel the second corporation to pay at least \$8000 instead of \$4400. We would equalize the burden at least to that extent.

### Cleveland Tractor to Be Made in Great Britain

LONDON, July 22—It is announced that the H. G. Burford Company, which formerly sold the Burford truck and has been handling the Cleveland tractor in Great Britain, has secured from the British Government a license to manufacture the Cleveland tractor in that country. It is said that 250 of them are being built and will be ready for delivery in September.

### War Revenue Tax Nets \$23,981,000

WASHINGTON, Aug. 7.—Automobile and motorcycle manufacturers and dealers paid into the Treasury Department \$23,981,000 under the war revenue bill for the year ended June 30, 1918, according to a statement issued yesterday by the Treasury Department.

## June Exports 28% Over May

But Show a Decided Drop  
from the Figures of a  
Year Ago

1918				
Cars	Value	Tr'ks	Value	Parts
June..3,098	\$2,808,463	829	\$2,001,488	\$3,195,353
May..2,801	2,907,390	866	1,958,603	2,859,496
1917				
June..7,582	5,712,677	1,245	2,965,254	2,902,862

WASHINGTON, Aug. 5—Exports of passenger cars, trucks and parts during June amounted to \$9,904,768. This is a gain of 28 per cent on the figures for May, but represents a loss of 30 per cent when compared with the exports for June, 1917. There is but little difference in the number of passenger cars shipped as between May and June, 1918, the totals being 2801 and 3098 respectively, whereas in June, 1917, 7582 cars were exported. The month's car exports of a year ago were valued at more than double the amount for June, 1918.

Commercial car exports for June show a slight decrease in number as compared with May, although their value is slightly higher. In June, 1917, when 1245 trucks, valued at \$2,965,254, were exported both number and value were approximately 50 per cent higher than during the same month this year.

The fact that only one airplane was exported during June indicates very clearly that planes for military use are not included in the published export figures. Airplane parts show a big increase from the figure of \$771,673 in May to \$1,-

609,503 in June, 1918. The total for June, 1917, was \$501,473 and the complete total for the twelve months ending June, 1918, was \$8,446,077 as against \$3,133,903 for the previous year.

Canada continues as the leading buyer of passenger cars and it is of interest to observe the relatively big figures representing Chile's purchases which tend to indicate that full use is being made of the return trips of nitrate ships to that country. France and the United Kingdom are the leading buyers of commercial cars, although Canada is a steady customer. The year's figures covering the export of tractor and creeper type engines show a great increase in comparison with the 1917 totals.

### Coal Committee Postpones Trip

DETROIT, Aug. 1—Due to Fuel Administrator Garfield's absence from Washington at this time the delegation of business men that was to see him regarding Detroit's supply of anthracite has been postponed for 2 weeks. The primary object of this committee is to lay before the fuel administrator the true condition of the fuel situation in Detroit with a plea that more anthracite be sent here. Unless more coal can be secured for this territory a great many Detroit homes of workers will be heatless this winter, which would probably result in a shortage of workmen.

### Patent Rights for Bevel-Edge Granted

DETROIT, Aug. 5—Joseph H. Bourgon, body engineer of the Studebaker Corp., was granted patent rights covering the use of a bevel-edge around the top of an automobile. The bevel-edge is one of the most outstanding features of the new series 19 Studebaker.

## Tractors Are Wanted in Mexico

250 Imported Recently; More  
Wanted—Government Is  
Paying for Them

LAREDO, TEX., Aug. 3—Information in regard to the revival of various lines of industry in Mexico is brought here by C. J. Boothroyd, general agent of the Constitutionalist Railways of Mexico, formerly called the National Railways of Mexico. Mr. Boothroyd makes his headquarters in the City of Mexico and has recently traveled extensively over that country. He says that special efforts are being directed by the Carranza government toward introducing modern American methods of agriculture upon the larger plantations.

One of the important steps in this direction has been the recent importation of 250 farm tractors from the United States. These tractors have been distributed among farmers of different sections and are now employed in breaking land and in other farm operations. The cost of these machines was borne by the government.

More than 100 additional tractors have been ordered and will likewise be distributed among the more progressive plantation owners as soon as they are received in this country. It is claimed that special advantages are offered for the use of tractors in agricultural work in Mexico on account of the large size of most of the cultivated tracts of land. In the Laguna district around Torreon, where an average annual yield of about

### Exports of Automotive Equipment for June and Twelve Previous Months

	Month of June				Twelve Months Ending June, 1918			
	1918		1917		1918		1917

100,000 bales of cotton is obtained, tractors have been in use for several years upon some of the plantations. They have proved highly successful.

Before Germany began the present war, practically all of the farm machinery and equipment, including tractors, in use in Mexico came from that country. This was due almost altogether to the fact that the hardware and farm implement and machinery business of Mexico was in the control of Germans. In nearly every town and city of any consequence in the country there were establishments of this kind owned by Germans. They patronized manufacturers in Germany exclusively and as a result nearly all of the farm implements and machinery up to the beginning of the war were of a German pattern.

There promises to be a rapid and large development of this character of trade with the United States. One cause is that German dealers in Mexico have been placed upon the black list by the American government under the Trading With the Enemy Act. All trade relations, of course, with Germany have been cut off, and now that they are unable to obtain stocks from the United States they are practically excluded from further doing business. Many new firms have entered the hardware and farm implement and machinery business in Mexico during the last several months. In most instances they are composed of either Americans or Mexicans. The new concerns are showing a progressive spirit in the matter of building up business, and it is believed that the Germans will find it difficult to recover the trade which they have already lost in Mexico.

#### New Return Loads Bureaus for New England

PROVIDENCE, R. I., Aug. 3.—Plans for a system of Return Loads Bureaus throughout New England were further advanced following a meeting held here on Thursday, which was attended by representatives from all the states in this group. F. W. Aldrich, who is chairman of the Rhode Island Commercial Economy Board, presided. Stoughton Bell, representing the Boston Chamber of Commerce, reported that his organization had decided to inaugurate a bureau, following the report of a committee which investigated and favored the plan. He stated that \$4,000 has been pledged to carry the work along for 6 months, after which it may be self-supporting or nearly so from fees received from those utilizing the bureau. Massachusetts state officials are in hearty co-operation with the plan, and the committee on Public Safety has pledged \$1,500 toward the expenses of the bureau, and has placed at its disposal all the facts and figures gathered by Francis Hurtubis, Jr., chairman of its motor car and truck division, on vehicles and highways in the state following a 6 months' investigation. The Chamber of Commerce will put up \$1,000 and the motor truck dealers have pledged another \$1,000. The remaining \$500 has been raised from teaming and manufacturing interests.

## Another Increase in Gasoline Output

More Than 10 Million Gal. a Day Produced During May—Crude Output Also Greater

Production		
	May, 1918	April, 1918
Crude oil (bbl.).....	28,510,698	26,201,554
Gasoline (gal.).....	319,391,202	293,396,160
Stocks on Hand		
	May 31, 1918	April 30, 1918
Crude oil (bbl.).....	11,824,633	12,600,062
Oil purchased to be re-run (bbl.).....	872,300	954,205
Gasoline (gal.).....	460,637,479	509,197,134
Kerosene (gal.).....	348,311,945	393,527,476
Gas and fuel (gal.).....	516,020,224	471,644,479
Lube (gal.).....	161,009,729	144,383,212

Coke (ton).....	15,583	13,109
Asphalt (ton).....	104,214	101,328
Miscellaneous (gal.).....	317,115,697	248,260,551

WASHINGTON, Aug. 5.—During May, 1918, the average daily production of gasoline was 10,302,942 gal., which was an increase of 523,070 gal. per day over the production of April. The total production for the month of May was 319,391,202 gal.

The stock of gasoline on hand, according to figures just issued by the Bureau of Mines, was, on the last day of May, 1918, 460,637,479 gal., which is less than was on hand on April 30, the figures for the latter date being 509,197,134 gal.

The production of crude oil in May totaled 28,510,698 bbls. for the month, which gives a daily average of 919,700 bbls. The stock of crude on hand on May 31 was 11,824,633 bbls. as against 12,600,062 bbls. for April 30.

The accompanying tables show the production of crude oil and gasoline for May as compared with April, and the stocks on hand of crude oil and its derivatives as of the last day of each of these two months.

#### Export Regulations Modified

WASHINGTON, Aug. 2.—A simplified procedure has been adopted for exports to the United Kingdom, France, Italy or Belgium, excluding their colonies, possessions and protectorates, and for goods destined to any colony by way of these countries excepting shipments to Switzerland by way of France or Italy.

After Aug. 12, 1918, applications for licenses to export any commodity to the above named countries will be refused if the applicant subsequent to that date and prior to the issuance of the license applied for shall purchase or otherwise acquire or commence to manufacture or produce or fit the articles specified in the application for the fulfillment of a specific export order. New forms have been devised by the War Trade Board, which will be given to shippers upon application to meet the new rulings. Applications for licenses to export to France must have attached thereto a copy of the French Government Attestation. Applications filled in the proper forms and mailed to the War Trade

Board will be referred by the board to the war mission of the allied country for which the shipment is intended. Export licenses under the new procedure will be valid 90 days, with extensions allowed for unusual cases.

#### The Government's Purchases of Motorcycles and Trucks

WASHINGTON, Aug. 2.—Twenty-seven thousand and five motorcycles and 25,874 side cars for motorcycles were purchased by the Motor Transport Service of the Quartermaster Corps from April 8, 1917, to July 1, 1918. This includes all the purchases made by the original Motor Transport Section which was under Brig.-Gen. Chauncy D. Baker and Christian Girl. During the same period 8809 motor truck ambulances were purchased.

On July 1 reports showed 4308 motor trucks of less than 1-ton capacity, 5703 1½-ton trucks, 7987 3 to 5-ton trucks and 3420 passenger cars overseas.

Prospective deliveries of motor trucks for July were 4797, for August 4355 and for September 4448.

#### Supplementary Priorities Issued

WASHINGTON, Aug. 1.—Supplementary to the recently announced priority regulations, the War Industries Board has given class B-4 priority to the maintenance of jobbers stocks of plates, sheets, bars, shapes, tubular products, wire and wire products, heavy hardware, farm implements, oil well supplies and similar products.

Class A-6 priority has been allowed for the operation and maintenance (not new construction expansion or replacement) of coke oven plants, smelters, furnaces, rolling mills, wire drawing mills, pipe and tool mills employed in the production of fuels, metals and metal products.

Class C priority has been allowed for materials, equipment or supplies for the maintenance of existing equipment, for the supply of light, heat, power and sanitation; the necessary supplies and essential repairs (not expansions or replacements) to existing buildings and manufacturing plants; the operation of machine shops and blacksmith shops; nails, screws, bolts and nuts used for any purpose.

#### For Fixed Price Contracts

WASHINGTON, Aug. 3.—Fixed price contracts will be used hereafter whenever possible in the purchase of supplies for the War Department. In exceptional cases, only where it is clearly to the advantage of the Government, a cost plus contract will be used. This will be a cost plus fixed compensation rather than a cost plus percentage contract. These decisions were made to-day by the Superior Board of Review of the General Staff. Decisions on contracts will not be left to individuals. All cost plus contracts will first be reviewed and approved by the particular supply bureau's board of review and must first be approved by the Superior Board of Review.

## Francis E. Stanley Is Dead

### Steam Car Pioneer Succumbs to Injuries Received in Automobile Accident

NEWTON, MASS., Aug. 1—Francis E. Stanley, one of the Stanley brothers of Newton, Mass., famous pioneers of the carriage industry, died as a result of an automobile accident near Ipswich, Mass., on July 31. Mr. Stanley was returning from a trip through Maine, and was in the car alone at the time.

Where the accident occurred the road is high crowned, and Stanley is reported to have driven at a considerable speed. The car slewed and overturned, and Stanley was pinned beneath it. Help was soon at hand and the injured man was rushed to the hospital at Beverly, but he died on the way.

The mention of Stanley's name carries with it memories of the early days of the automobile history. The Stanleys originally came from Maine, having been born (the brothers were twins) in Kingsfield, Franklin County, on June 1, 1849. At one time they lived in Lewiston, Me., where they learned of the works of an early steam vehicle experimenter, E. F. Fields.

During his youth F. E. Stanley worked as a carriage maker, portrait artist and photographer, and later the two brothers engaged in the manufacture of photographic dry plates at Newton, Mass.

Their attention was again directed to automobile development by an exhibition at the Brockton, Mass., fair in the fall of 1896. They set to work to build a steam runabout, and produced a machine light in weight, attractive in appearance, silent in operation and comparatively powerful.

The first machine was sold in August, 1898, and its success induced the Stanley brothers to make plans for manufacturing the vehicle on what was then regarded as a large scale. By the end of the year they had a lot of 100 cars going through the plant, and more than this number had been sold. Some of the major parts were being made by outside concerns, and the work at the Newton plant, which comprised a frame building at which the experimental work had been done, and a machine shop erected during the spring of 1898, was practically limited to their sampling. However, the various parts were all designed by or under the direction of the Stanley brothers, who also supervised the manufacturing operations.

In the spring of 1899 John Brisben Walker, at the time publisher of the Cosmopolitan magazine, and quite a prominent figure in national affairs, purchased from the Stanley brothers the right to their steam car, as well as the plant at Newton, Mass., and secured the services of the Stanleys for a period of one year. The deal, which involved a cash payment of \$250,000 to the Stan-

FRANCIS E. STANLEY

leys, occasioned much discussion at the time, partly on account of the large sum involved and partly because the Stanleys had as yet no basic patent on their vehicle.

Shortly after having acquired the Stanley rights Mr. Walker disposed of a half interest in them to Anzi Lorenzo Barber, an asphalt magnate. For a time Messrs. Walker and Barber managed the business jointly, but later two companies were organized to manufacture the little steamers, the Locomobile Company of America, of which Mr. Barber was president, and the Mobile Company of America, of which Mr. Walker was the head, and both began to manufacture runabouts of substantially identical design, known as the Locomobile and the Mobile respectively.

After their year's contract with the Locomobile company had expired, the Stanley brothers set to work to bring out a car of improved design, and eventually they bought back the factory plant in Newton, which had gone to the Locomobile company in the deal whereby they took over the Stanley business. Although there was a serious slump in the demand for steam cars not long after the Stanleys had started again under their own name, they made a success of their new venture, and the Stanley steamer is still being produced to-day, many improvements in its design having been introduced in the course of time.

About a year ago the Stanley Car Co. was reorganized, and the two brothers retired from its active management. Mr. Stanley is survived by his wife, by a son, Raymond Walker Stanley, now in France, and two daughters, Mrs. Edward M. Hallett and Mrs. Prescott Warren, both of Newton, Mass.

#### Indian Office Asks Bids on Passenger Car

WASHINGTON, Aug. 5—Bids are requested by the Indian Office, Washington, D. C., for one 6-cyl. automobile, two-passenger model, complete with top and usual equipment. Proposals for the bids will be received up to Aug. 15, 1918.

## Map Route for Tour by Airplane

### British and American Officers to Fly Over 14 Cities in Demonstrations

WASHINGTON, Aug. 5—Plans for the aviation tour by American and British aviators, recently announced in AUTOMOTIVE INDUSTRIES, have been completed. Major General William L. Kenly, Director of Military Aeronautics, has placed Major C. I. Rhinehart in command of the party. The guest of honor will be Brig. General C. F. Lee, head of the British Aviation Mission in this country. The party will comprise several American pilots with American planes, and General Lee, accompanied by several British pilots with British planes. The cities and states for the tour are as follows, subject to alteration in event of unfavorable weather conditions:

Cincinnati .....	Aug. 14
Dayton .....	Aug. 15
Columbus .....	Aug. 16
Cleveland .....	Aug. 17-18
Toledo .....	Aug. 19
Detroit .....	Aug. 20-21
Indianapolis .....	Aug. 22-23
St. Louis .....	Aug. 24-25
Kansas City .....	Aug. 26-27
Des Moines .....	Aug. 28-29
Omaha .....	Aug. 30-31
Minneapolis and St. Paul .....	Sept. 1-2-3
Milwaukee .....	Sept. 4
Chicago .....	Sept. 5-6

The visits to Des Moines and St. Paul will come at the time of the Iowa and Minnesota State Fairs. The visit to Chicago will come during the Allied War Exposition, which takes place there Sept. 1-15.

#### Chandler Profits to June 30, \$1,250,000

CLEVELAND, Aug. 5—After making a liberal provision for war taxes, the profits of the Chandler Motor Co. as of June 30 were somewhat in excess of \$1,250,000. When the books of the company were closed for the year 1917, the total was \$12,400,000. When the books of the company were closed for the year 1918, the total was \$12,500,000. The production of passenger cars by the company has fallen off to about the same extent as other big companies.

#### New Building for Accessory Manufacturer

DETROIT, Aug. 3—The Motors Metal Mfg. Co., makers of sheet metal parts for cars, trucks and tractors, is building an addition measuring 65 x 260 to its main factory plant. The company is at present devoting approximately 70 per cent of its output to Government work and is, in addition, manufacturing a line of fenders and streamline hoods for Fords.

## The S. E.-5A Fighting Plane

**T**HIS machine has been adopted by the U. S. Army authorities in place of the discarded Bristol design. The British model here illustrated made its appearance in June, 1917.

### July Air Mail Service Surpasses June

WASHINGTON, Aug. 6—The July record of the Air Mail Service, as shown in the monthly report of Second Assistant Postmaster General Praeger, surpasses that of June. Of 108 possible flights in July, 98 perfect flights were made, without interruption through forced landings or mechanical troubles. Only two of the 108 trips were cancelled on account of weather, and only eight forced landings were made. Four of the forced landings were by an officer new in the work and the route. The flights during the month covered a total of 11,855 miles.

The best performances made by aviators were in the order following:

Lt. J. C. Edgerton, 18 perfect trips with a total of 2430 miles, without a single interrupted flight.

Lt. Walter Miller, 19 perfect trips with an aggregate of 1710 miles, without a single interruption.

Lt. E. W. Killgore, 16 perfect trips, aggregating 2160 miles, and one interrupted flight and one uncompleted flight.

Lt. H. P. Culver, 14 perfect flights, aggregating 1080 miles, and one interrupted flight.

During the month all mail speed records were broken when on July 29 the mail was carried from Washington to New York in 2 hours and 5 minutes flying time.

Storm flying records were established when Lieuts. Edgerton, Bonsal and Killgore put their machines through driving rain and wind storms that practically shut out visibility, flying entirely by compass and making perfect landings. On the New York-Philadelphia end, several flights were made by Lieuts. Miller, Culver and Webb through fog, haze and rain.

### Tractor Import Restrictions Modified

LONDON, July 22—It is understood that the Government has agreed, although no official announcement of the

fact has been made up to the time of writing, that British importers and dealers in imported tractors may fix the price at which they are sold on a basis of cost plus 33 1/3 per cent. Under the conditions which have governed the importation of tractors into England up to this time the Government has found space on incoming ships for those tractors for which import licenses have been issued, with the understanding that the public selling price of the tractors should be calculated on the net landed cost in England plus 25 per cent. In other words, the selling price includes an available gross profit of 25 per cent to cover the importer and the dealer and all selling expenses. It has been found that this margin is too small, with the result in many cases that tractors have to be handled by dealers at a margin of 7 1/2 per cent gross discount.

The new arrangement will give the importer and dealer a margin to work upon sufficient under existing conditions.

### Federal Control of Oil

WASHINGTON, Aug. 1.—Federal control of the oil industry will probably be announced within the next few weeks, the plan being chiefly designed to eliminate competition and to fix prices. The control will be used, however, in the future, if occasion demands, to keep up the military supplies of this country and the Allies. It is now thought that it will be more or less of a voluntary nature, although the provisions of the Lever bill are available if needed. Competition will be eliminated by fixing prices of crude oil in the various fields and setting a maximum figure on bonuses. It is likely that a series of price differentials will be issued based on the price of crude oil.

### Packard and Dodge Salesrooms to Merge

BOSTON, Aug. 5—On September 15 the Packard and the Dodge Brothers motor cars and trucks will be sold under one roof in Boston, bringing about one of the biggest consolidations to cut down overhead in the country. A few weeks ago the announcement was made that they had consolidated at Worcester, and the present announcement will dissipate a lot of gossip about what Alvan T. Fuller intended to do in Boston, which comprised everything from running for governor to abandoning the motor industry all together.

Under the plan, the C. S. Henshaw Co., handling Dodge Brothers cars, will concentrate with the Packard forces in the big Packard building 1079 Commonwealth Avenue. It is not a merger of the two businesses, for each company will keep its working forces intact, with the same executives in charge of each department.

The Henshaw company has had to maintain three buildings to meet the growth of the sale of cars and trucks. Two of these will be vacated, the big salesrooms on Boylston Street, the largest on that thoroughfare, and the service station on Beacon Street. The newly opened service station on Commonwealth Avenue will be retained.

The Packard salesrooms will remain as they are, and the Dodge Brothers cars will be sold in the Easterly wing of the Packard plant where used Packard cars and trucks were sold. This building, rumor had it, was going to be turned over to the Government. The plan of consolidation worked so well at Worcester with these two firms that the Boston plan was the result, and it will save the Henshaw company some \$25,000 a year overhead expenses.

## Unskilled Labor Allotment

### Quota for Each State as Determined by Demand of War Industries Up to Oct. 1

WASHINGTON, Aug. 2—Quotas of unskilled labor to be furnished by the various states to war industries during the next two months were allotted yesterday. Immediate steps will be taken to find more unskilled workers for Government projects during the next few weeks. Following are the quotas allotted the different states. The United States Employment Service in each state will supply the numbers of men mentioned below as called upon for war work:

Alabama	2,070
Arizona	1,350
Arkansas	1,980
California	21,555
Colorado	5,175
Connecticut	8,460
Delaware	855
Florida	2,520
Georgia	3,105
Idaho	11,035
Illinois	40,230
Indiana	10,710
Iowa	5,805
Kansas	5,175
Kentucky	4,140
Louisiana	4,500
Maine	3,915
Maryland	7,335
Massachusetts	30,150
Michigan	12,330
Minnesota	9,405
Mississippi	1,125
Missouri	12,915
Montana	3,060
Nebraska	4,185
Nevada	810
New Hampshire	2,520
New Jersey	24,705
New Mexico	585
New York	86,490
North Carolina	2,205
North Dakota	1,945
Ohio	25,245
Oklahoma	3,870
Oregon	4,410
Pennsylvania	42,570
Rhode Island	4,815
South Carolina	1,440
South Dakota	1,350
Tennessee	3,465
Texas	7,290
Utah	2,115
Vermont	1,575
Virginia	4,590
Washington	11,340
West Virginia	3,870
Wisconsin	8,685
Wyoming	900

The total of the quotas represents the immediate and future unskilled labor requirements of war industries which had filed applications for workers up to July 31. Future needs are figured up to Oct. 1. Many war industries have not yet reported their requirements, but are expected to do so by Aug. 15, following which their needs will be tabulated and supplementary quotas will be issued.

It is now known that 451,000 unskilled workers are needed. It is expected this number will be doubled when the fall requirements are filed.

In the industrial states the present quotas average about 5 per cent of the estimated number of men who are not in military service or already engaged in war work, agriculture, mining or transportation. In Western and Southern agricultural states the average percentage is somewhat higher, as allow-

ance has been made for unfilled farm labor needs.

The primary purpose of the quota system is to protect any state or community from being drained of unskilled labor unfairly and to insure a fair contribution to the needs of war work from all parts of the country. It will operate to the advantage of the farmers of the country who, for the past year, have been the worst sufferers from unregulated independent labor recruiting.

#### Teach Packing to Save Space

WASHINGTON, Aug. 3—A school instructing officers and enlisted men in boxing and crating has been opened at Madison, Wis., to utilize cargo space to the best advantage. Instruction will be given to men from all departments that make overseas shipments. The course requires three weeks at the University of Wisconsin and one week in the box factory of two corporations.

#### Ben Hur Plant Acquired by Government

CLEVELAND, Aug. 2—The plant of the defunct Ben Hur Co. at Willoughby has been leased by the government for the duration of the war, and the factory is already being placed in readiness for the work. The Ben Hur plant is on a parcel of 8.66 acres, and the factory building is 150 by 400. In addition there is an office building containing 6000 sq. ft. of floor space; also a boiler house.

#### Government Wants Oil Experts

WASHINGTON, Aug. 3—The Bureau of Oil and Natural Gas Conservation, United States Fuel Administration, needs six field inspectors whose work will consist of visiting oil and gas-producing localities to ascertain the condition of wastage of oil and gas. The bureau also desires the services of eight fuel oil combustion engineers. As far as possible, all are desired to volunteer their services to the Government during the period of the war, but if this is not possible, a fair remuneration together with necessary expenses will be paid. Only men having had experience in these respective lines need make application.

## Europe Has 522,122 Passenger Cars

### Great Britain Leads with 171,607, but Monaco Has Highest Proportion

TURIN, ITALY, July 14—According to figures compiled and recently announced by the Fiat Press Bureau the number of passenger cars in Europe is 522,122, Great Britain leading with 171,607 in 1917. On the list, which is printed below, Germany stands second with 95,000 cars in 1914, which is the last year for which statistics are available. France with 98,400 and Italy with 35,500 are third and fourth respectively.

The returns for Great Britain show a decrease over those for 1914, the numbers used in the compilation being of passenger cars only. During the war period, as is well known, Great Britain has added very materially to the number of commercial vehicles of which she makes use. The number of privately owned motor cars in France before the war was about 115,000. It is estimated that approximately 80,000 cars to be used for war purposes have been imported since. In number of inhabitants per car the Principality of Monaco heads the list with one car for every 95.6 inhabitants which shows a higher proportion of cars to population than any other country. England comes second in this particular with one car to every 268.5 persons.

The list below shows the number of cars in service in European countries during the latest years for which returns are available.

#### Organize to Supply Engineers

MILWAUKEE, Aug. 5—To provide an organization which will devise ways and means of supplying the Government with competent engineers upon call, representatives of each of the Milwaukee chapters of national engineering associations have formed a council under the direction of John D. Ball, E.E., M.E., secretary of the department of public affairs, Mil-

### A Census of Europe's Passenger Cars

Countries	Number of cars.	Year	Population	No. of inhabitants per car.
Great Britain	171,607	1917	46,087,000	268.5
Germany	95,000	1914	65,000,000	684.0
France	98,400	1916	39,600,000	402.0
Italy	35,500	1918	35,587,784	1,002.0
Russia	27,900	1916	148,289,000	531.5
Austria Hungary	19,360	1916	52,608,000	2,671.7
Belgium	14,700	1916	7,580,000	515.6
Spain	10,263	1918	20,400,000	1,989.6
Holland	10,000	1917	6,583,226	658.0
Sweden	9,030	1916	5,638,500	626.5
Denmark	8,500	1917	2,919,000	343.0
Switzerland	6,157	1914	3,765,000	611.0
Portugal	3,211	1917	5,433,000	1,692.0
Norway	3,067	1918	2,240,000	730.0
Bulgaria	3,050	1916	4,330,000	1,419.6
Roumania	2,500	1913	7,248,061	2,899.0
Finland	2,000	1917	3,600,000	1,800.0
Greece	800	1917	3,912,000	4,890.0
Turkey	500	1913	.....	.....
Monaco	230	1916	22,000	95.6
Serbia	200	1914	4,450,000	22,450.0
Malta	100	1917	224,000	2,240.0
Gibraltar	45	1917	18,500	411.0
Cyprus	15	1917	273,857	18,267.0
Rhodes Islands	14	1917	30,000	2,142.8
Crete	3	1917	365,000	121,666.6

Wauke County Council of Defense. All engineers will be listed and their availability recorded so that when the Government needs technical men of a certain class recommendations can be made. The Milwaukee district draft board, the Council of Defense and each of the larger industries in Milwaukee county will each select a representative on the council. The plan is said to be original with Mr. Ball and much benefit is expected to result, in view of the present unsatisfactory situation with respect to supplying the Government with talent.

#### Avert Serious Machinists' Strike

MILWAUKEE, Aug. 5.—The combined efforts of seven Government labor conciliators averted a serious strike of union machinists in three large plants at Madison, Wis., on Aug. 1. Six hundred men walked out of the shops of the Four Lakes Ordnance Co., Steiner Turret Machine Co. and the Madison-Kipp Lubricator Co. at 11 o'clock a. m. to enforce various demands. As the result of conferences during the afternoon, all of the men returned to work on the following morning, having agreed to let the War Industries Board settle all disputes. Organized machinists in ten other plants at Madison remained on the job with the same provision. All of the shops affected are devoting all or the greater part of their facilities to Government business.

#### Michigan Names Labor Advisory Board

DETROIT, Aug. 3.—The organization committee for Michigan of the United States Employment Service and the Public Service Reserve has named the following advisory board for the state:

James V. Cunningham, director of the Employment Service, chairman; John A. Russell, director of the Public Service Reserve, vice-chairman, and Perry Ward, secretary of the Michigan Federation of Labor, W. G. Bailey, A. A. Templeton and T. Stuart Foote of Grand Rapids, with William B. Wreford, secretary ex-officio, will supervise the distribution of all unskilled labor in the state to manufacturing plants, particularly those engaged in war work.

The advisory committee has approved the appointment of forty-seven Community Labor Boards, which will assist in the mobilization and distribution of common labor for war industries.

#### Appoint Wisconsin Labor Representatives

MILWAUKEE, Aug. 5.—E. J. Kearney of the Kearney & Trecker Co., milling machines, Milwaukee, and F. H. Clausen, head of the Van Brunt Mfg. Co., Horicon, Wis., agricultural tools, have been appointed representatives of the employers of Wisconsin on the state advisory board under the new federal labor recruiting program. Arthur W. Berresford, general manager of the Cutler-Hammer Mfg. Co., Milwaukee, has been selected as employers' representative on the community board for the Milwaukee district.

## Cannot Do Business in Wisconsin

### Foreign Corporations With Non-Par Value Stock Cannot Continue

MILWAUKEE, Aug. 5.—Nearly a score of large manufacturing concerns in Milwaukee are affected by an opinion given by the attorney general of Wisconsin to the effect that foreign corporations with non-par value capital stock cannot be licensed to do business in Wisconsin. Under the opinion such corporations will lose their charters and close their plants in this State unless they reincorporate and place a fixed value upon their shares. However, before any drastic step is taken, the opinion will be printed as a brief and submitted to each company affected, with the suggestion that its attorneys file briefs at a general hearing to be held in about thirty days.

Among the concerns affected are: A. O. Smith Corp., Milwaukee; Allamer Truck Co., Chicago; Nash Motors Co., Kenosha, Wis.; Milwaukee Electric Crane & Mfg. Co., Milwaukee; Badger Mfg. Corp., Milwaukee; National Aniline & Chemical Co., New York; Globe Shipbuilding Co., Superior, Wis., and others.

The question of the validity of the Wisconsin charters of these and other corporations arose when the Railroad Commission, acting as administrator of the Wisconsin Blue Sky act, received an inquiry from the secretary of state as to the basis upon which the license fee of corporations with capital stock that has no nominal or par value is to be determined. Then it was found that the State laws prevent the issue of licenses to such corporations.

In some instances, corporations originally organized under the laws of Wisconsin, desiring to expand, reincorporated under the laws of Delaware or Maine, greatly increased the capitalization, but provided that shares be without par value, then applying for charters in Wisconsin as foreign corporations. The opinion of the attorney general means that this cannot be done legally.

#### Flint Has Federal Employment Office

FLINT, Aug. 1.—The United States Employment Service, Department of Labor, has established an agency at 119 East Kearsley Street, with J. B. Laing, formerly of the Buick Motor Co., the examiner in charge. The agency will take care of the placing of men and women in factories and concerns doing government work. Persons desiring work of this kind can apply at the office the same as for any factory position.

#### Metal Workers Get 8-Hour Day

MILWAUKEE, Aug. 5.—Nearly 40,000 men in the metal trades of Milwaukee county are affected by the voluntary in-

auguration of the basic 8-hour day by most of the large metalworking industries of the district, effective Aug. 1. All of the plants are engaged largely in executing Government contracts. The concession does not mean a reduction of actual working hours, because that would mean curtailment of output, but while the men will work on the same schedules as before they will receive time and a half for all overtime worked above eight hours. This will net the men an increase of about 5 per cent in wages. Most plants are working 54 to 55 hours a week.

#### Shortage of Skilled Labor Still Acute

WASHINGTON, Aug. 3.—Shortage of both skilled and common labor continues acute, according to reports from the various centers and trades of the country. Machinists are needed throughout the East and on the Pacific Coast. There is a general shortage of boilermakers. Toolmakers, lathe hands, blacksmiths and iron workers are wanted in New England, Pennsylvania and along the Great Lakes. Many hulks are reported lying in the river at Portland, Oregon, because of shortage of men to install the machinery.

Mechanics are in demand in New England, New York, Chicago, Atlanta, Georgia, Seattle, Washington and southern Wisconsin. Automobile workers and electrical workers are, however, by no means scarce, according to the reports which show a surplus of automobile workers in the West and Southwest, Missouri, West Virginia and other points, with the only demand coming from Seattle.

Munitions workers are needed at Wilmington, Del., and in northwestern Ohio.

A common labor shortage is reported from Pennsylvania, Connecticut, Virginia, Illinois, Iowa, Oregon and Washington. The only surplus of common labor is reported from the South.

Farm labor is needed throughout the country due to the scarcity of farm workers created by the high wages offered in the war industries and especially shipbuilding.

A surplus of inexperienced female workers and a shortage of experienced women workers is also reported.

#### Pants, Hair Nets and Low Heels for Women Machine Operators

ALBANY, N. Y., Aug. 3.—In the new "dangerous machinery" code of the New York State Industrial Commission, the fact that the number of women engaged in industrial pursuits has materially increased is taken into account and special provisions are recommended for their safeguarding as follows:

"It is recommended in relation to female operatives that where their hair is in danger of being caught in moving machinery, they shall wear caps or hair nets; that where their clothing is in danger of being caught in moving machinery they shall wear pants; that they wear shoes with low heels."

**Obenberger Leaves A. O. Smith**

MILWAUKEE, Aug. 5.—Frank P. Obenberger, for the last five years general superintendent of the A. O. Smith Corporation, Milwaukee, and superintendent of the forge works for four years, before that, resigned Aug. 1 to become associated with his father in the general management of the John Obenberger Forge Co., West Allis, Milwaukee, which is doubling its capacity for the manufacture of crankshafts, camshafts and other automotive forgings. Officers of the Smith company and eighty department heads tendered Mr. Obenberger a dinner, at which he was presented a diamond-studded scarf pin by the officers and a gold watch and chain on behalf of the working force.

L. H. Morrill, who has had charge of the engineering department of the Northway Motors Co. for the last 2 years, resigned, and has been appointed assistant engineer of the Buda Co., Harvey, Ill.

J. R. Harrison has been appointed sales and advertising manager of the Parrett Tractor Co., Chicago. He was formerly advertising manager of the Chalmers company.

Frank L. Wurl, who has been intimately connected with many new developments in automotive ignition, starting and lighting, has been promoted sales engineer of the Remy Electric Co. located at Detroit.

C. A. Spear has been appointed New York State Division sales manager for the Selden Truck Sales Co., Rochester, N. Y. He succeeds L. S. Hallowell, who is to become affiliated with the Philadelphia Selden Sales Agency.

G. M. Rockwell, recently connected with the sales department of the Republic Motor Truck Co., Alma, Mich., has been appointed district manager and special representative of the District of Columbia for the Acme Motor Truck Co. His territory will include Virginia, Maryland, Delaware and North Carolina. J. A. Bell, formerly connected with the White Co., Cleveland, has joined the Acme organization as district manager, with the Gulf States east of Texas as his territory. F. P. Walker will have charge of the western half of Iowa and the entire state of Nebraska.

H. D. W. Mackaye, who has been connected with B. F. Everitt in the receivership settlement of the affairs of the Ross Automobile Co., Detroit, has entered Government service in connection with munitions production, and is located now at Jackson, Mich., as a citizen representative of the Ordnance Department.

Howard C. Caldwell, assistant advertising manager of the Haynes Automobile Co., Kokomo, Ind., has resigned to enter the Great Lakes Naval Training Station.

## Men of the Industry

*Changes in Personnel and  
Position*

**Nash Men Dine Charles W. Nash**

KENOSHA, WIS., Aug. 5.—Department heads and foremen of the Nash Motors Co., Kenosha, Wis., tendered a banquet in honor of Charles W. Nash, president and general manager of the company, who left July 31 for Washington to assume his duties as assistant to John D. Ryan, director of aircraft production, in charge of engineering and production. While in the Government service, Mr. Nash has relinquished active connection with his company.

W. O. Kennington, who was assistant chief engineer of the Remy Electric Co., Detroit, at the time of the outbreak of the war, has returned to Detroit from the war front, where he is connected with the British Air Ministry. He will remain in this country for a month and then return.

H. H. Gildner, manager of the Flexite department of the F. R. Blair Co., New York, has been elected vice-president of the organization.

George L. East, who has been associated with the Oldsmobile interests for 11 years, has resigned his connection as assistant sales manager to join the Gulf Oldsmobile Co. at New Orleans, distributor of Oldsmobile cars for Louisiana.

**Athletic Building Dedicated to Dead Flyer**

MOUNT CLEMENS, MICH., Aug. 5.—The new athletic building which has just been completed at Selfridge Field was dedicated Saturday afternoon to the memory of Second Lieutenant John P. Boyle, an aviator and athlete, the first officer to meet death at the field. Local people assisted substantially in erecting the building, pledging more than \$2,200.

**Dividends Declared**

The Stewart-Warner Speedometer Corp. has declared a regular quarterly dividend of 1½ per cent, payable Aug. 15, to stock of record July 31.

The National Acme Co., Cleveland, has declared its quarterly dividend of three-quarters of 1 per cent, payable Aug. 31 to stockholders of record Aug. 15.

The Continental Motors Corp., Detroit, has declared a 1½ per cent dividend to stockholders owning common stock of record at the close of business Aug. 10, payable Aug. 20.

**Ayres Elected an Officer in D. A. D. A.**

DETROIT, Aug. 5.—J. C. Ayers, of the Towar-Ayres Co. and Denby Motor Truck Co., was elected vice-president of the Detroit Automobile Dealers' Association at a meeting of that organization last week. He replaces George W. Franklin on the board, the latter having resigned on disposing of his automobile interests.

**General Motors Holds Export Convention**

NEW YORK, Aug. 5.—The first annual convention of the General Motors Export Co.'s executives, field men and department heads began on Aug. 1 and will be continued to Aug. 10. The program is very comprehensive, covering a series of meetings at the New York offices and also including a tour of educational inspection through the various factories at Detroit, Pontiac, Flint, Lansing and Jackson.

**U. S. Air Accidents Are Lowest**

WASHINGTON, Aug. 5.—The United States air service schools have a record, it is officially reported here, of a lower percentage of accidents and fatalities than those of the Allies or the central powers. The average is one man killed for every 3300 hours of flying. Following is the list of fatalities in actual flying sustained in this country from Sept. 1, 1917, to July 20, 1918:

Rank	Number
Officers .....	74
Cadets .....	65
Enlisted men .....	9
Civilian instructors .....	7
Total .....	155

United States schools, in attaining the present rating, have proceeded on the theory that three out of four deaths in flying at the front have been due to lack of judgment, and that but one man of four has been killed in action. Further, that if a cadet is given all his instruction in the flying schools in the United States he will put his preliminary air training out of mind when he finally reaches the front and concentrate entirely on fighting. Because of the fact that he has been perfectly trained as a "stunt" flyer, he will be the more able to pick up his fighting tactics quickly.

**Farmers Use More Trucks**

AKRON, Aug. 5.—According to statistics furnished by the B. F. Goodrich Rubber Co. farmers are the largest users of trucks, heading the list with a total of 79,789 trucks during the year 1917. These are engaged in the haulage of grain, produce, truck and livestock in the rural districts. Manufacturers have a total of 65,928 and retailers operate 64,486. According to the figures there are 238 commercial vehicle manufacturers in the United States, 90,000 trucks having been made in 1917 and it is estimated that the 1918 production will go over the 200,000 mark.

**Wisconsin Truck Starts**

OSHKOSH, Aug. 5.—The Wisconsin Duplex Automobile Co., Oshkosh, Wis., on August 1 began quantity production of a single type of 1½-ton commercial car employing a quadruple drive transmission system, which has been undergoing exhaustive tests for more than 70 years. Five trucks are now coming rough and the next group will be ten, actual increases being made until the regular group reaches twenty-five cars. According to William A. Besserdich, general manager, the company has commercial orders which will require its capacity well into 1919.

**Reliance Getting Ready**

APPLETON, WIS., Aug. 5.—The Reliance Motor Truck Co., Appleton, Wis., has its new plant in operation and the middle of August will be turning commercial chassis in quantity. The tire equipment of the former works at Racine, Wis., has been transferred to the shops.

**Body Builder Gets Boat Contract**

RACINE, WIS., Aug. 5.—The Racine G. Co., Racine, Wis., a large manufacturer of motor car bodies, has taken a government contract to build 500 metallic boats, fully equipped, for transports and new vessels of the United States emergency fleet. About 30 per cent of capacity will be devoted to the contract, deliveries on which are to begin September 1. The lifeboats will be 24 long with accommodations for forty persons and will be equipped with oars and a sail. Seats will run fore and aft as well as crosswise and will contain air compartments and lockers for medical supplies, oil, food, etc.

**Forms New Die and Tool Company**

BOWLING GREEN, OHIO, July 31.—The Bowling Green Die & Tool Co., a new organization, has effected the following organization: President, Clyde Urschel; vice-president, W. M. Gray; secretary-treasurer, Philo S. Hankey; manager, R. L. Swartz. These officers, with P. M. Davidson, form the directorate.

**Enlarge Fordson Plant**

DEARBORN, MICH., Aug. 3.—The plant of Henry Ford & Son is being engaged steadily to aid production on a large scale. A new tool room and a large addition to the stock room are under construction.

**Halladay Gets Cameron Buildings**

LEXINGTON, OHIO, Aug. 3.—The Halladay Motor Car Co. has purchased factory buildings of the Cameron Car Co., Attica, Ohio, and will occupy them October 1.

**New Truck Cab for Columbia Truck**

ONTIAC, Aug. 3.—A new truck cab will be manufactured by the Columbia Motor Truck & Trailer Co., which will be sold at \$150 extra. One of the features

## Current News of Factories

*Notes of New Plants—Old  
Ones Enlarged*

of the new device is that windows may be lowered, which eliminates the necessity for storing them. The window and the door drop out of sight, are securely fastened and do not rattle. If desired, the entire door can be taken off.

**Reorganize Derf Spark Plug**

NEW YORK, Aug. 3.—The Derf Mfg. Co. has been generally reorganized and W. Earl Clayton appointed general manager. Fred Gerken was named president of the company. The output is at present 1000 plugs a day and plans are being laid for increasing this during the next two months.

**Chicago Pneumatic Enlarges Plant**

CLEVELAND, Aug. 1.—The Chicago Pneumatic Tool Co. is erecting a three-story building adjoining its present plant at East Forty-ninth Street and Lakeside Avenue. The structure is to be 293 by 56, and will contain about 50,000 sq. ft. of floor space. The estimated cost of the addition is said to be \$150,000.

**State Fair to Include Automobile Show**

DETROIT, Aug. 3.—Detroit's dealers have purchased sufficient space to warrant the Michigan State Fair putting on its annual automobile show this fall. Secretary-Manager G. W. Dickinson announced that the show would be one of the features and will occupy the first floor of the Automobile Building. The second floor of the building has been taken over by the United States Government for a display of war materials, trophies from the European battlefields and other governmental exhibits that are of interest to the general public.

**Miller Sales at \$18,000,000 Rate**

AKRON, Aug. 4.—Sales of the Miller Rubber Co. are running at the rate of \$18,000,000 for 1918, compared with \$11,368,627 for 1917, \$7,583,606 for 1916, and \$3,150,595 for 1915. Earnings after war taxes were deducted for 1917 were equal to 24 per cent on the junior issue for preferred dividends.

**Detroit-Toledo Truck Line**

DETROIT, Aug. 3.—A motor truck freight and express line service between Detroit and Toledo is to be started by the H. C. Roberts Storage & Transfer Co., with daily service both ways. The service will start operation Oct. 1, and will carry freight to and from all cities and towns en route via the Rockwood and Monroe route.

**Milwaukee Home for Lavine**

MILWAUKEE, Aug. 5.—The Lavine Gear Co., Racine, which is erecting a complete new manufacturing group in Milwaukee, is completing arrangements for the transfer of its entire business from Racine to Milwaukee. The capital stock is being increased from \$100,000 to \$1,000,000 to provide for the general expansion of production and marketing of its line.

**Puritan Gets Argo Electric**

DETROIT, Aug. 3.—The Puritan Machine Co. has purchased the Service repair parts business of the Argo Electric Co., formerly of Saginaw, Mich. The entire stock of the Argo repair parts has been moved to Detroit.

**Cleveland Branch for Joliet**

JOLIET, ILL., Aug. 3.—The Joliet Oil Tractor Co. has opened a distributing office for Ohio at 1754 East 17th Street, Cleveland, which will do business under the style Bates-Steel-Mule Co. of Ohio. This office has been established to handle the new Model D Bates Steel Mule exclusively and will give factory service to all Ohio dealers and customers. A branch will be opened at Columbus to assist in distribution. It is the intention of the parent company to place a limited number of dealers in Ohio this year. Probably not more than twenty dealers will be appointed in 1918, as this number will take the entire quota for Ohio this season. Approximately one-half the quota has already been assigned.

**International Harvester to Dissolve**

WASHINGTON, Aug. 3.—The Department of Justice states that at the ensuing term of the Supreme Court the International Harvester Co. will dismiss its appeal from the decree of the District Court adjudging it a combination in restraint of trade and ordering its dissolution. The effect will be to leave the original decree of the District Court as the final decree in the case. In part the decree will compel the International Harvester Co. to dispose of the harvesting machine lines known under the trade names of "Osborne," "Milwaukee," "Champion," the trade names themselves, and all patterns, drawings, dies, blue prints, jigs and other machines and equipment used in the manufacture of those lines, to a responsible and independent manufacturer or manufacturers of agricultural implements. The company must also dispose of the plants and works at Springfield, Ohio, and Auburn, New York, where the Champion and Osborne lines are made.

If not otherwise disposed of in one year after the close of the existing war the above will be sold at public auction to the highest bidder. After December 31, 1919, the company will be prohibited from having more than one representative or agent selling agricultural implements in any city or town in this country.

## Hydro-airplane Base to Cost \$2,000,000

New Navy Department Training Base at Galveston Will Be Largest in U. S.

GALVESTON, Aug. 3—It is authoritatively announced that the hydro-airplane training base which the Navy Department will construct here will cost approximately \$2,000,000, and will be the largest in the United States. The proposed buildings, for which plans are now being drawn by L. B. Hyde, civil engineer in the Navy Department, will cover 60 acres.

Plans call for the erection of six hangars, built in two sections, and with accommodations for 24 hydro-airplanes. The hangars will be erected at the north-eastern part of the site fronting Galveston Bay. Each section will be 104 x 105 ft. in area and completely equipped for the housing of flying machines. Each section of the hangars will be provided with a landing pier 200 ft. in length. To the south of the hangars will be the machine-shops and repairshops.

A considerable portion of the site will be devoted to the ground school, where student aviators will receive preliminary training.

An observation tower, 120 ft. in height, will be erected, from which the officers in charge of training may have a good view of the flyers in training and observe the character of their work.

There will also be an office building and an administration building, each two stories high.

The building to be used as quarters for the officers and student aviators also will be a two-story structure, somewhat in the shape of a letter H. The ground floor of one side of the building will be devoted to the recreation room, dining room, kitchen, store room, refrigerators, etc. The remainder of the building will be quarters, with each bedroom 10 ft. 6 in. by 12 ft. 6 in.

Barracks for several hundred men, with mess hall and other necessary equipment, will be provided, as well as a dispensary.

### Dayton-Wright Ships 1000th Plane

DAYTON, Aug. 1—The Dayton-Wright Airplane Co. shipped yesterday its 1000th airplane, and commemorated the event by giving its employees a holiday to-day. The average daily production of the company is twenty.

### It's the "Air Service" Now

WASHINGTON, Aug. 2—Hereafter "Air Service" will be the general term used to denote either the Division of Military Aeronautics or the Bureau of Aircraft Production. Officers and enlisted men will be known as members of Air Service, Military Aeronautics or Air Service, Aircraft Production, as the may be. The chief of aircraft pro-

duction will hereafter be known as the Director of Aircraft Production. The chief of the Division of Military Aeronautics will be known as the Director of Military Aeronautics.

### Name Four New Flying Fields

WASHINGTON, Aug. 3—Four new flying fields in the neighborhood of Hazelhurst Field, Mineola, Long Island, have been completed and named after aviators who died in the service. They are under the command of Major C. K. Reinhart, J. M. A. The field at Wantagh, L. I., has been named Lufbury Field in memory of Major Raoul Lufbury. Field No. 2 at Mineola, L. I., is now known as Mitchel Field in honor of Major John Purroy Mitchel. The field near Babylon, L. I., is named the Henry J. Damm Field in memory of Lieut.-Col. Henry J. Damm. The field at Commack, L. I., is designated Brindley Field in memory of Major Oscar A. Brindley.

### Mail Flight Records Broken

WASHINGTON, Aug. 2—The air mail service records were broken yesterday. Major C. K. Phinehart flew from Mineola, L. I., to Washington in 2 hr. and 15 min. Another extraordinary flight was made when Lieut. Killgore left Philadelphia at 1.25 p. m. in a severe rainstorm and reached Washington on schedule time at 3 p. m. Lieut. Killgore broke his goggles and was compelled to fly the entire distance without protection for his eyes. He flew at a height of 1500 ft. entirely by compass. Thus far storms have not interfered with the air mail service.

### De Haviland "Scandal" Exploded

WASHINGTON, Aug. 1—Another airplane "scandal" rumor exploded harmlessly yesterday when Secretary Baker specifically denied newspaper reports that the De Haviland plane production was held up. There was no official foundation for the rumor. The rumors told that General Pershing had requested complete halt of the De Haviland production and pointed out many serious faults. There is apparently foundation for the statement that General Pershing recommended some changes in the De Haviland plane, but this is about all the truth which the reports contain.

### Tries Dropping from Moving Plane

PARIS, FRANCE, July 30—What is believed to be the first experiment of falling from a moving airplane with a parachute has been successfully carried out by Captain Sarret, a French aviator. He dropped 800 meters with a parachute 12 yards in diameter and landed safely.

### To Conserve Chains

WASHINGTON, Aug. 1—A campaign of education is planned by the War Service Committee of chain manufacturers for the conservation of chains. Members of the committee are: C. M. Power of the American Chain Co.; Staunton B. Peck, Link-Belt Co., and A. B. Way, Bridgeport Chain Co.

## Deaf Mutes Won't Make Good Fliers

Official Tests Show That They Lack the Necessary Qualifications

WASHINGTON, Aug. 3—Numerous reports that because of lack of dizziness deaf mutes would make good fliers are denied here to-day by the Division of Military Aeronautics. An erroneous idea persistently circulated about the country has led hundreds of deaf mutes to believe that they were desired as fliers in the Army and many have sought enlistment.

Two investigations were started three weeks ago because of these unauthorized reports, one to determine the source, and the other to make special tests of accuracy of deaf mutes in sensing motion.

The first investigation is not yet finished. The second investigation completed by the Medical Research Laboratory at Mineola, L. I., included tests in flights to ascertain what effect the absence of the delicate balancing apparatus that exists in normal inner ears has upon persons who are without them.

Normal men and deaf mutes were flown at different times blindfolded. The flights included level flying, climbing, left and right turns, dips and banks. The passengers were asked to record the directions. The deaf mutes failed completely. They could not even note changes of 90 degrees. Normal passengers reported changes as slight as 5 degrees. Consequently the individual with less sensitivity to a change of position is really less efficient in the air.

### Acme Motor Truck Enlarges Plant

CADILLAC, MICH., Aug. 3—The Acme Motor Truck Co. has increased the size of its plant considerably. The following additions have been built this summer: A woodworking and body shop, 65 by 80; an addition to the assembly building, 65 by 96; a heating and power-plant, 46 by 80; an office, 80 by 118; two washrooms, 12 by 30, and a dining room, 13 by 46. Another addition to the body department is contemplated in the very near future, which will be 65 by 80.

### Motor Trucks to Transport Hogs

WASHINGTON, Aug. 3—The number of hogs transported to the Omaha market by motor trucks during the first six months of 1918 has increased 180 per cent over the corresponding period in 1917. This furnishes an example of how motor trucks are relieving railroad transportation. The number carried in this way amounted to 92,780 for the period in 1918 as compared with 33,084 for the corresponding months last year. Estimating 70 hogs as an average carload in railroad shipments, the number delivered by motor trucks on the Omaha market during the first six months of 1918 aggregated more than 1300 carloads, or an average of more

than 8 carloads for every market day during the period.

The motor truck business is becoming so important that commercial organizations of Omaha are taking active measures to utilize the trucks on return trips to country points for hauling various kinds of freight. Experience has shown that motor truck marketing is as feasible in winter as in other seasons, as more than 26,000 hogs were delivered directly from farms to the Omaha market during January and February.

#### Dependable Gets a Building and Site

GALESBURG, ILL., Aug. 3—The Dependable Truck & Tractor Co., recently organized here, has purchased a 5-acre tract of land which has on it an abandoned factory building with 65,000 sq. ft. of floorspace. The old structure will be rebuilt and will be utilized for assembling trucks. In addition, a new building will be constructed with a floorspace capacity of 40,000 sq. ft.

#### Ordnance District for St. Louis

WASHINGTON, Aug. 1—The Ordnance Department has established a new production district to be known as the St. Louis Production District. Headquarters will be at St. Louis. M. E. Singleton of that city is the ordnance district chief. Division of the country into production districts was undertaken by the Ordnance Department as part of its plan of decentralization and in order to promote more rapid and efficient methods of carrying out the enormous ordnance program. Under this system the production work in each district is under its own responsible head, who is answerable directly to the Ordnance Department in Washington.

#### Harroun's Patent Allowed

WAYNE, MICH., Aug. 5—Ray Harroun, vice-president of the Harroun Motors Corp., has received notice from the patent office that his claim for exclusive rights to the shock absorbing steering wheel in use on all Harroun cars has been allowed. His patent has been transferred to the company.

#### Automobile Body Plant Burned

BOSTON, Aug. 5—The big plant of the Sargent & Ham Company, manufacturers of automobile and carriage bodies on Sudbury Street, was gutted by fire this morning, the loss being approximately \$60,000. There were a number of finished and nearly finished automobile bodies on the floors, and they will be practically a total loss. The structure was six stories and the upper floors were destroyed so that the roof fell in, carrying away the two upper floors. Several firemen had narrow escapes from injuries. The fire started about 1 in the morning, and so there were no workmen in the building. It is believed that it was caused by spontaneous combustion.

## Government Wants to Protect Labor

### Detroit Manufacturers Asked to Protect Skilled Help by Aiding in Obtaining Exemption

DETROIT, Aug. 5—At a meeting called by the ordnance and aircraft sections of this territory the government representatives emphasized again and again the necessity for manufacturers to protect their skilled men. Unless every manufacturer of munitions secures deferred industrial classification in the draft for every man in his employ necessary to production, he is acting unpatriotically, according to the Government representatives. Not only will the manufacturer suffer, but the Government will be injured in its prosecution of the war.

Eight hundred and seventy-five manufacturers of Detroit working on war material were present. The ordnance division was represented by Fred Robinson and the aircraft section by T. P. Myers. Judge James Murfin represented the district board of the selective service and R. K. Davis the adjutant general's office. Allan A. Templeton, advisor of the survey and conversion sections of the War Industries Board, presided at the meeting.

Mr. Templeton stated that the Government wants all manufacturers to give it every man that they can spare, but the Government does not want them to send a single man into the army whose loss to the manufacturer would delay the production of war materials. Rather, the Government wishes to help all manufacturers to save their important and necessary men. He expressed the thought that they would not be really patriotic unless they did as the Government directed them in this matter.

Mr. Robinson, in charge of the ordnance department production in this district, declared that there is in this country, at the present time, a shortage of skilled labor of more than 250,000. This is felt most acutely in the East and Detroit has not suffered greatly owing to the fact that men from automobile factories, which have curtailed production, have drifted into war industries. The time is coming, however, when the supply of these men will cease and Detroit manufacturers will be in the same extremely serious situation as is the East to-day. More finished products for the ordnance department are made in this district than in any district in the country, and the total output is greater than any district with the exception of Pittsburgh, with its large steel production.

It was announced at the meeting that an industrial relations department of the aircraft service is being perfected to handle the problems of securing labor, handling disputes, settling industrial unrest, etc. It is believed this section will be in operation within 30 days.

R. K. Davis, speaking as a representa-

tive of the adjutant general, said: "We want every manufacturer of war materials to get deferred classification on its skilled men—men necessary to their production. We also want the manufacturers to be reasonable in their demands, and not try to secure deferred classification for bookkeepers, stockkeepers and the like."

#### To Tabulate Results of Conservation Movement

DETROIT, Aug. 5—Many retailers are co-operating with the Wholesale Merchants' Bureau in the latter's campaign for conservation of truck time and man power. Over 125,000 cards and circulars requesting co-operation in every way possible to make this movement a success have been sent them. Placards on delivery trucks are now being used by a large number of wholesale merchants. The campaign was started by the Wholesale Merchants' Bureau in an effort to show the absolute necessity, under present war-time conditions, of conserving man power and truck time. In order that this may be accomplished it is essential that all avoidable delays in receipting for goods be eliminated. Efforts are now being made to arrive at some definite figures showing the actual truck time saved by each wholesaler as a result of this movement.

#### Gardner's Interest in St. Louis Chevrolet Sold

ST. LOUIS, Aug. 5—Russell E. Gardner has disposed of the interest of himself and two sons in the Chevrolet Motor Co. of St. Louis because his sons, Russell E. Gardner, Jr., sales manager for the company, and Frederick Gardner, production manager, had entered the service of the United States Navy. Gardner did not name the purchaser, but it has been understood here that the General Motors Co. had an option on the Gardner stock for \$1,000,000. The giving of the option was announced at the time of the purchase of 105 acres here for a body factory and assembly plant for the General Motors. The deeds for this land were completed last week. The Gardners became interested in the Chevrolet company when they turned their large buggy factory into a body building plant.

#### Conaphores on Pierce-Arrows

NEW YORK, Aug. 2—The Edward A. Cassidy Co. announces that the Pierce-Arrow Motor Car Co., Buffalo, has adopted the Conaphore headlight lens, manufactured by the Corning Glass Works, Corning, N. Y., as standard equipment on its passenger cars.

#### Moto-Meter Equipped Tractors at Salina

NEW YORK, Aug. 1—Eighty-two per cent of the tractors taking part in the demonstration held at Salina, Kan., were equipped with the Boyce Moto-Meter.

# Industrial Review of the Week

## A Summary of Major Developments in Other Fields

### Coal Output Drops Slightly; Alarming Shortage Not Likely

Production has dropped off slightly from the high records of the recent past. This diminution in the output is, however, not particularly serious and if the present rate can be maintained there can be no such suffering for want of coal as the country experienced last winter.

The coal supply problem is still one of transportation rather than production. It has been fairly well demonstrated that if the mines are supplied with cars they are, as a general rule, able to turn out a heavy output and one well up to the needs of the country. One or two roads have had such heavy traffic in coal that much congestion with some wrecks and derailments has resulted.

In the West and Middle West production is well up to the demand and certain grades and sizes are still selling below the Government schedule. In the East, however, particularly along the Atlantic Seaboard, demand is strong and dealers are unable to accumulate any stocks except of one or two of the smaller sizes. Of these there is now a slight surplus, but it is questionable if this would be maintained were bituminous coal available with which to mix the fine anthracite.

One incident of the week, small in itself but which may be far-reaching in its results, was the closing of four small mines in the Pittsburgh district because they shipped dirty coal. It is evidently the intention of the Fuel Administration to tolerate no such practices in this respect as caused such justifiably adverse criticism of the industry as was heard last winter.—*Coal Age*.

### Mix-up in Sunday Closing Plan

WASHINGTON, D. C., Aug. 6.—There is somewhat of a mix-up regarding the Sunday closing plans, which are part of the War Service Recommendations of the National Automobile Dealers' Association, because of a joint statement issued by the Fuel Administration and the War Industries Board to the effect that there has been no governmental order or recommendation against the sale of gasoline on Sunday.

Until further conference by the parties concerned it is not possible to make a definite statement as to the outcome.

The Sunday closing is a part of the dealers' recommendations as a means for conserving labor and not gasoline. Opposition was met in several towns on the part of the big oil companies which operate their own filling stations and have a large Sunday business.

The dealers' recommendations were outlined last winter after the dealers had been

called to Washington by Chairman A. W. Shaw of the Conservation Division of the War Industries Board, as were many other trades, and asked to make economies in the automobile trade. The recommendations followed, their chief object being the conservation of labor through reducing certain of the dealers' activities.

Following the statement of the Fuel Administration and the War Industries Board, which has upset the plans of the dealers in many sections, the Conservation Division has issued a statement which throws little light on the possible outcome of the matter.

President F. W. A. Vesper of the N. A. D. A., who is also chairman of the dealers' War Service Committee, is to confer with the Conservation and Fuel bodies this week in an effort to get a definite understanding as to whether the oil companies are willing to co-operate with such local associations of dealers as wish to conserve labor through Sunday closing.

### Wire Wheel Corp. Makes Government Agreement

NEW YORK, Aug. 3.—By virtue of a license agreement just entered into between the government and the Wire Wheel Corp. of America the whole ownership of the Pugh triple lacing patent is acknowledged by the former and the corporation grants the government the right and power to make, use and sell wire spoked wheels embodying the invention in the United States, its territories and dependencies during the present war and for a period of three months after peace is declared. The corporation has given the government the right to sub-license others to make for and sell to the government wire spoked wheels embodying this invention. These sub-licenses will be non-transferable and will not permit the manufacture of wheels except for the government. The government will pay the Wire Wheel Corp. a royalty on each wheel and will keep it informed of the names of the sub-licensees and details governing the issue of the sub-licenses.

### Jordan Pays Dividend on Preferred Stock

CLEVELAND, Aug. 5.—The Jordan Motor Car Co. on Aug. 1 paid a dividend of 8.6 per cent to the holders of the original preferred stock. It is stated that the company has been turning over its capital practically every 30 days and that in July its earnings were at the annual rate of 160 per cent on the capital invested.

### Frankfurter on Priorities Board

WASHINGTON, Aug. 7.—Felix Frankfurter, chairman of the War Labor Policies Board, has been appointed a member of the Priorities Committee of the War Industries Board, on which he will represent the Department of Labor.

### Coal, Coke and Labor Are Factors in Steel Production

In respect to steel supply and demand, the outcome of the week has been, first, a decision by the War Industries Board averse to creating the additional reservoir of ship steel asked for by Director-General Schwab; second, the gathering of data showing that the 33,000,000 tons of finished rolled steel which has been taken as the present annual capacity of the country is considerably too low. In one stretch of five weeks, chiefly in May, it is shown that the rate was close to 38,000,000 tons of finished products per year.

It appears that the ship steel in process or in stock at shipyards and fabricating plants amounts to about 1,000,000 tons. While the War Industries Board did not consent to increase the present shipments of 50,000 tons a week of ship plates by 20,000 tons a week through the next quarter, or even by the 10,000 tons a week later asked for, its members are confident there will be no break in the shipbuilding program for lack of steel.

### Steel Production Increase Studied

The deciding influence in the matter was the fear of members of the board that the impounding of additional definite tonnage for ship purposes might mean the suspension of small but in the aggregate important private industries.

Ways and means of increasing steel production have been carefully studied. But coal and coke labor are still the key, rather than extensions of rolling-mill capacity. So far as the latter is concerned, probably 1,000,000 tons more will be ready by Jan. 1, chiefly in plates, but partly in large rounds, the Steel Corporation now having a \$750,000 mill for this purpose under construction in the Pittsburgh district.

### Merchant Furnaces Increase Output

The statistics for last month show that to increase pig iron output is no easy matter. In the 31 days of July the make was 3,420,988 tons, or 110,354 tons a day, against 3,323,791 tons in June, or 110,793 tons a day. The merchant furnaces increased their output nearly 2000 tons a day as compared with June, while the steel works furnaces fell off nearly 2500 tons a day.

August humidity may bring down production, and probably will, but an increased rate would otherwise result from the blowing in of additional furnaces. The active list shows a net gain of 8 in July. The number in blast Aug. 1 was 364, with an estimated daily capacity of 112,600 tons against 356 on July 1 with a daily capacity of 111,130 tons.—*Iron Age*.

## Aircraft Production Purchases

WASHINGTON, Aug. 2—The following is a list of purchases contracted for by the Air Service, Aircraft Production:

Dyneto Electric Corp., Syracuse, N. Y., 100 battery charging sets.

Eastman Kodak Co., Rochester, N. Y., 12,-600 dozen commercial plates.

Eastman Kodak Co., 750 gross process films.

Austin Mfg. Co., Harvey, Ill., 1 motor sweeper and supplies.

Dominion Asbestos & Rubber Co., 154 Nassau Street, New York City, 1380 sheets asbestos.

American Bleached Goods Co., New York City, N. Y., 90,000 yards balloon cloth.

Hawkeye Division, Eastman Kodak Co., Rochester, N. Y., 25 aerial lenses.

United States Lens Co., Geneva, N. Y., 1200 negative lenses.

July 5, 1918

Ward Leonard Electric Co., Mount Vernon, N. Y., 200 battery charging panels.

Brown & Sharpe Mfg. Co., Providence, R. I., 1 universal and tool-grinding machine.

American Bleached Goods Co., New York City, N. Y., 15,000 yards balloon cloth.

The Anderson Chemical Co., Wallington, N. J., 2000 gallons diacetone alcohol.

July 6, 1918

Brown & Sharpe Mfg. Co., Providence, R. I., 1 tool-grinding machine and attachments.

American Cellon Co., 887 Fifth Avenue, New York, N. Y., 50,000 gallons cellulose acetate dope.

Napier-Browning Co., 105 West Fortieth Street, Jersey City, N. J., 6100 connectors.

July 8, 1918

Bell & Howell Co., Candler Building, 220 West Forty-second Street, New York, N. Y., motion picture equipment, cameras, lenses, etc.

General Radio Co., 11 Windsor Street, Cambridge, Mass., 2500 receiving sets.

Geo. H. Amick, Clendenin, W. Va., 50,000 feet walnut lumber.

Guy Leonard, Baltimore, Md., services as supervisor of construction and operation of plants manufacturing acetate of lime and other chemicals.

July 9, 1918.

Western Electric Co., 463 West Street, New York City, 280 amplifiers, 300 transmitting sets.

Murray & Tregurtha Co., 340 West First Street, South Boston, Mass., 2 sealeads and motors.

Chemical Products Co., 30 Charles River Road, Cambridge, Mass., 42,000 pounds cellulose acetate.

Champion Ignition Co., Flint, Mich., 15,000 spark plugs.

Simmons Hardware Co., District National Bank Building, Washington, D. C., 5000 gunners' safety belts.

Lewis Thompson & Co., Colonial Trust Co. Building, Philadelphia, Pa., 25,000 feet Mexican mahogany lumber.

Canadian Aeroplanes (Ltd.), Toronto, Ontario, Canada, 150 planes for Curtiss Canadian airplanes.

Ericsson Mfg. Co., Buffalo, N. Y., 95 items, spares for Ferling magneto D-81, contact springs, screws, interrupter levers, etc.

American Proveler & Mfg. Co., Baltimore, Md., 1000 air fans.

July 12, 1918

Century Telephone & Construction Co., Buffalo, N. Y., 109 instruction buzzer sets.

Century Telephone & Construction Co., Buffalo, N. Y., 50 instruction buzzer sets.

Russell, Burdall & Ward Co., Port Chester, N. Y., 37,000 galvanized lag screws.

## Contracts

The Dow Chemicals Co., Midland, Mich., 15,000 pounds cellulose acetate.

The Celluloid Co., 30 Washington Place, New York City, 25,000 pounds triphenyl phosphate.

National Pneumatic Co., 50 Church Street, New York City, interrupter gear parts—Bowden wire controls, 300; copper pipe lines, 400 sets; trigger motors complete, 1200; generator pistons with plungers, 1800; reservoirs complete, 240.

Curtiss Aeroplane & Motor Corp., Buffalo, N. Y., spares for JN4-D planes, ailerons, 6; engine bed crossbars, 13; control wires complete, 50 sets; wing masts, landing gear struts, etc.

Curtiss Aeroplane & Motor Corp., Buffalo, N. Y., ailerons, control wires, windshield, wing masts, landing gear struts, turnbuckles, control pulleys, bolts and nuts, etc.

Phoenix Furniture Co., Grand Rapids, Mich., 500 Handley-Page propellers.

Goodyear Tire & Rubber Co., Akron, Ohio, tape, tubes, rubber cores, fabric rollers and stitchers.

July 17, 1918

Western Electric Co., 463 West Street, New York City, telephone material, extension bells, lamp caps, condensers, mouthpieces, plugs, receivers, etc.

Western Electric Co., 463 West Street, New York City, services development of two high power output amplifiers.

Western Electric Co., 463 West Street, New York City, telephone supplies, cords, resistance lamps, test boards, switchboard lamps, etc.

General Electric Co., Schenectady, N. Y., 868 tripods, 620 of same being 11 ft., 248 of same being 6 ft.

Singer Sewing Machine Co., New York, N. Y., 125 2-needle, 3/4-in. gauge sewing machines.

National Gauge & Equipment Co., La Crosse, Wis., 2500 oil-pressure gauges.

Cunningham Son & Co., Rochester, N. Y., 30 windlasses.

## Contracts for the Marine Corps

WASHINGTON, Aug. 2—Contracts have been placed by the Quartermaster of the United States Marine Corps as follows:

July 22, 1918

Packard Motor Car Co., Detroit, Mich., chassis and equipment.

Morris Truck & Wheel Co., Philadelphia, Pa., truck wheels.

July 23, 1918

Standard Oil Co. (N. J.), Baltimore, Md., gasoline and fuel oil.

July 24, 1918

The Holt Mfg. Co., Peoria, Ill., tractor.

July 26, 1918

Donovan Motor Car Co., Boston, Mass., truck.

## Not to Fix Minimum Wage Rate

WASHINGTON, Aug. 3—The National War Labor Board has decided not to establish a minimum wage rate to be applied to industry generally throughout the country.

## Ordnance Contracts

WASHINGTON, Aug. 3—Contracts were placed by the Ordnance Department of the U. S. Army, as follows:

Remington Typewriter Co., New York; models of bomb release mechanism.

Edward G. Budd Mfg. Co., Philadelphia; airplane flares.

Four-Wheel Drive Auto Co., Clintonville, Wis.; spare parts for 3-ton truck, equipment and main shaft for ammunition trucks.

B. F. Goodrich Co., Akron; rubber equipment for heavy artillery repair shop.

Cleveland Twist Drill Co., Cleveland; small tools for mobile repair shops.

Warner Auto Top Co., Cincinnati; pack carriers, breech lock mechanisms.

Nash Motors Co., Kenosha, Wis.; repair parts for Nash "Quad" trucks.

## To Encourage Rural Truck Routes

WASHINGTON, Aug. 3—Arrangements have been made whereby rural motor truck operators can co-operate with the Bureau of Markets in developing rural truck routes for farm products. Operators of trucks who comply with certain requirements of the bureau will receive assistance in building up business in farm produce, and will receive a sign to display on their machines stating that they are co-operating with the Department of Agriculture. Truck operators can get details of the plan by writing to the Bureau of Markets, Washington, D. C.

## To License Exports for Mexico

WASHINGTON, Aug. 3—The War Trade Board will now consider applications for licenses permitting the exportation to Mexico of numerous commodities. It will be especially liberal in granting licenses for Agricultural machinery, and will license freely articles of steel and iron manufacture which will be used in Mexico for producing war material for the United States.

## Transport Truck Elects Directors

MT. PLEASANT, MICH., Aug. 3—At the stockholders' meeting of the newly formed Transport Truck Co., the following board of directors was elected: H. E. Chatterton, chairman; A. E. Gorham, W. D. Hood, E. J. McCall, C. E. Hagan, Attorneys Warner and Milton A. Holmes. The new company will manufacture internal gear drive trucks immediately. Although the new factory will probably not be finished for 90 days or more, construction of 1½- and 2-ton models will begin immediately at another factory, with an output which will probably reach four or five a day by Sept. 1.

# THIS 3 MINUTE PATCH CUTS TIRE COSTS

**I**f you'll carry a box of Johnson's Hastee Patch in your tool kit you can get away from the expense of a lot of spare tubes and casings which fast deteriorate during the hot motoring months. A box of Johnson's Hastee Patch in your car answers the same purpose as two or three extra tubes and casings. And there is a saving of 23c over garage vulcanizing on your smallest patch and much more on your large ones.

## JOHNSON'S HASTEE PATCH

Johnson's Hastee Patch gives equally good results on a pin hole puncture or on a large blow out. It is conveniently put up in strips so the user can cut just the right size patch for each repair. With it the most inexperienced motorist can easily, satisfactorily and inexpensively patch his own tires. No time, labor or heat required. The patch can be applied in three minutes—at a cost of 2c and the tire is ready for instant use at any speed.

Johnson's Hastee Patch is not a make-shift—it permanently mends tubes and casings. It is much more satisfactory than vulcanizing because there is no danger of burning and spoiling the tube. The heat from the road does the vulcanizing.

If your dealer cannot supply you use attached coupon.

AND IT'S ON TO STAY

**S. C. JOHNSON & SON**  
I enclose 50c for which please send me by prepaid Parcel Post a 50c package of Johnson's Hastee Patch which I understand is sufficient for 25 average size patches. Satisfaction guaranteed or my money back. Also send me free your booklet on "Keeping Cars Young".

## THE AUTOMOBILE

VOL. XXXIX

NEW YORK—THURSDAY, AUGUST 15, 1918—CHICAGO

No. 7

## Steel Decision Held Up By Delayed Inventories

Threatened 100 Per Cent War Program Apparently Due to  
Failure of Manufacturers to File Steel Inventories Promptly

### WAR BOARD REFUSES OFFER OF CAR MAKERS FOR 50 PER CENT REDUCTION FOR 1919

**W**ASHINGTON, D. C., Aug. 14—The offer of the automobile makers to cut passenger car production 50 per cent for the year beginning August 1, 1918, as agreed upon at the meeting of the N. A. C. C. members in Detroit August 6 was not accepted favorably by the War Industries Board, which Board has answered the offer of the automobile makers by declaring that at this time it can not make any promises whatsoever regarding the supplying of steel, rubber and other materials to the automobile industry covering any definite period in advance.

The reason given for this reply is that at present it looks as if there will be little if any of the principal materials needed in the construction of a passenger automobile available for non-war industries after the war requirements have been taken care of.

The War Industries Board in its reply to the N. A. C. C. intimated that it was disappointed in not having received from the automobile makers the sworn inventories showing the quantities of different grades of steel on hand, and with which the War Industries Board hoped to arrange some plan for a balancing of inventories as far as possible.

At present perhaps 50 per cent of these inventories have been forwarded by the companies and there have been some delays with the others. Because of this the War Industries Board in its letter to the N. A. C. C. stated that no steel will be furnished automobile makers until they have filed with the board these sworn statements coupled with an agreement that the makers will

furnish to the Board any such additional information from time to time as it may require.

The War Industries Board holds out a moiety of hope against the 100 per cent reduction which it urged automobile manufacturers to make when it adds in its letter that as soon as it receives the sworn statements regarding inventories it will take appropriate action on them and immediately advise the makers.

The shortage of steel, rubber and other materials seems to be so acute in the estimation of the War Industries Board that it has urged the automobile manufacturers to undertake to get on a 100 per cent war basis by January 1, 1919, and adds that in no other way can the makers be sure of the continuance of the industry and the preservation of the organization.

The complete text of the reply of the War Industries Board to the offer of the N. A. C. C. is published herewith.

This letter from the War Industries Board was a complete surprise to the automobile makers, as well as to Hugh Chalmers, who had represented the N. A. C. C. before the Board. Only two days before this urging of automobile makers to get on a 100 per cent war basis not later than January 1, 1919, was announced in the letter, Mr. Chalmers waited on the Board and laid before it the offer of the automobile makers to make a 50 per cent cut in production for the year beginning August 1, 1918, as compared with 1917 production. In his hearing before the Board there was no intimation that the Board was contemplating any further action until it passed on

the various sworn statements on inventories of the companies. The present announcement given generally to the press has created a great amount of unrest and uncertainty throughout the industry, particularly as there is nothing definite as to what the board will do until it receives the inventories, when, according to its letter, it will take appropriate action and advise the industry.

It seems most unfortunate that such a conflicting atmosphere should have surrounded this entire matter, and doubly unfortunate that any such drastic announcement should have been made before the inventories which were asked for on July 16 should have been passed upon. It was expected that nothing of this nature would take place—in fact, such was the general understanding on the subject.

When Mr. Chalmers left his meeting with the War Indus-

tries Board he was certain some aid would be given the industry in securing steel. On the other hand, the War Industries Board, following Mr. Chalmers' departure, issued a statement informing the industry that it can only be assured of its continuance by conforming to the board's desire and going on a 100 per cent war work program.

The board does not explain how the passenger car manufacturers can continue business if they take on 100 per cent war work leaving .000 per cent organization and facilities for car manufacture. Neither does it tell the manufacturers how to secure 100 per cent war work. Presumably it leaves these puzzles to be solved by the industry.

Mr. Chalmers came to Washington Thursday to inform the War Industries Board of the unanimous vote of the N. A. C. C. to curtail passenger car production 50 per cent as com-

## Full Text of War Industries Board Statement Regarding Steel Curtailment

**T**HE sub-committee appointed Thursday, August 8, with full power to act for the War Industries Board concerning the output of automobiles, makes known its position in the following letter to the National Automobile Chamber of Commerce:

NATIONAL AUTOMOBILE CHAMBER OF  
COMMERCE,

7 East 42d Street,  
New York City.

Gentlemen:

We are in receipt of and have given very careful consideration to your communication of August 8, embodying the resolutions passed at your meeting at Detroit, Tuesday, August 6. We note that the manufacturers have voluntarily agreed among themselves to curtail the production of passenger cars 50 per cent. While this is clearly a step in the right direction and furnishes a basis for each and all of the manufacturers, without further delay, to make appropriate reductions in selling, general and overhead expenses, still it is only a step, and further curtailment is inevitable. Fairness to your industry impels us to state frankly that the situation as it is presented to us to-day indicates very clearly that there will be little, if any, of the principal materials required in the construction of passenger cars available for non-war industries after the war requirements shall have been provided for, and the War Industries Board cannot at this time make any promise whatsoever regarding the supply to your industry of steel, rubber or other materials for any definite period in advance. We strongly believe that it is to the best interest of your members and all other manufacturers of passenger automobiles to undertake to get on 100 per cent war work as

rapidly as possible and not later than January 1, 1919, for in no other way can you be sure of the continuance of your industry and the preservation of your organization.

We regret that we are not in a position at this time to give you a more definite reply to your communication of the 8th instant due to the fact that the data and information which on July 16 we requested you to promptly furnish us have not yet been received. As soon as received prompt and appropriate action will be taken, of which you will be immediately advised.

No material will be furnished to any passenger automobile manufacturer until it has filed with this Board a sworn statement embodying the information requested on July 16 coupled with an agreement to furnish this Board with such additional information from time to time as it may require.

Yours very truly,  
WAR INDUSTRIES BOARD.

At a meeting of the War Industries Board on Thursday, representative of the National Automobile Chamber of Commerce presented resolutions adopted at Detroit in which the manufacturers of automobiles voluntarily agreed to cut their production 50 per cent beginning with August of this year. Reference in the above letter to the request made on July 16 for certain information from the automobile manufacturers relates to the inventories of the steel which each manufacturer had on hand at that date.

with 1917. He also presented a pledge which the manufacturers are willing to give. The N. A. C. C. meeting and the resolution were the result of a conference early in July between Mr. Chalmers and the War Industries Board, when Bernard Chalmers, chairman of the board, suggested that the manufacturers should get together and determine what would be the maximum curtailment. In voting a 50 per cent cut the manufacturers reached what they think is the largest curtailment compatible with industrial conditions and which they will allow retention of organizations and operation during the emergency.

#### Committee Appointed

Chalmers, after his arrival here, held four conferences with members of the War Industries Board. At the Thursday morning he presented the resolution of curtailment and the tentative pledge. At this meeting a committee was appointed by Mr. Baruch which comprises Alexander Legge, Requirements Division; Judge Ed-ward Parker, Priorities Board; George N. Peek, Finished Goods Section, and J. Leonard Replogle of the Steel Section of the War Industries Board, to deal completely with matters regarding the automobile industry.

During the two conferences of the first day, Mr. Chalmers stated that nothing definite had been done beyond the adoption of the resolution and curtailment. His statement contrasted with the rather noncommittal statement issued late in the day by the War Industries Board, as follows:

"Mr. Chalmers, representative of the National Chamber of Commerce, appeared to-day before the War Industries Board and presented resolutions adopted unanimously by the automobile manufacturers at a special meeting in Detroit. By these resolutions the manufacturers volunteered to curtail the production of passenger cars 50 per cent beginning Aug. 1. Mr. Chalmers also presented a form of pledge which the automobile manufacturers agreed to make concerning their output. The War Industries Board has appointed a committee with full power to act on the matter of automobile production."

On the second day here Mr. Chalmers stated that confer-

ences with the War Industries Board had been highly satisfactory. The board, he said, welcomed the co-operative spirit displayed by the manufacturers and was attempting to meet that spirit in turn. The 50 per cent curtailment figure was accepted by the board, said Mr. Chalmers, as a regulatory figure by which the manufacturers might guide themselves in making reductions in overhead, inventories and other similar expenses. However, he added, the board did not promise to provide steel to meet this figure. The situation, though, appeared optimistic. The meetings of Mr. Chalmers with the small sub-committee allowed for close, friendly and open discussion of the various problems connected with the curtailment. Such matters as the British complete curtailment of passenger car manufacture were brought up and discussed and explained. The difference between the Ford Motor Co., which has \$400,000,000 worth of war work and other smaller passenger car manufacturers unable to secure the war work was clearly defined.

#### Friendly Spirit Shown

When interviewed after his meeting with the board Mr. Chalmers said that no decision had been arrived at and that none would be until after all of the inventories of steel now being compiled by the manufacturers were received in Washington and checked by the War Industries Board, following which definite decisions regarding the allotment of steel to the industry would be made. Mr. Chalmers emphasized the exceedingly friendly spirit by which he had been met by the board, and was certain that all that could be done would be handled in a broad spirit by the board at the next conference, which is to take place in about 10 days. Asked if the board would issue any further statement, Mr. Chalmers said that this was answered in the negative, saying that there was nothing further that the War Industries Board could say at this time.

After Mr. Chalmers left Washington the War Industries Board addressed a letter to the New York office of the N. A. C. C. urging that the industry get on a 100 per cent war work basis. This letter, together with comment, was issued to the general press.

## Fighting Motor Trucks on the Italian Front

An Italian anti-aircraft battery operating on the Corso. The Italians, from the very beginning of their participation in the war, have been extensive users of motor-propelled apparatus, and because of the mountainous character of the country through which their battle lines run they have benefited greatly thereby.

# Possibilities for Standardization in Tractor Front Axles

Each Manufacturer Now Compelled to Design and Make His Own, With Resulting Variety of Type and Increased Cost of Production—A Few Standard Designs Would Meet All Requirements

*Arch type of built-up axle*

*Bolster bracket carried on axle*

*High bracket between axle and frame to give height for the rear end*

**W**HAT should be one of the easiest tractor problems to solve is the design of the front axle, and of all the components of a tractor there is hardly one which lends itself more to standardized or specialized manufacture. However, there are no signs as yet that tractor makers are getting their front axle designs from axle manufacturers, for hardly any two tractor front axles are similar in shape, and much less in dimensions.

The divided or Ackerman steering axle is now used on the great majority of tractors, though a few makers still stick to fifth wheel steering, the axle being turned by means of heavy chains wound around a drum which the operator turns through a worm and wheel mechanism. This latter is the accepted steering gear for heavy steam tractors, and those makers of gas tractors whose previous experience has been with steam tractors somewhat materially cling to this practice.

Of the Ackerman type axles practically all carry the load at the middle through a pivot support. To take up the horizontal shock on the axle when one road wheel strikes an obstruction, diagonal radius rods are run from points on the axle close to the steering heads to points on the frame at or close to the fore and aft axes. In a few instances the need for these radius rods is obviated by providing two bearings for the central pivot support a considerable distance apart or by providing a vertical disk at the forward end of the frame against which the axle rests.

In practically all tractors the frame is considerably higher than the front axle, because it lies on top of the rear axle, which is higher than the front axle, as the rear wheels are of greater diameter than the front. To make front axle and frame join up, some makers kink the axle up at the middle, others provide the frame with a downwardly extending bracket, while still others secure a sort of pedestal to the axle to which the frame is pivoted.

*High pivot together with Lemoine pivots to give front end height*

*Axle with inverted Elliott steering knuckles*

*Axle with center kick-up*

*Built-up axle with spring support*

*Short axle and high center bracket raising frame above front wheels*

*Built-up axle with  $\frac{1}{2}$  ell*

*Axle with transverse adjustment for furrows*

*Spring support on steering knuckle*

*Extremely narrow tread front end*

*Arched axle with diagonal radius rods*

*Straight axle with inverted heads*

*Fifth wheel steering design*

*Axle section varies in proportion to bending moment*

From the standpoint of ease in manufacture the straight axle seems to be preferable. It is quite evident that as yet only few drop forged front axles are used on tractors, or, to be more explicit, a comparatively small number of tractor models are equipped with drop forged axles. The drop forged axle is generally regarded as the highest type of axle construction, and that it is not used more extensively is due to the fact that many makes of tractors are not turned out on a sufficiently large scale to warrant the comparatively heavy investment in dies necessary. Those tractors which are produced in the largest numbers generally have drop-forged axles. Others employ cast steel axles and built-up axles of strip steel or partly of strip steel and partly of castings. The built-up axle is certainly not the tractor axle of the future. Its use may be fully warranted, however, at the present time because its manufacture may be within the capacity of the truck manufacturers' own works, and independence of outside shops is quite an advantage in these strenuous times, even though the tractor has a high priority rating.

#### Variety in Steering Heads

As regards type of steering heads and knuckles, all of the three well known designs are in evidence—the Elliott, the inverted Elliott and the Lemoine. The Elliott appears, however, to be in the lead, and it would not be surprising if it won out in tractor work the same as it has in automobile work.

In examining tractor front axle designs one misses that nice distribution of material in accordance with variation of load as may be found in the more developed automobile axle. For instance, if the load is supported at the middle of the axle the vertical bending moment will be greatest at that point and the height of the section can decrease toward the steering heads.

Although the advantage of spring-mounting a tractor is generally recognized, and spring mounting can be most easily effected and is of the greatest benefit at the front end, only two of the illustrations herewith show a forward spring suspension. One tractor has the conventional half elliptic springs under each frame side rail, while the other has coiled springs on the steering knuckle pins, through which the weight of the tractor forward part is transferred to the stub axles. This latter construction looks very simple and attractive, though some difficulty might be anticipated with the lubrication of the pins.

**EXPERIMENTS** recently carried out are said to have shown that the inner tube of pneumatic tires keeps its elasticity for a long time when lying in a solution of 10 per cent glycerine and 1 per cent soda in water.

# The Roland Single Seater Fighter

Mechanical Details of a Fast Machine of Very Light Construction—Fuselage Built of Plywood Covered with Fabric

**A** SOMEWHAT detailed description of the Roland single seater biplane, one of the fast German machines, appeared in a recent issue of *L'Aerophile*. We have redrawn the illustrations accompanying the article and reproduce the following from the description.

The single seater Roland biplane D-II, which first made its appearance at the front in March, 1917, is again frequently met with by French pilots, especially in the eastern sectors. The principal dimensions of this machine are as follows: Span of upper plane, 29.2 ft.; span of lower plane, 27.9 ft.; length, 22.8 ft.; height, 9.7 ft. The weight of the machine, 1820 lb., is slightly greater than that of the Albatross D-III. As it has a lifting surface of 248 sq. ft., the load carried per square foot is about 7.3 lb.

The construction of the fuselage is noteworthy. It is built entirely of plywood, covered with fabric, monocoque fashion, and it has an oval section which ends in a vertical knife-edge at the stern post. The construction is very light, the framework consisting of very thin longerons extending the whole length of the fuselage. Rigidity is secured by means of plywood partitions uniting the middle of the top half with the middle of the bottom half. The total thickness of the six layers of the plywood is only 1/16 in. At the rear of the pilot's seat there are only four thin layers. Between the pilot's seat and the engine there is a superstructure to the fuselage which thins out at the top to a fin 4.4 in. thick, to which are attached the radiator and the upper plane.

The central section of the upper plane is hollowed out to provide space for the radiator. In this way the cabane is eliminated. On the lower part of the fuselage there are two shoulders, one on either side, to which the lower planes are secured. At the rear the tail skid, built of timber and shod with metal, penetrates the fuselage through a kind of swelling, which reminds one of the Nieuport construction. The pilot is seated high up, his vision being assured by two windshields placed one on each side of the central ridge. The field of vision is

very obstructed and visibility is not so good as in other machines.

The planes are trapezoidal in plan, unequal in span, without stagger or dihedral, but swept back  $1\frac{1}{2}$  deg. Their chord is uniformly 57 in., and their gap 53 in. Their ribs are perpendicular to the leading edge, and, as each strut of a pair is attached to a common rib and the wings are swept back, the struts are not exactly one behind the other.

The upper planes are formed on two spruce spars placed 32.6 in. apart, the front one being 5.12 in. from the leading edge. There are 12 ribs, which are placed 14.6 in. apart and are interspaced with laths 0.4 in. wide, running from the leading edge to the rear spar. The distance between the main spars is maintained by four compression members consisting of steel tubes. These are 1 in. in diameter and are placed at equal intervals of 5.4 in.; they are cross-braced by  $\frac{1}{8}$ -in. piano wire. Two fabric strips between the leading edge and the front spar and two others between the front and rear spars alternately pass from one rib to another, over and under it. Some angles in the wing frame are kept rigid by plywood angle pieces.

The ailerons, which are fitted to the upper plane, do not project and are unbalanced. A strip of plywood placed over the fabric protects the aileron hinge at its attachment to the rear spar. Along this line the aileron measures 71.6 in. It is 16.5 in. wide. Its pivot consists of a 1.2-in. tube. The aileron cranks are operated by two vertical tubes, Nieuport fashion.

In the upper left-hand wing there is a gravity feed fuel tank. The upper planes are attached directly to the highest part of the fuselage, with the aid of a special bolt which recalls the system of attachment used on the R.V.G. CIV.

The structure of the lower wings is like that of the upper wings. The spars are disposed in the same way and, consequently, maintain the same distance between one another. There are ten ribs to each wing, of which

nine are 0.4 in. and the last is 1 in. thick. Between any two of them there is also a light lath 0.4 in. thick. The bracing is the same as in the upper wings, except that the struts, made of four steel tubes, are slightly different, the first being of 0.8 in. and the three others of 1 in. diameter. From the first to the second is 46 in., from the second to the third, 44.5 in., and from the third to the fourth, 43.7 in.

The lower wings are secured to the stub planes on each side of the base of the fuselage. The angle of incidence is 4 deg. at the second rib and 3 deg. at the seventh. The inter-plane struts are of 1 in. diameter, placed inside a stream line of wood which gives them a depth of 3.6 in.

The whole tail unit is of a trapezium form, with a large triangular piece of small depth cut out of the base. The fixed tail plane is of wood and the two balanced members forming the elevator are entirely of metallic construction. The leading edge of the fixed tail plane is of wood, hollowed on the inside. A piece of wood, which traverses the fuselage and sticks out 20 in. on each side of it, is embedded in the hollow part of this leading edge and thus insures absolute rigidity. Two struts of stream line tubes running from the top of the fin to the angle of the elevator further add to the rigidity. The rudder is almost rectangular in form, with rounded corners. It is balanced by a triangular part surrounding the pin, of which the leading edge is similarly oblique. The rudder

is tubing and the pin is of 3-ply wood forming part of the fuselage.

The control cables of the elevator are concealed inside the fuselage and those of the rudder only come out of the fuselage about 40 in. from the end.

The single-seater Roland D-II is fitted with a Mercedes engine of 160 hp. of a type already described. Besides the supplementary tank placed in the upper left plane it has a tank measuring 28 x 28 x 10 in. under the rudder bar.

There are two Spandau machine guns operated by the motor. They are placed one on each side of the engine inside the fuselage, from which they only protrude at the front.

The undercarriage is formed by two tubular V's held together by two cross cables. Their point of attachment corresponds to the base of a partition of the fuselage. The axle is placed between two tubes and is enclosed in a streamline casing. The wheel track is 70 in. The wheels are 30 x 3.94 in. and the springing is of rubber cords.

It has been said that the D-II Roland, owing to its light construction, often suffers from a deformation of its fuselage and is very apt to spin. It is, however, certain that this machine, which was quite a new idea at the time of its creation, has been among the best of the German chaser machines.

# Steering Creeper and Two-Wheeled Tractors

An Outline of Various Plans for Steering Tractors by Other Methods Than That Involved in the Ackerman Steering Axle

By A. C. Woodbury

**I**N tractors of the most familiar type there are two rear driving wheels and two front steering wheels, just as in a motor car. It is necessary that the steering wheels carry a portion of the weight of the tractor, as else they cannot serve to guide the machine, especially where rough ground, unequal traction or other unfavorable conditions make it difficult to follow the desired course. This weight on the steering wheels must be a net weight, after deducting from the dead weight the lifting tendency due to the torque reaction at the driving wheels and correcting for the effect of any change of the center of gravity due to grade. Three-wheeled tractors and even some creeper or track-laying tractors also have

ing axle, engine and all, pivoted to a backwardly extending member which is attached to the plow or other implement which is being drawn. The driver sits on the implement seat and the tractor controls are brought back to a position where he can conveniently reach them. Thus the combination of the tractor with a two-wheeled implement forms a four-wheeled unit, of which the front two are both the driving and the steering wheels. Steering is accomplished by a pinion and a large sector, the former connected to the steering hand-wheel, the operation of which pivots the whole front unit almost as the front wheels of a wagon pivot on the "fifth wheel." As the front unit is so heavy, an independent brake is provided on each side to assist in making a turn. The drive is through a differential of a type which is not free and therefore tends to make the tractor follow a straight course.

## Electrical Steering

Since electrical equipment is beginning to make its way among tractor builders, it would not be a long step to introduce electrical control for this type of steering. An irreversible worm and sector might be substituted for the pinion and sector, the worm to be driven by a small electric motor attached to the backwardly extending tongue of the tractor. A controller for such a device is illustrated in diagram in Fig. 1. The sector, made of insulating material, is mounted on the tractor, A being concentric with the pivot of the tongue. The four strips shown are connected to the battery terminals, as indicated by the + and - signs. The two full circles represent brushes which are connected to the terminals of the steering motor and mounted on a swinging arm attached to the tongue at A and connected to the steering hand-wheel or lever. When the tongue is at right angles to the axle, as in straight ahead driving, and the arm is in middle position, the brushes will be in the positions shown by the full circles. If it is desired to turn to the left the arm is moved so the brushes make contact with the right strips as shown by the dotted circles. This starts the steering motor in the direction required to turn the tractor toward the left, and as the tractor turns the sector is carried with it till the relative positions of sector and brushes are as shown by the full circles. When this position is reached the motor is disconnected from the battery and stops. When it is desired to straighten out again it is only necessary to return the arm with its brushes to its middle position and the tractor will follow.

A popular way of steering creeper tractors is by merely applying a brake to the side toward which the tractor is to turn, the tracks being driven through a differential. A creeper tractor generally tends to run in a straight line unless the resistance is considerably greater on one side than on the other, but a differential lock is sometimes added to make the control more posi-

Fig. 1—Controller for electric steering gear

a steering wheel which must similarly bear a portion of the weight of the tractor in order to be effective.

When compared with a four-wheel drive tractor or a creeper tractor whose whole weight is carried on its tracks, any weight carried on the steering wheels is wasted so far as producing traction is concerned. In other words, this loss is a part of the price paid for avoiding the complications of the types in which all of the weight is carried on the drivers. Without discussing the comparative merits of the various types, we may say that large numbers of the creeper type tractors are sure to be built, and if problems connected with the two-wheeled type, such as those of steering, attachment to implements, and transportation when not attached to any implement, are worked out to the complete satisfaction of the users, this type may prove to be the most practical of all for many farmers.

The problem of steering a tractor by its driving wheels has been solved in various ways, all more or less practical but none altogether ideal, and it seems to offer a profitable field for improvement. Following is a description of some of the possible solutions, some of which are in commercial use, while others are only possibilities.

The method used for steering one of the most popular two-wheeled tractors is to have the tractor unit, includ-

tive. This is probably the simplest steering control that can be found for the creeper type tractors, and on that account it may be the ultimate, but it certainly is not ideal for delicacy. The brakes are controlled by turning the steering hand-wheel to one side or the other enough to obtain the required amount of friction, and the amount required for a certain turn depends upon the nature of the ground and other conditions. A driver who is experienced with this sort of steering can control the tractor well, but to a novice at least it seems to leave something to be desired when compared with the direct and positive steering of a motor car. Of course, there is also some loss of power resulting from the application of the brake, but this is quite negligible under ordinary conditions.

It seems to the writer that a real improvement can be made on this type of steering by developing other means than brakes for controlling the differential. One device

Fig. 2—Steering through the differential

for this purpose has been described in the trade press and is perhaps covered by patents but has not been commercially applied to creeper type tractors. It is diagrammatically shown in Fig. 2.

The differential and drive gear through which power is transmitted to the axle, bull pinion shaft or sprocket shaft (for brevity we will call this the axle) are represented by A. Beside the differential are two gears, B and C, one of which is attached to the axle shaft and the other either to the differential case or the other axle shaft. These two gears mesh with gears D and E on a parallel shaft. Gear D is mounted on a second differential, while gear E is attached to one of the shafts projecting from the second differential. The gear ratios are such that when gears B and C are rotating at the same speed, as they do when the tractor is following a straight course, gear E turns twice as fast as gear D. Under these conditions the other shaft projecting from the second differential, with the worm gear F mounted upon it, remains stationary. This is due to the properties of a differential which cause one wheel of a car to rotate at twice the speed of the drive gear when the other rear wheel is held stationary. This worm gear F therefore gives us absolute control of the action of the main differential and through it of the direction of the tractor. So long as it is held stationary the two drive wheels or tracks can turn only at the same speed and the tractor can go only in a straight line either ahead or backward, while turning the worm wheel in either direction causes one wheel or track to advance ahead of the other, thus changing the direction of the tractor. The worm wheel may be turned by a worm either connected directly to a steering hand-wheel or to a shaft that can be power driven in either direction at will.

Another method of controlling the differential would require a shaft parallel to the axle as in the last described device. This shaft would be solid and would be connected

to the axle at one side of the differential by a chain and at the other side by a belt with variable pulleys, or by some other variable speed drive. The sprocket ratio should be the mean of the variable drive ratios, and the greater the variation possible in the drive the greater would be the available turning angle. The turning angle could be increased by connecting one of the drives to the differential case instead of to the axle shaft, or by replacing the chain connection with a duplicate variable speed drive, the controls of the two being interconnected.

A simpler arrangement is available if the drive is such as to make it possible. This would consist merely of a variable drive to one side of the differential from the same shaft from which the main drive is taken. It might be a belt on variable pulleys beside a chain drive, a friction disk and chain beside a worm or bevel gear drive, or some form of hydraulic drive. Of course, no drive for controlling the differential as suggested would need anything like the capacity that would be required if the whole or even half of the power of the engine were to be transmitted through it. Therefore variable speed devices that would be out of the question for driving the tractor might be quite practical for controlling its direction.

One of the simplest ways of controlling the direction of a creeper type tractor is to omit the differential and provide instead a clutch between each track and some common point in the drive. Releasing one clutch transfers all the driving effort to one of the tracks, which then naturally runs ahead of the other and causes a turn. The nature of the ground and the amount of draw-bar pull being exerted effect the sharpness of the turn and we believe brakes are provided as a further means of regulation.

#### Application of Hydraulic Drive

An ideal drive which would include steering and gear changing as well could certainly be obtained by hydraulic means if hydraulic drives were all their most enthusiastic friends would have us believe. Two variable displacement pumps and two hydraulic motors would be required, together with a method of control which would make it convenient to vary the displacements of the two pumps either simultaneously or independently. The last would not be difficult, but the whole thing has a rather expensive sound and there is some question whether durability and freedom from leakage could be secured in the gritty, dusty conditions in which agricultural tractors work.

A variation of this drive would be to provide a change gear and a gear drive to one track or wheel and a variable hydraulic drive between the change gear and the other track or wheel. This would probably reduce the cost at a sacrifice of some of the ideal qualities of the purely hydraulic drive.

Of course, other variable speed drives are also available, including friction and variable belt drives. Friction drives have already been used to some extent for propulsion of small tractors at least. It remains for those who are commercially interested in these various drives to show how they can be advantageously applied to this steering problem.

To the writer it seems that some one of the methods outlined for controlling the differential other than by brakes, or some simpler means of accomplishing the same result as effectively, would prove a very desirable method of steering either a creeper type of tractor or one carrying practically all its weight on two drive wheels. It should be easier to control than the steering now generally provided, and might prove a convenience in getting the latter type from one implement to another.

# Official Guide for Airplane Inventors

## Possibilities for Inventions and Improvement in Aircraft Design as Stated by Naval Consulting Board and War Committee of Technical Societies—New Ideas Solicited

**S**UGGESTIONS for the improvement of existing aeronautical devices and new aeronautical inventions are solicited by the Army and Navy in a bulletin issued with the approval of Josephus Daniels, Secretary of the Navy. The bulletin compiled by the Naval Consulting Board and the War Committee of Technical Societies tells in detail the possibilities of airplane motor power improvement, problems in aeronautics, aircraft problems and contains a working bibliography for airplane design and aero motors.

Many great improvements, it is pointed out, have been made by men with little practical experience or technical training, and every citizen with a "free brain, clear insight and fresh enthusiasm" is invited to submit inventions and ideas to Thomas Robins, Secretary, Naval Consulting Board, 15 Park Row, New York City.

At present, adds the introduction, the Government is concentrating all energy on speedy production of the best design secured from present engine development. Consequently the Government is not just now in a position to consider improved engines and systems of power and will defer this until after the pressing needs of the moment have been met. Minor improvements applicable to the present engine will be considered at any time, however.

Possibilities for radical advances in motive power are shown by the following outline. Cost of power, it is stated, is immaterial for war uses. The important objects are:

To secure steady, reliable operation.

To obtain lighter weights than the 2 to 2.5 lb. per horsepower now attained. (1.75 lb. without radiator, water, piping, propeller, etc.)

To obtain more work per pound of fuel carried.

The average airplane engine operates under the following approximate conditions, showing the possible improvements for all new power cycles and gas turbines:

Energy of fuel delivered by engine shaft to propeller (thermal efficiency). For the indicated horsepower .....	30 per cent
For the brake horsepower .....	25 per cent
Energy consumed by engine friction .....	5 per cent
Energy lost by cooling .....	30 per cent
Energy escaping in exhaust (including that of unburned fuel .....	40 per cent

Total fuel contents .....	100 per cent
Mechanical efficiency of propeller .....	75 per cent
Net energy of fuel delivered by propeller and available for flight ( $0.75 \times 0.25$ ) .....	19 per cent

Conservative airplane engine improvements discussed by E. H. Sherbondy, U. S. Airplane Engineering Department of the Bureau of Aircraft Production, deal with carburetion, precompression of air supply for engine, ignition, engine parts, self-starters, exhaust mufflers, cooling radiators, fuel system, fuel, propellers, machine gun synchronizers and instruments. Suggestion is made by Mr. Sherbondy that those interested in these problems should read back issues of the American, English and French periodicals devoted to aeronautics and automobile engineering, and the works listed in the bibliography attached.

The chief problems refer to improvements in motor power apparatus, its specific weight, and its thermal efficiency referred to brake horsepower and the reliability of its mechanical construction. Many helpful suggestions, it is stated, may be obtained from studies of experiments which have failed for reasons that may not now be operative because of the existence of better materials and increased experience. This point is illustrated in the history of automobile rear axle drives.

For many years straight bevel gears were used. The helical bevel gear, known many years, did not come into practical use until 1912 because economical production had not been devised.

The present state of aircraft engine design is summarized as follows:

Engine types are practically standardized and include two principal types, one having 6 or 8 vertical cylinders all in line, the other being the "V" type with 8 or 12 cylinders. Aluminum has greatly increased the possibilities of radial types of engines in moderate powers, these being designed with either fixed or rotating cylinders and either air or water cooling. To be useful for aircraft work an engine must not weigh more than 2.4 lb. per brake horsepower (1.7 lb. without radiator, water, piping, propeller, etc.). It must be composed of parts that can be readily produced by American manufacturers. The thermal efficiency of current types of aircraft engines referred to brake horsepower ranges from 25

### The Government Asks for Ideas for the Improvement of:

Spark Plugs

per cent to 32 per cent, this being the proportion of the original heat content of the fuel consumed which appears in shaft horsepower. While the efficiency of these engines is higher than any other type of prime mover, including commercial Diesel engines within the output range of aircraft engines, their economy is rather low at less than maximum horsepower, and every effort should be made to improve economy at part load. The economy varies but little for considerable changes in altitude, so that in this matter the effective altitude is not often of importance.

Improvements suggested for the present system of motive power should be of a nature allowing development to a practical stage within about 6 months; that is, the apparatus should be experimentally proved and ready for production at the end of this period.

Improvement of carburetor regulation for varying altitudes is sought. In a given engine operating successfully at two different altitudes under identical conditions, i.e., at the same speed and with the same carburetor adjustment (the same sectional areas for the passage of air, gasoline and mixture) the amounts of air (by weight) drawn into the engine in the same time are proportional to the barometric pressures at the two altitudes. The volume of air drawn in remains the same. The density of the gasoline does not vary with the altitude and the effect of changes in altitude upon the mixture quality is a resulting increased richness of carburetor mixture in higher altitudes, which varies inversely as the square root of the ratio of barometric pressures (assuming the engine speed and throttle position to remain constant). While this is approximately correct for ordinary elevations it is decidedly true at altitudes over 15,000 ft.

This causes the need for carburetor regulation for varying altitudes. This regulation is now effected by a device called an altimeter, which controls the gasoline flow through the carburetor nozzles. This may be accomplished either by re-

(Continued on page 286)

## Plans and Accomplishments of the Italian Air Service

**Italy Is To-Day Supplying All Its Own Needs in Motors and Planes—  
Must Have American Raw Materials—Types of  
Machines That Have Been Developed**

**I**F the Allies can increase their air forces by 10,000 more planes than the Germans can gather within the next eight months the war will be quickly won. This is the opinion of Captain Giuseppe Bevione, Chief of the Italian Military Mission of Aeronautics in this country. Italy, said Captain Bevione, is now producing 1500 airplane engines per month, and will produce more than 2000 engines per month before the end of this year. The most important engines used for fighting airplanes are the A-1, sometimes called the Balilla, developed from the S. V. A., and the Pe Gamma, which is an adaptation from the original planes of the Pomilio. Numerous first class scouting and day bombing machines have been built. Foremost among the Italian factories is the Fiat, building the A-12 engine, developing 300 hp., and the

*Side view of the S.I.A.-9B. This machine is used for day bombing*

*The S.I.A.-9B, equipped with the largest engine in the world, the Fiat 700 hp. Note the gasoline tanks on the under side of the upper planes*

-14, developing 700 hp., the latter being the latest powerful engine now used at the front.

Following is a statement by Captain Bevione on the aviation work of the Italian Air Service, together with the raw-material needs of Italy, for which she looks to this country:

"Everybody knows that the war industries of all the Allied nations, and particularly the industries of aviation, draw from America the essential part of the raw materials they use.

The magnificent victories of the allied armies in the last few days, which have added so much glory to the American name, make us wonder at the splendid results that might be obtained were we able to realize what we most need now, a supremacy of the air, to pursue the retreating foe with our squadron of bombers, spreading terror and disorder among his lines and destroying and closing railway junctions, roads, and bridges and trestles.

#### Can Produce Air Fleet Ten Times That of Enemy

"As far as raw materials, industrial organization and man power are concerned, the Allies can produce and equip an aerial fleet at least ten times larger than that of the Central Powers. If this result can be obtained in 1919, if within eight months the Allies, with this country, can count on having in Europe 10,000 aeroplanes more than the enemy and will make them serve their purpose skillfully and inexorably, the war will be won. The foe's power of resistance would be struck at its very vital source, at its center of supplies, at the great factories of arms and ammunition, and bridges, railways and roads through which the armies at the front are kept in fighting trim.

"But in order to carry out this simple plan in its entirety (as nothing decisive could be attained unless it was developed fully), all of us, governments and peoples, must be aware of the absolute and obvious fact that the army is of the greatest import, and that aviation

Two views of the Caproni biplane which is equipped with three 300-hp. Fiat engines and is considered the best bombing machine. It is used for day and night service on all of the allied fronts. America has adopted it and is building it equipped with the Liberty engine. This plane is known as model C.A. 5

can give us a formidable contribution toward the refusal of any peace compromise that Germany and Austria

A group of Caproni triplanes equipped with three Fiat engines each of 300 hp. They are used for night bombing

*A view from the rear of a S. V. A. pursuit plane, showing the cockpit of this unique Italian product*

may try to impose on us. Aviation is a sure means of victory, and to it we must devote without hesitation and without reserve all of our efforts and best resources.

"I am betraying no secret in assuming that the closest

*The Ansaldo, a special adaptation from the S. V. A., a very speedy Italian plane with exceptional maneuverability. It is equipped with a Spa engine of 240 hp. and attains a speed of 147 m.p.h. It is a single-seater*

agreement has been reached on this fundamental point between the American authorities in charge of the industrial and technical development of aviation and Italian Commissioner for Aeronautics. The latter has been such a vigorous incentive to our aviation industry that he has brought it within a few months to its magnificent development, well deserving of far-reaching results. But in order to have an unlimited output of powers of production, Italy is obliged to seek from our country an adequate and continually increasing quantity of raw materials, metals, wood and textile matter. It is an absolute necessity that we obtain such assistance from the American government, in perfect harmony of course, with the need of our allies, and for this purpose I was sent to Washington and appointed chief of Italian military mission for aeronautics.

"I will endeavor to develop my program in the most logical and persuasive manner, proving to the Federal authorities that Italian aviation is well worthy of the assistance it is demanding of the generous and powerful American nation.

*The Pomilio, one of Italy's reconnaissance machines which is equipped with a Fiat 300-hp. engine*

*The S.I.A.-7B, equipped with a Fiat 300-hp. engine. This is another of the reconnaissance machines being used by the Italian armies*

"I will show how efficiently raw materials that have been provided us are being utilized, and I shall keep the men in charge of American aviation in close contact with every progress and acquainted with the great expectations that are in store for our Italian aircraft production.

"This progress is indeed remarkable, and every Italian can justly be proud of it. Italy to-day has overreached the critical period of experimental research and of uncertainties, always to be overcome at the beginning of new enterprises.

"To-day Italy is supplying its own needs in motors and planes entirely, besides using its own original types of planes; and within a few months all the planes flying at the Italian front will be of Italian manufacture and design and equipped with Italian motors.

"It is generally known that military aviation needs four types of planes—fighting, scouting, day bombing and night bombing. As to fighting aeroplanes, we now turn out two splendid types—the A-1 (so-called "Basililla"), developed from the S. V. A. of the Ansaldo factory, and the "Pe-Gamma," from the original plans of the Pomilio works (recently taken over by the Ansaldo factory).

"As to the other types of planes for warfare, Italy is well provided with models of her own, which are pro-

duced in large quantities. We have, in fact, two types of scouting craft of high value—the S. I. A.-8B (developed from the former 7B type), made by the S. I. A. factory, which is a branch of the Fiat, and the P. F. of the Pomilio factory, which, as previously stated, has been incorporated into the Ansaldo works.

"Two important raids were performed last year by the S. I. A.-7B aeroplane; that is, the flight from Turin to Naples and return, 1,004 miles, without landing, and the Turin-London flight, 700 miles, with the crossing of the Alps.

"For day bombing, where speed and great power are essential, two Italian planes are ready to-day that already have undergone the most severe tests. One is the S. V. A. built by the Ansaldo factory, which can be used also for fighting and scouting, and already has accomplished the bombing of Innsbruck, besides performing the raid on Friedrichshafen. The second plane is the S. I. A.-9B, equipped with a Fiat engine of 700 hp. This, owing to its speed and great power, can be flown over long distances and can be used in broad daylight bombing.

"For night bombing there are the biplane and triplane Caproni, now of international fame. The larger model of Caproni biplane, CA-5, equipped in Italy with three Fiat motors of 300 hp. each, is without doubt superior to all similar types in existence, so much so that all of our allies—American, British and French—have adopted it, and at the French front several Italian squadrons of Caproni are in active service, adding new records to their well-established reputation. It is known to-day also that at Mineola, Long Island, the first Caproni built in the United States, equipped with Liberty engines, has gone through its tests with the greatest success and that the Federal authorities have placed with American firms large orders for Caproni-Liberty aeroplanes.

"I firmly believe that Italy can be proud of its aviation achievements and victories, as on the sixteenth of last June, the first day of the ill-fated Austrian drive on the Piave, 34 Austrian airplanes were downed, and only two of our planes were reported missing.

"But no aeroplane, perfect as may

*Plane Engines—The new Isotta Fraschini, known as type V-6. This engine has 300 hp.*

*Italian Airplane Engines—The Fiat 300-hp. engine; six-cylinders*

be its design and construction, could be of any service if not equipped with the best and most reliable motor. The capacity for production of the factories connected with the manufacture of aircraft must be equal to cope with the demands for the keeping up of the full efficiency of the aerial force. And here, again, Italy's efforts have met with success.

"The Fiat factory stands first as one of our largest manufacturers of aviation motors, with her two well-known engines, the A-12 and the A-14. The A-12 develops 300 hp., and the A-14 700 hp., this being the most powerful motor used at the front for aviation by any of the Allies. The Fiat has a remarkably large output of these engines, and I regret that for obvious reasons I cannot give the exact figures concerning it. But I can say that our aeronautical department which buys all this production, after having met with all of our own requirements, can afford to supply

*Italian Airplane Engines—The Fiat 700-hp. engine, twelve-cylinders, the most powerful airplane engine in the world*

*Italian Airplane Engines—The Spa engine; 240 hp.*

the Allies with an important number of these motors daily, in compliance with their urgent demands. Besides this, the Fiat now has ready a new model, which will be produced soon in large quantities. This is the A-15, of 450 hp., greatly reduced in size from previous models, light, accessible and possessing new and important characteristics that undoubtedly will cause a further and greater development of our military aviation.

"In addition to the Fiat, we have the Spa, of the well-known automobile factory of that name, which, with some important changes and only a slight increase in weight, has been able to develop its old 220 hp. motor into a new 300 hp. motor, without being obliged to change its equipment and machinery, thus achieving a great technical and industrial success and producing a new engine of slight weight and great power. These motors already are being turned

out in large numbers, and will be of the greatest value to aviation, especially fitted to fighting planes.

"Another important factory, the Isotta-Fraschini, produces high-grade planes that have won reputation for their reliability and perfect workmanship. Here again a new motor is ready, the I-F V-6, developing 300 hp., greatly appreciated by both airplane manufacturers and pilots.

"The following figures may give a more correct idea of Italy's effort in the production of aviation motors: 1500 motors a month is the present output; before the end of the year we certainly shall produce more than 2000 motors monthly, which means the astonishing figure of 24,000 aviation engines a year, all of Italian design, of Italian construction, all of high repute, established after the severest tests. Yet at the beginning of the war Italy possessed not more than 100 aeroplanes and less than 100 pilots."

# Training 150 Operators Per Week

How the Vestibule School of the Remington Arms Co. Is Meeting the Demand for Skilled Workers of Both Sexes—How Operatives Are Routed Through the Plant

UP to the first of July 565 student employees had been instructed in the training department or vestibule school of the Remington Arms Union Metallic Cartridge Company at Bridgeport, Conn. Of these student employees 390 were male, and 175 were female operatives. The school is now training approximately 150 students a week, starting 50 each Monday, another lot of 50 each Wednesday and as many more each Friday. It requires two days on the average to train these students. Some of the very simple operations can, however, be taught in a day, while in the case of certain others it takes several days to give the operatives a sufficiently high degree of skill.

There are fourteen regular instructors in the school, but as the work is to be materially extended and new machines are to be installed, it is estimated that twice as many will be required within a short time.

The company has a reserve list of instructors who are either expert operators or adjusters. These men are posted at various points throughout the shop and are ordinarily to be found at their regular occupations, but when it happens that there is an overflow in the school, the extra students are sent to these instructors for training.

The instructors themselves are carefully trained so that they may be thoroughly competent to teach, and they are selected for this work because of a natural aptitude for imparting knowledge.

Except in a few special cases, male student employees receive 35 cents per hour flat rate for 8 hours' work. This means that they get \$3.85 for a 10-hour day, as they are paid at over-time rates for time work over 8 hours.

The work of the school is supervised by the Educational Director, who looks after all educational work in the plant. Besides the vestibule school, the company also conducts a toolmaker apprentice 4-year course and a machinist apprentice 3-year course. Apprentice courses are conducted according to the well known corporation school plan.

## The School Lay-Out

The department set aside for this school covers a floor space 62 feet wide by 128 feet long, and is layed out as shown on the accompanying sketch.

Machines are set up on both sides as one enters. There is sufficient room around each machine to allow a group of about 6 students to stand without interference. This is necessary because each instructor usually has 5 or 6 students under instruction.

In the center of the room is an inspection crib where the finished work is brought and inspected by students. At the left is the office where the Supervisor and his clerks are stationed. At present, 2 clerks are required besides a timekeeper.

In the far corner is a lecture room, separated from the machine department by a double partition to eliminate as much noise as possible. The lecture room is

fitted with a platform and lecture room chairs of most approved type. Here the students are introduced before starting to work, the policy of the company is explained to them and a general talk on safety, health and responsibility is given them. They are then divided into

## How the Remington Company Introduces Itself to New Employees

**Y**OU have offered to sell your services to the Remington Armory, at Bridgeport.

The policy of this Company is one of great value to you, it is one in which **FAIR DEAL** plays an important part. Reduced to its simplest form it amounts to this, "The Company is anxious to help those who will help themselves," and in return expects good **SERVICE** and **LOYALTY**.

We want to educate you to do your work in the best manner possible so that it will be easier for you, give you better financial returns, and moreover, it will cease to be drudgery and eventually its faithful performance will become an inspiration to accomplish bigger and better things.

So frame your mind that you will look upon your employer as your friend, be determined to use your head at least as well as your hands, to always use your head first, and then do your work after you know the **WHY** of everything about it that concerns you.

Instruction sheets will be given you to study carefully. If any of this information is already familiar to you, it will only be necessary for you to read it over carefully. Information that you are not acquainted with, must be studied carefully, so that you may eventually be able to answer questions on any topic contained in these instruction sheets.

Your rating will be greatly influenced by your ability to answer questions relating to your work and these instructions.

If, after working at any job, you find that it is not to your liking or that you are not capable to do the work, do not lay down on it, but make the best of it you can, and speak to your superior about your case. If you "throw up hands" you not only make yourself unfit for your present job, but you lessen your chances of being given another job on the ground of incompetency.

Before transferring to another job, it will be necessary for you to qualify for the new work that you expect to take up.

To many workers, the other fellow's job looks better to them than their own. Do not allow this feeling to make a slave of you, as you cannot be highly efficient while under this influence. Stick to your job and master it well, then the bigger job will find you.

A hard day's work is not necessarily a good day's work. Knowing how to do the work well, will convert a hard day's work of ordinary success into an easier day's work of better success, because you will become **EFFICIENT** by reducing lost time and lost motions all you can.

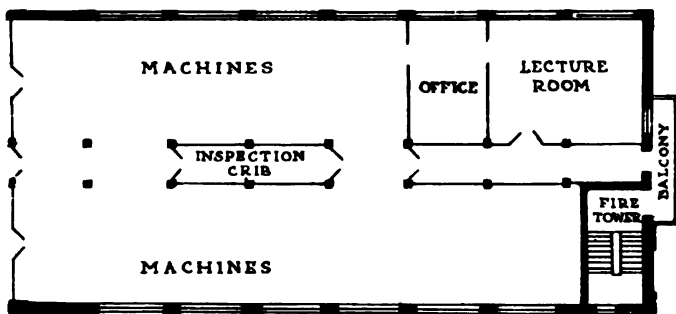

structor's satisfaction and can operate the machine properly, he is competent to be sent to the production department.

Men learning to become adjusters must first go through practically the same course as operators, especially if they are not acquainted with the operation of the machine which they are to adjust. But they must become much more competent to operate and then they are taught how to make adjustments of the machine parts and groups, also those of the tools and fixtures.

They must become able to make any adjustment required to change the dimensions of the component when these do not match the gages. They must also be able to answer the instructor's questions satisfactorily before being released. Records of their performance, both in and out of the school, are kept in the same manner as those of the operators.

When machine operators are needed, the foreman or supervisor must issue help requisitions for them on the school. These requisitions must not be made for more than two operators. Therefore, if ten operators are required, five separate tickets must be made out.

If men are already trained, the requisitions will be

Plan view of the Remington training school, showing the inspection crib, office and lecture room

immediately filled, either in part or entirely. When there are not a sufficient number of operators already in the school, the unfilled part of the total requisition will be sent to the Employment Office for material to be trained. As soon as these men are trained, they are supplied to the department which asked for them.

The machines that are in the school represent only such kinds as are used in large numbers in the shop, and can be isolated for instruction purposes.

The operations for which the school is now fitted are:

Milling—Hand	Shaving
Milling—Power	Tapping
Milling—Thread	
Profiling	Press—Foot
Polishing	Press—Power
Barrel Drilling	Hand Screw Machine
Barrel Turning	Bench Work
Barrel Chambering	Inspection
Barrel Grinding	Adjusting
Drilling	

The instructors keep a daily record of the students' performance, on a  $\frac{5}{8}$ -in. card form for that purpose. When the student is transferred to the shop, a permanent record is made on an 8½ in. x 11 in. card for that purpose. After twelve weeks, a report is made by the foreman of the employee's performance, which is also incorporated on the permanent record sheet, this being kept in a file for reference. This record also has other information which may be useful in placing the employee properly and determining the ultimate result of training operators.

The routing of employees between departments and to and from the school is handled in the following manner:

1.—Ordinarily, transfers are effected in accordance with instructions, using the form "Transfer Recom-

DAILY REPORT					
NAME _____				NO. _____	
DATE	ADAPTABILITY	SPEED	QUALITY	CONDUCT	ATTENDANCE

Form used by instructors to keep record of students' performance while in school

mendations," provided for the purpose. This is made out in the department from which the operator is going, is signed by the section supervisor or superintendent, and is forwarded to the employment office with the transferring operator.

2.—This operator is then assigned to any department whose "Requisition for Help" may be on hand at the employment office. If possible, the operator should be put at work similar to that which he had been doing, to avoid the necessity of training again.

3.—The transfer from one department to another of an operator requiring training in the school.

If the operator cannot be put at work for which he is trained, he will be sent to the school for training. He will be on the payroll of the department to which he is transferred and not on that of the school.

4.—Transfer of an operator from the school to a shop department.

An operator who is on the school payroll must be transferred from the school to another department in the regular way, as described in paragraphs 1 and 2.

5.—The assignment by the employment office of an

Very good 90 to 95% Passable 70 to 80%  
Good 85 to 90% Cannot pass Below 70%

If for any reason, you place this employee at different work other than that for which he was trained, please give reason and all particulars here:

Foreman's Signature \_\_\_\_\_

EO Form-405

The foreman's report made out for each trained employee after 12 weeks in the production department.

operator who has been requisitioned by a shop department to the school.

This can be effected as described in paragraph 3. As soon as the operator is trained for the work he is to do, or has proven that he can already do his work properly, he is then released to his department of assignment without formality.

6.—*The assignment by the employment office of an operator to the school who had not been requisitioned by a shop department.*

If the Employment Office wishes to hire a person who shows decided aptitudes to become an operator, yet has no place to send this person at the time, that person may be assigned to the school for instruction. In this case the employee is hired for the school outright and is on that payroll until transferred to a shop department.

7.—*Training of an operator already working in a department who will return to the same department after training.*

An operator requiring instructions may be sent to school for additional or different training, and then again to his department without formality, except by phone or ordinary written notice from the foreman to the instructors in the school. This operator remains on the shop department payroll.

8.—*Emergencies.*

In an emergency, one or more operators (partly trained or otherwise) may be hired or transferred from department to another, or from the school to shop departments without formality, but this should be only when it possibly cannot be avoided, and the necessary regular routine forms should be made out.

## An Improved Chain Track for Tractors

Employing a Guided Rocking Joint with Dust Excluder and Inclosed Track Carrier—A Chain of Sheet Steel Sections

**A**N improved design of chain track for tractors has been developed by Ralph Wishon of 730 Eddy Street, San Francisco, Cal. Knowing the effect of dust and grit on the usual link and pin type of chain, Mr. Wishon set out to do away with pins. He achieved this object by the use of a properly guided rocking joint with dust excluder and of an inclosed track carrier. The chain is composed of sheet steel sections each built up of three pieces interlocking with each other and securely riveted together as the chain is assembled, bolts being used at the master links. The tread piece is made with an overlap to exclude dust. The shroud piece prevents lateral movement and bending movement, except from a straight line inward; it acts as a guide for the rocking joint and a smooth contact and guide for the rollers.

The hook piece has a small hook at one end for engaging the next or following section and a larger U-shaped hook at the other or forward end which also acts as a tooth for engaging the driving sprocket. The track is mounted on two rows of pressed steel rollers running on a raceway of sheet steel secured to two angle iron frames, except at the forward end, which is free to act as a chain tightener and spring, supported after passing through the angle iron frames as shown. This plate is also slotted to pass the driving sprocket. The raceway plate is held in place by two outside plates just clearing the tread all round and secured by through bolts as shown.

An arc-shaped casting is let into these plates and when the track carrier is mounted on the frame it is slipped over the end of a heavy rectangular bar which is bolted across the frame, and springs are inserted under the bar to take the weight of the main frame and permit the track carrier to oscillate on the trunnions. The track carrier is further guided in its vertical movement between two hard wood blocks as shown. The rear end of the track carrier has a trunnion ring riveted concentrically with the driving sprocket and fitting inside another ring which is riveted to the main frame. A heavy through shaft is threaded at each end for a nut and passes through both track carriers, the main frame holding the carriers securely in place, although allowing an oscillating movement. This shaft also acts as a bearing for two bronze sleeves, each of which carries a driving sprocket and a main drive gear, both being fitted to the sleeves by six loose fitting keys acting as splines. The sleeves are held in place by a spacer in the middle and by washers in each outside end.

The whole assembly may be dismantled by removing a nut from one end of the "through" shaft and withdrawing the same from the other side. The track, as shown, can be modified by change of pitch, width and supporting contact, as in

the case of the truck wheel type of track carrier, the wheels of which may travel on the upturned edge of the shroud piece, which may overlap if necessary.

Vertical section through chain track

Showing self-adjusting track for chain rollers

# Diffusion of Manufacturing Will Solve Many Industrial Problems

Breaking Up Centralization and Congestion in Urban Communities Will Benefit Labor Conditions—More Work for the Motor Truck

**A** MOST alluring picture of the benefits to be derived from a diffusion of manufacturing from the cities where it has become centralized to the rural sections of the country is drawn in a statement just issued by C. C. McChord of the Interstate Commerce Commission, who has been named by President Wilson as one of the umpires of the National War Labor Board. The benefits which the commissioner foresees as coming from such a readjustment are not only industrial but also national through a raised standard of citizenship.

Mr. McChord offers his suggestion as a plan calculated to go far in solving the many problems of labor, the distribution of materials and the cost of living after the war. And in the accomplishment of the plan, although Mr. McChord does not emphasize the fact as strongly as he might, the motor truck will play a most important part. Scatter our manufacturing evenly over the country and throughout the rural regions to the greatest practical extent and the need for motor trucks will be greater than ever before. We give an abstract of the commissioner's statement in the following paragraphs.

## A Radical Change Needed

What is needed in this country is a wider diffusion of manufacturing industries and the local supply of the necessities of life. Products of our factories are distributed throughout the land, but under circumstances of such economic waste as to demand a radical change. In the development of manufacturing many elements have conspired to confine factories to limited territories or particular cities. Among the chief of these was the fact that the railroads favored certain manufacturing centers in the way of facilities and rates.

While the payment of rebates that found their way into carriers' accounts ceased on the passage of the amendment to the Act to Regulate Commerce of 1906, and many carriers had ceased to make such payments previously, the matter of preferential rates and the furnishing of superior facilities to competitive centers continued with unabated vigor until the taking over of the railroads by the President on Dec. 28, 1917. That event was intended to bring about a complete change. Railroad managers were at first reluctant, and in fact some have not yet fully accepted the fact that each road is no longer a competitor of the other, but all are engaged under Federal control as a great unified system in the business of transporting the necessities of war and the commerce of the country. The change was as startling as sudden. Preconceived notions of the rights of each carrier as against the other, and their relation to the public, were changed over night.

It seems to be conceded by every one that, no matter what is done with respect to the great transportation systems of the country after the war is over, certain condemned practices and the unbridled competition of past years are at an end, and that by some means the carriers of the future will be under such regulations as will insure the largest and most effective use of the facilities they have for the conduct of the transportation business of the land without favor to one shipper or prejudice to another.

## Railroads Must Help

The most important matter just now, however, is the part that the railroads should play in the readjustment that must be made in our industrial and economic conditions. As be-

fore noted, it has come about that the large part of our manufacturing is done in our cities. The greatest manufacturing cities of the nation, considering the variety and quantity of production, are Chicago, Ill., and Philadelphia, Pa. Southern New England has developed into a succession of manufacturing cities. Pittsburgh dominates the iron and steel industry and controls prices wherever sales may be made in this country, as Chicago dominates and controls the prices of meats and their products. New York City produces immense quantities of ready-made clothing, employing thousands in sweatshops of unsavory surroundings. The result is that workmen and women in largest numbers live under conditions that are not sanitary, wholesome nor conducive to good morals. This has happened in a country that is less densely populated than any of the great nations of earth, and where there is room enough for every citizen and resident to enjoy his full share of pure air and sunlight, and to live under conditions conducive to health, morality and happiness. It would also enable him to secure a home at moderate cost, or at reasonable rental, with an area of ground sufficient to permit him to cultivate a garden where fresh vegetables may be grown for his own use.

There are many other considerations that dictate a re-location of our manufacturing industries. In the first place it costs more to do business in a city than in the country. Land values and costs of construction of plants, taxes, etc., constitute charges that must be met from earnings. It costs more to live in a city than in the country. A lower wage payment in the country than in the city would enable the workman to secure more comforts of life, to clothe his family better, and educate them more adequately. If the factory is located near the raw product there is saving in transportation costs which will be reflected in net earnings.

## Recent Developments

In very recent years there has been here and there a man whose vision has been broad enough to see what it is the consuming public demands, and has attempted to meet it. One concern has in recent years by co-operation with residents induced the building by local capital of hundreds of flour mills at country points in the Middle West and South, which supply consumers in the region round about each mill with flour, meal and feed. Another man owns in his own right many branch houses for distribution of groceries, merchandise and general household necessities. He ships to the branch houses in carload lots and distributes to his customers in motor trucks. He is doing a large and thriving business. Both of these institutions are representative of a class that has recently come into existence.

Does not the public demand which these institutions seek to meet point the way to a solution, in part, of the reconstruction problem that now confronts us? If wage scales are to be readjusted downward to meet conditions in times of peace, the wider diffusion of factories presents an alluring way out. What the workman desires, and what he has the right to demand, is opportunity to live in comfort. Reduction in the rate of his daily wage means, as he now sees it, lessened opportunity to secure to himself and his family those necessities which go to make comfort in daily life. In most any country town of 1500 or more population that might be named in the Middle West or the South there is opportunity to live better and enjoy more of the real comforts of life, at materially lower wages, than even an approach to the same state of livelihood can be secured in any congested manufacturing center.

# Buda Model "HTU" Engine

Designed for Truck and Tractor Service—Has Detachable Cylinder Head and Force Feed Lubrication—Special Crank Base Construction and Heavier Flywheel for Tractor Use—Vaporizing Manifold for Burning Kerosene

*The Buda model "HTU" is designed to operate on low-grade gasoline and kerosene*

**A**N engine specially designed for heavy duty service has just been brought out by the Buda Company of Harvey, Ill. It embodies some of the features evolved by the Buda Company for its automobile engines, but is designed to take care of the severe working conditions in tractor service. The Buda Company has been supplying engines to tractor manufacturers for several years, and has made a thorough study of the requirements in this exacting service. The situation in the fuel market has been taken into account, and the engine has been designed to operate successfully on the present low-grade gasoline, but where desired it can be furnished with a specially constructed manifold for operation on kerosene.

The new model HTU is a four-cylinder block-cast engine of 4½ in. bore and 5½ in. stroke. No power rating is given, but it may be stated that this size of engine (312 cubic inches piston displacement) is about that usually employed on three plow tractors.

The cylinders are cast in a block, with detachable heads, and are finished by grinding. Voluminous water jackets surround the entire combustion chambers, and the water space is baffled so as to compel the water to flow over every part of the flame-swept surfaces and cause it to be discharged directly beneath the valves. In the cylinder head provision is made for a large number (21) of closely spaced studs, to insure uniform pressure on the copper asbestos gasket and thus prevent leakage. Particularly large water spaces are provided on top of the cylinders. The spark plugs are screwed into the cylinder heads, and their bosses are completely surrounded by water. S. A. E. standard ⅞-in. plugs are used. The water outlets on the cylinder head are fitted with removable outlet-elbows, which can be located at four different angles.

The cylinder base flange is extended to carry the valve lifter guides, which construction permits of completely enclosing the guides, valve lifters and push rods, and of making provision for oiling these parts by means of communication with the crankcase. The exhaust and inlet pipes are located

on the same side of the cylinder block, which facilitates the making of hot air connections for burning low-grade fuel.

The crankcase consists of two gray iron castings, with a horizontal joint through the crankshaft axis. All bearings are supported by the upper half, the lower half serving only as an oil pan. Lugs are provided on the crankcase for attaching a sod pan, thus eliminating the need for supports on the main frame. The crankcase and oil pan form a bell housing over the flywheel and will take any standard transmission suitable for No. 3 S. A. E. bell housing.

Special interest attaches to the oiling system employed. For truck purposes a single piece oil pan is employed, which is divided into an upper and lower compartment by means of an easily removable plate. This feature enables the oil reservoir to be thoroughly cleaned when required, with a minimum of effort. For tractor purposes a two part oil pan is provided, which gives easy access to the bearings for adjustment. Upon taking out a few bolts, the lower half of the oil pan can be removed. This part is provided with a settling chamber in which all abrasion from the bearings or any other solid particles may settle, and at the lowest point of this settling chamber there is a drain plug. A feature that will be readily recognized as of great value in a tractor engine is that the connecting rods and pistons may be removed from the engine without taking it out of the frame or disturbing any other parts.

The engine is designed for three-point support. There are two rear supporting arms cast integral with the bell housing, designed for main frame support. The forward end of the engine is supported by a trunnion, intended to rest upon a drop cross piece of the frame.

The engine being of the "L" head type, all valves are operated from a single camshaft, and the whole valve mechanism is enclosed. Valves of liberal size are employed, both sets having an effective diameter of 1½ in. The ends of the stems are hardened, and oil tempered valve springs are used. Valve stems and push rods work in separate removable bushings. A

removable cylinder sideplate covers the valves. Mushroom type cam followers are used.

The pistons are of cast iron, ground to size and provided with recesses and drilled with oil relief holes to prevent smoking. A balancing pad is provided in the piston casting, by means of which the weights of all pistons can be equalized. The piston rings are ground on the circumference and on both sides, and they have a diagonal cut. I-beam section connecting rods are used, of open hearth steel, drop forged and heat treated. The upper end of the rod is bushed with phosphor bronze and the lower end is fitted with a bearing consisting of a bronze shell and babbitt lining. Each connecting rod cap is held in place by four bolts, and the weights of all connecting rods are equalized.

Camshafts and cams are forged in a single piece of open hearth steel and are casehardened and ground. At one end of the shaft there is a flange to which the timing gear is bolted. The crankshaft is forged from open hearth steel, heat treated, machined and balanced on a Norton crankshaft balancing machine and drilled for the force feed oiling system. By means of the heat treatment to which the crankshaft is subjected, an elastic limit of 85,000 lbs. per square inch and an ultimate strength of 120,000 lbs. per square inch are obtained. The crankshaft has three main bearings, of the following dimensions: (front to rear)  $2\frac{1}{2} \times 3\frac{1}{4}$ ,  $2\frac{1}{4} \times 2\frac{1}{4}$ ,  $2\frac{1}{4} \times 4$  in. The connecting rod bearings are  $2\frac{1}{4} \times 2\frac{1}{4}$ . Characteristic of the principles of design of this engine is the fact that the connecting rod's center to center length is  $12\frac{1}{4}$  in., or considerably more than twice the stroke.

The set of timing gears, composed of four gears, one cam, one idler, one pump shaft and one generator gear, are made with extra wide faces ( $1\frac{1}{2}$  in.) and are cut with helical teeth, a refinement which is usually considered unnecessary in tractor engines. The gears are hobbled and great pains are taken to assure accurate centers, so their operation should be practically noiseless. The gears are easily accessible upon removal of the gearcase cover.

All main bearings are of the bronze-shell, babbitt-lined type, while the camshaft bearings, three in number, are die cast babbitt bearings. All bearings are accurately reamed and scraped to a perfect fit. A centrifugal type of water pump is provided, having a large bronze runner. The water pipes are short and of simple form, and are so arranged that it is unnecessary to bend the hose. A fan bracket is cast integral with the gearcase cover and is designed for mounting a radiator fan driven by a 2-in. flat belt.

A cast iron exhaust manifold is used and is provided with an expansion joint at the outer end. The intake manifold is cast integral with the exhaust manifold, thus insuring the proper heat supply for burning low-grade fuel. A special

design of combination exhaust and intake manifold is furnished where it is desired to burn kerosene. Both manifolds of course are located on the same side of the engine block, and the inlet manifold is designed to take a  $1\frac{1}{4}$ -in. vertical outlet carbureter.

The flywheel is secured to the crankshaft by means of six steel bolts passing through a flange integral with the crankshaft. The flywheel regularly furnished with the engine will accommodate any of the standard clutches used in connection with a No. 3 S. A. E. bell housing.

Lubrication is by full force feed to all bearings through a drilled crankshaft. This system is of the self-contained positive pressure feed type, with a pressure regulating valve, the oil being pumped from the oil reservoir, which is located underneath the crankcase, by a geared type pump and forced through a pipe to the main bearings, and from these through passages in the crankshaft to the connecting rod bearings. The camshaft bearings and piston pins are also lubricated through passages connected with the pressure feed system. The cylinder walls are lubricated by oil thrown off from the lower ends of the connecting rods. A special lead from the pressure system extends into the timing gear housing.

Almost any make of ignition, starting and lighting outfit can be readily mounted on the engine. The crankcase is arranged for No. 2 S. A. E. starting motor and lighting generator flanges on the left-hand side, while the water pump and magneto may be located on the right-hand side, looking at the engine from the front end.

The flywheel is 17 in. in diameter and has a rim  $3\frac{1}{4}$  in. wide. Different rim sections, however, are used, according to the purpose for which the engine is to be employed. For truck work a 76-lbs. flywheel is provided, while for tractor work a flywheel weighing 115 lbs. is fitted. The weight of the complete engine, with regular equipment, is about 800 lbs.

# High Altitude Airplane Photographs

*Of Some Interesting War Happenings*

*Zeebrugge Mole on the Belgian coast. The photograph, taken by the pilot in a Handley-Page machine, shows the result of his work. Lying in the water may be seen a destroyer on its side, sunk by a bomb from the airplanes. The photograph also shows a series of German destroyers in the water at the edge of the dock and four seaplane sheds with seaplanes in the air over the water*

*Zeebrugge Harbor. This picture, taken at low tide, shows clearly the two British ships sunk across the channel, blocking it so that German submarines could not get to sea. A German dredge may be noticed working alongside one of the sunken vessels. All four of these photographs were taken at altitudes of from 17,000 to 20,000 ft.*

*City of Metz attacked by airplanes. Direct hits made on the Metz railroad stations and railroad line. In this photograph clouds must not be confused with the smoke of the airplane bombs. The airplane bombs exploded directly on the railroads and near them, and are shown by the small light puffs of smoke, of which there are eight in number*

*The City of Cologne, while being bombed by a Handley-Page airplane. The smoke denotes the explosion of the bombs. The heaviest smoke marks the bomb which exploded as the photograph was snapped. Near the center of the photograph and toward the railroad line may be seen a bomb falling*

## Official Guide for Airplane Inventors

(Continued from page 271)

ducing the size of the orifice through which the liquid flows or by reducing the equivalent head of the orifice, which latter can be reduced by making the pressure in the float chamber dependent upon the pressure above the carbureter throttle or by adding more air to the carbureted mixture above the mixing chamber. These functions are carried out automatically in two types of carbureters so far developed. One of these, made by the Zenith Carbureter Co., Lyons, France, comprises a barometric capsule which through a linkage operates a valve regulating the pressure in the float chamber. The other was developed by the Panhard-Levassor Co., Paris, France, and has a diaphragm acted upon by atmospheric pressure and by the pressure within the carbureter. The motion of this diaphragm controls an auxiliary air valve above the primary mixing chamber of the carbureter.

The temperature of the air and the density decrease at high altitudes, but the decrease follows no regular law. A change in temperature affects the quality of the mixture, since the viscosity of the fuel changes with the temperature and the quantity flowing through a fixed size orifice varies accordingly. The variation, however, of the mixture quality as a result of temperature changes is small compared with variation due to barometric pressure changes, and complication of any thermostatic arrangement for correcting the rate of gasoline flow or of air admission might outweigh the practical advantages gained. The value of any such apparatus would depend entirely on the practicability of the form in which it appeared.

Precompression of air supply for the engine is one of the chief existing problems. Apparatus for this purpose must operate reliably and be light in weight. It must have a very high mechanical and volumetric efficiency.

There is considerable room for experimental investigations in ignition. Spark plugs offer a problem, due to the fact that modern engines develop explosion pressures of 400 to 600 pounds per square inch and m.e.p. of 120 to 135 pounds.

Insulation must be capable of withstanding great temperatures and the plug must not leak. Spark points of the plugs must be maintained at a high enough temperature to prevent carbon accumulation on them and yet their temperature must not be high enough to cause pre-ignition of the combustible charge. Consequently, spark points must be maintained within a definite temperature zone. Spark points in plugs now used have so low a temperature at low engine power that the points carbonize and short-circuit the plug. This carbonizing can be corrected by a better system of lubrication. Heating and expansion of the insulated electrode causes cracking of the insulator and the fact that all good electric insulators are poor heat conductors makes it difficult to keep the temperature of the insulator down. The chief difficulty in the present ignition systems is too high weight.

Engine parts are now considered reliable. Failures of parts of French aircraft engines 1915-16 were less than 2 per cent of the total number and 30 per cent of these were due to hits by projectiles.

Efficient self-starting systems, either of air, electric or powder shell types, are sought. The starters are usually applied to the engines on seaplanes, which do not operate at high speeds or high elevations, and are separate from the engines in all other planes. The weight is a serious factor. An air starter has in some instances been used, fitted to the engines in fighting planes which make use of an air bottle for supplying the necessary air under proper pressure. This air is either led through a distributor to the engine cylinders or operates a multiple cylinder air engine connected with the crankshaft by means of an overrunning clutch. It is suggested that a plan now used on gasoline railway cars, by which the engine is started by a charge of black powder detonated by a special mechanism in the cylinder head, may be further developed, although the problem is difficult in engines with a large number of cylinders.

Exhaust mufflers of light weight, effective in muffling and able to withstand excessive heat would be desirable. The

mufflers could not interfere with the cooling of the exhaust valves by radiation and conduction. Aircraft engines have 200 to 600 shaft horsepower, and since the heat constantly passing out of the exhaust gases is at a rate equal to twice the useful power, it makes muffler construction difficult. An aviation muffler would require at least ten times the power of an automobile muffler, which is called upon to radiate 10 per cent of the amount of heat which would pass through the aviation muffler.

Fuel storage and supply systems are not yet satisfactory. The arrangement of the fuel tanks and lines, and methods of fitting the tanks to the engines, are unsettled features of aircraft construction. Suggestions have been made to make the tanks and lines of steel to make them bullet proof. The weight is an objection, but this may be overcome by developing special alloys possessing little weight and great strength.

Gasoline having a boiling point not exceeding 250 degrees Fahrenheit is the only successful fuel used in airplane engines thus far. Hydrocarbon fuels of the higher boiling points crack or become dissociated under high temperature and pressure. A fuel which carried the oxygen required for its combustion would eliminate the effect of altitude and the temperature of the atmosphere upon the power of aviation engines.

There is room for improvement of the various instruments devised for aircraft, including the barographs indicating and recording the altitude, drift meters indicating the side slip of the plane, inclinometers indicating the angle of the plane, tachometers indicating the engine speed, oil, gasoline and water gages indicating the temperature and pressure of these fluids, and speed indicators which indicate the speed of the plane relative to the air through which it is traveling.

Two instruments which would be exceedingly valuable would be one giving the speed of the plane relative to the ground and one showing the altitude of the plane above the ground. Pilots flying at night with a barograph can only know their altitude above sea level, and when over strange country, if they fly at low elevations, they are not certain that they are at a safe altitude.

Dr. W. F. Durand, discussing aeronautical problems in the bulletin, points out the need for better materials for airplane construction, improved engines, pitch adjusting propellers, improved spark plugs, parachutes, stabilizing devices, self-starters and aeronautical instruments.

The development of wing curves of a high speed type which will have a small center of pressure movement through large angles of incidence and development of wing curves of greater lift-drift ratio are important. To engage in experiments of this nature it will be necessary to use wind tunnels which give wind speeds exceeding 100 m.p.h.

Airplanes can be improved, according to Mr. Stout, to allow greater visibility, greater gun range, quicker maneuvering and better stability. The range of flying speed can be increased to minimize landing danger. Fuel consumption can be minimized by further elimination of parasite resistance. Airplane construction should be investigated for possibilities of lightening the planes and to change them from their present kite-type construction to more stable design.

Wooden propellers are far from satisfactory, though as yet no substitute has been found. Propellers would be desirable which would permit motors to operate at the best speed (around 2000 r.p.m.) without requiring gearing down from motor to propeller.

The compass used in airplanes to-day is far from satisfactory. The gyroscope is not yet developed in light enough form. Possibly airplanes of the future will be steered along wireless rather than magnetic lines with definite control between cities.

Bullet-proof tanks are desirable. Otherwise the airplane engine—the Liberty engine—says Mr. Stout, is proceeding satisfactorily, its excellent development being due to standardization and to the fact that our program comprises but a single type.

# An Improved Elastic Limit Recorder

Consisting of an Attachment to a Standard Testing Machine by Means of Which One Person Can Accurately Determine the Elastic Limit of Specimens Both in Tension and Compression

THE method usually employed heretofore in making elastic limit determinations required three persons, one for reading the elongation with an extensometer, another for operating the testing machine and the third to note down the data. The method is, therefore, hardly suited for commercial work where quick results are wanted.

An improved instrument, due to the late J. M. Summer, has been in use in the physical testing laboratory of the Westinghouse Electric & Mfg. Co. at East Pittsburgh for some years, and was described in a paper read at the recent annual meeting of the American Society for Testing Materials.

This recorder may easily be applied to the standard testing machine, and by its use a single person can accurately determine the elastic limit of any sample that is being tested in tension or compression.

The apparatus consists of a semi-automatic load-indicating mechanism which is attached to the testing machine by means of a frame. The recorder can be moved to the right or left and fastened securely in any desired position by means of a set screw. The vertical rows of holes in the standards at each end allow the recorder to be raised or lowered at will.

Attached to the weighing poise is a card graduated to conform to the graduations of the beam, the range being from zero to 12,000 lb., with a minimum reading of 100 lb. This allows a standard 4 by 6-in. filing card to be used, and the results are sufficiently accurate for commercial work. As the limit of accuracy of weighing on a testing machine of 100,000-lb. capacity is about 50 lb., it might be desirable to have the minimum reading of the card 50 instead of 100 lb. This can be easily accomplished by increasing the length of the card to 12 in. and reducing the weight of the poise one-half, thus doubling its rate of travel.

On the back of the card spaces are ruled in which may be recorded the serial number of the sample tested, ultimate (beam) load, elongation in 2 in., and the reduced diameter. After the elastic limit is determined the card is filed so as to be available in case a complete curve is subsequently desired.

The recorder is shown in detail in the cut. It is essentially a solenoid with a loosely fitting armature, A. When at rest the armature is at the bottom, as shown, but when current is flowing through the coil the center of the armature will be at the center of the coil. The adjustable screw, S, is set so that it will just touch the armature when it is in this position.

If the armature is at rest at the bottom of the tube and the circuit is closed it will be pulled up and its inertia will carry it past the center of the coil, so that it will hit the screw E a hammer blow. It will then drop to the center of the coil, where it will be held until the circuit is broken, when it will drop to the bottom of the tube.

The bell crank, D, is pivoted at P, so that when the armature hits S the motion is transmitted to the prick punch B, which is driven sharply against the card in the holder, H, making a small pin hole in the card and immediately returning to its normal position, allowing the card to continue its movement. A light spring on the crank assists it in returning to its normal position.

In the bottom of the tube is a short spring which acts as a shock absorber for the armature. A clamp, E, on the side of the recorder serves to mount it on the frame.

The frame consists of two upright pieces fastened to the machine, with a crosspiece on which the recorder is mounted by means of clamp E. The recorder can be slid along this crosspiece in order to set it so that it starts at the zero point; and also in order to reset it, which is necessary when

the load at the elastic limit exceeds 12,000 lb., as the record must then be run across the card a second time.

The uprights have holes drilled about  $\frac{1}{2}$  in. apart so that the height can be adjusted and the position of the recorder changed. In this way several tests can be put on one card.

A push button for operating the recorder is located where the operator can conveniently reach it while he is watching the extensometer.

The card holder is made of aluminum and is fastened securely to the poise. A hole is drilled in the poise to remove a weight equal to that of the holder.

When using the recorder, the test specimen is placed in the machine in the usual way, with the extensometer in position. The card is then placed in the holder and fastened so that it cannot shift. The poise is then set so that the beam reads zero load and the recorder is slid along the cross bar until when the button is pressed the punch mark is on the zero line on the card. The recorder is clamped in this position, the machine started, and the operator stations himself at the extensometer. When the extensometer shows predetermined elongations, such as 0.0002, 0.0006 in., etc., he presses the button. As the card attached to the poise is moving in front of the recorder, which is stationary, and as the card is graduated to correspond to the beam, the punch marks will indicate the load at which the elongation is measured.

The operation is continued until the elastic limit is reached, after which the extensometer is removed and the yield point determined. The test is completed in the usual manner, the record being made on the back of the card.

For the next test, the recorder can be moved down to the next position, and in this way five or six tests may be grouped on the same card. After the tests are completed the card is removed and curves plotted. The elastic limit or proportional limit is determined from the curves, the points of which will be found to be very regular.

With this apparatus, elastic-limit determinations can be accurately and rapidly made and if the card is filed a complete record of the test is available at any time.

Summer elastic limit recorder

## HOMELESS AGE SUBSCRIBERS

Subscriptions for the Homeless Age transferred to the subscription list of AUTOMOTIVE INDUSTRIES in the merger of the two publications will be completed in full by the weekly issue of AUTOMOTIVE INDUSTRIES to the dates of expiration shown on the records of the Homeless Age Co.

Owned by United Publishers Corporation, Address 243 West 39th St., New York; H. M. Swetland, President; Charles G. Phillips, Vice-President; W. H. Taylor, Treasurer; A. C. Pearson, Secretary.

Entered as second-class matter Jan. 2, 1903, at the post-office at New York, New York, under the Act of March 3, 1879.

Member of the Audit Bureau of Circulations.

Automotive Industries-The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

## Standardizing Tractor Parts

THE fact that the majority of new tractors seen at the Salina demonstrations used standardized types of robust automobile or motor truck engines made especially stout to meet tractor requirements is proof that a new maker generally buys the best goods that are on the market. These same makers were not able to purchase standardized front axles, frames or other parts, and hence were forced to design and manufacture something of their own. Stronger arguments for arriving at some fairly definite conception of tractor parts could not be asked for. Herein lies a profitable field for the parts maker, and the first man in the field with a real job will have a good start on other competitors. There is room for nearly as much similarity in front axle tractor design as in front axle truck design. The same can be said of tractor steering gears. The lack of some definite form of tractor frame has led to a few serious engineering errors in

some new tractors. To-day the trend of tractor design is sufficiently well defined so that the parts maker can design a job that will meet the requirements of a great many firms.

## Handicaps of the Aircraft Inventor

OF late numerous inventors have been turning their attention to aircraft, because inventive effort in this field has been encouraged by our Government. Unfortunately it is a very difficult thing for the individual inventor, not connected with the aircraft technical service, to do effective work, for the reason that he cannot be familiar with the latest practice in military aeronautics. Aircraft development has progressed to a considerable extent along certain lines, and for the purpose of the present war there is practically no chance that any radical innovations such as engines functioning on other than the ordinary cycles or plane constructions sustained by other means than the lift on wings inclined to the direction of propeller thrust will be of any practical use, as it would take too long a time to reduce such innovations to a production stage.

Aircraft development will take place along the lines of detail improvement. Improved designs will be gotten out in which the material will be disposed to give greater strength in the directions where strength is needed and in which the parasite resistances will be reduced. But the untrained inventor can do little along these lines, because it takes experience and training to judge the distribution of strains in a complicate structure like an airplane.

In the simpler elements of the airplane, such as turnbuckles, cable loops, etc., standardization has been carried through to a considerable extent, to facilitate production and replacement of parts, and change in design is not greatly desired, though if sufficient advantage can be shown the standards will, of course, be modified.

Much inventive ingenuity is also being spent on devices intended to preserve the life of aviators, these taking the form of gyroscopes or other automatic stabilizers, or of parachutes. While the motive behind these efforts is most praiseworthy, the fact is that anything which materially reduces the speed and climb cannot be tolerated on a fighting machine, as it might be a danger rather than a safeguard.

It will thus be seen that the path of the inventor who wants to perfect military aircraft is strewn with difficulties. There will undoubtedly be much waste of effort in a fruitless search for radical improvements in design. Much as one would like to avert such waste, it would not be good policy to discourage inventive effort in this direction because it has been the general experience that occasionally sound practical ideas pertaining to an industry came from persons entirely outside of it, and one improvement thus achieved might more than pay for the effort wasted on hundreds of impractical ideas. The problem is to guide invention into the proper channels.

## A Suggestion for Our National Shows

By David Beecroft

**W**HY should not the national automobile shows this year take the form of national automotive exhibitions of what the automotive industries have done as direct war work in the development, manufacture and production of automotive apparatus?

Let the Grand Central Palace and the Chicago Coliseum be converted into exhibits of this war machinery.

Let the exhibits contain as much airplane apparatus as it is possible to display. There are many types of aviation engines; there is a great volume of equipment for airplanes; there are our training planes; there are our fighting planes that have already been seen by hundreds but which should be seen by hundreds of thousands; there are many parts entering into the airplanes that could be separately shown.

But aviation is but one small aspect of such an automotive exhibition. The volume of new types of artillery tractors developed by the ordnance department should all be exhibited. These have been publicly shown in a few places, but they, too, should be shown to the hundreds of thousands that might attend a national show.

Besides aircraft and ordnance there is the motor truck in all of its many forms. The government has labeled it a 100 per cent essential in war. It should be shown in all its phases of usefulness.

The farm tractor, which has become the veritable industrial tank for our armies of agriculturists, should be shown. Our city populations are strangers to it. Nine-tenths of the country has not a speaking acquaintance with it. It is a part of the automotive field, a new member of the circle of automotive industries, and as a war machine stands side by side with the airplane, with the artillery tractor, with the motor truck, with the motorcycle and with the automobile.

With such an array of war-time exhibits a great educational propaganda could be started. Our people must be more familiar with our automotive war apparatus. The more people who would see our airplanes the more sane would be the attitude of the public on airplane questions. Educate our people on airplanes for training and fighting uses, and they are better judges of airplane rumors. Such an education would be one of the best possible guarantees against so many of the malicious rumors that have infested the nation in the last 10 months.

Make such a great war automotive exposition popular to the last degree by giving all receipts above expenses to war organizations. Give the receipts for one day to the Red Cross. For other days divide them among the Y. M. C. A., the Salvation Army, the K. of C. and other war activities that are worthy of support.

Would such an exposition not be one of the greatest demonstrations to the nation of what these industries are doing for the war?

Would not such a demonstration convince hundreds of thousands directly, and perhaps millions indirectly, of the value of the great automobile industry, so often wrongfully designated a pleasure car industry, to this nation and all our Allies?

If such a great demonstration of war apparatus were not possible then the New York and Chicago shows could be staged to represent two at least of the automotive industries that are in the 100 per cent essential column, namely, trucks and tractors.

Again the West has been in the van, and for several years has been staging automotive apparatus together in a single show. The automobile has not for years held the stage in the great distributing centers such as Twin Cities, Kansas City, St. Louis, etc. In these cities trucks, which were relegated out of the New York and Chicago shows, have always been in these Western shows. Boston has seen very clearly the eventual in the truck field and has always insisted on the truck show, and has each year held a successful one. New York and Chicago have been the only centers where the truck was legislated out of the show.

This year unquestionably the truck and the tractor will hold their well-established places in the Western show circuits, and it is fitting that these two greatest national necessities should be introduced face to face with the citizens who would attend the two great population centers of the nation.

# □ Latest News of the

## Manufacturers Look for Only 75% Cut

But Are Ready to Accept 100 Per Cent Curtailment if Necessary

DETROIT, Aug. 13—The shock caused by the War Industries Board when it announced the possibility of curtailing passenger car production 100 per cent has passed away and the situation is viewed with clearer vision by the manufacturers, though it is still regarded as most serious.

The decision is not looked upon as an order by the manufacturers, and they are waiting to see what the outcome will be. The War Industries Board's reply to the letter sent by the National Automobile Chamber of Commerce simply brought to a head an issue which has been pending for some time.

If it is necessary for the Government to utilize their plants to 100 per cent capacity, the manufacturers are ready to hand them over regardless of the hardships it may cause the passenger car business and its distributing organization.

Pending a decisive step to be taken by the War Industries Board and the issuance of an official order manufacturers will continue producing cars as their ability permits. Of course it is too early to even hazard a guess, but manufacturers think they will be allowed to remain in production, however small the extent may be, and do not believe the cut will be so drastic as the decision seems to indicate.

Until the questionnaires which have been sent out by the War Industries Board have been returned and an analysis of the situation has been made, manufacturers do not expect to know definitely whether or not a 100 per cent curtailment will follow. It is their firm belief that plants will be engaged in war work to a greater extent, but production may not reach 25 per cent of normal.

The data and information which the War Industries Board requested on July 16 have not been completed by the majority of manufacturers and, according to their understanding, are not due until Aug. 15. Owing to this fact very few manufacturers were able to state at this time just how much inventory they have on hand.

The Hupp Motor Car Corp. stated it had enough big parts in stock to last at least 12 months, but of the smaller ones some had less than a month's supply. The same conditions prevail with most of the larger manufacturers. In-

ventories were never so unbalanced. The Liberty Motor Car Co., however, reports a well-balanced stock, and is in a position to maintain production for 4 or 5 months without buying more.

The Ford Motor Co. is very reticent concerning the situation. It states that no plans have been made and that it will continue production until the Government tells the company to do otherwise. It will be remembered that 75 per cent of the capacity of this company is engaged on war work. The daily commercial production is now 750, of which 350 are passenger cars.

The biggest portion of Dodge Bros. plant is engaged on war work, and further orders are constantly being added. The officials declined to make any comment on the proposition, and it is difficult to state what their attitude is.

According to Hugh Chalmers, vice-president of the National Automobile Chamber of Commerce and representative of that organization in Washington, who has just returned to Detroit, there is no desire on the part of the War Industries Board to put the automobile industry out of business, yet it is the War Industries Board's contention that having the industry go on a 100 per cent war manufacturing basis would be an ideal condition.

Assurances were given Mr. Chalmers that if steel is available after war industries needs have been satisfied, the motor car manufacturers will get their share.

The common error in thinking that the automobile industry uses only 5 per cent of all the steel produced in this country should be corrected. It is not this steel that plays such an important part in the manufacture of cars. It is the special steel—chrome nickel, vanadium, etc.—that is the bone of contention.

Mr. Chalmers addressed the following letter to the members of the National Automobile Chamber of Commerce:

"Supplementing what Alfred Reeves has written to you with reference to the letter from the War Industries Board, it is only fair to say that we did not know that any publicity would be given to this letter, because we were assured by the members of the board it was not their intention to give any to this subject. They denied having given out any of the objectionable publicity in the past and agreed with us that we should have as little as possible.

"The attitude of the War Industries Board was this:

"It was very much pleased at the spirit shown by our members in voting for the 50 per cent curtailment of passenger cars, but it felt it could not accept that agreement without obligating itself, indirectly at least, to give us materials on a 50

(Continued on page 302)

## Production Reduced in Detroit District

Some Manufacturers Are Close to the 25 Per Cent Line, Others Still Lower

DETROIT, Aug. 9—The most marked change in this territory in the passenger car manufacturing field is the gradual reduction of production. Many manufacturers are nearing the 25 per cent line of production; some have already arrived at this figure. Whether this output will be reduced still further is a matter of conjecture. Manufacturers are reticent about making any prophecies regarding the future. They will continue production up to the limit of their ability to secure materials, many feeling optimistic about the situation, and believe relief of the strain under which they are laboring is close at hand.

Production of the Willys-Overland, Inc., averages 400 daily; that of the Paige is 35; Reo has reduced its production 50 per cent compared with a month ago. It is now 40 cars per day, while the output of the speed wagon is 25 daily. Buick's production is in the neighborhood of 175 daily; Chalmers, 50; Harroun is reported at 10; King averages also 10; Liberty produces 7, and Scripps-Booth, 40. Ford passenger cars come out at the rate of 350 a day and the trucks at 400. Packard, Hupp, Briscoe and Columbia production figures are the same as reported a month ago.

Production of the Cadillac goes entirely to the Government. This was curtailed Aug. 1 from 40 cars daily to 25. This latter figure represents what was going to the Government. With the curtailment of production it is apparent that no cars are going into the commercial field from this plant.

## Navy Contractors Asked to Ship Early

WASHINGTON, Aug. 13—The Bureau of Supplies and Accounts of the Navy Department requests all navy contractors and others engaged directly or indirectly in the purchase, shipment and storage of navy material and supplies to endeavor to move all materials and supplies possible prior to the winter season so as to prevent freight congestion during the colder months. The statement adds that while the railroads are now handling considerably more traffic than usual and will increase freight equipment and terminal facilities, it is possible that we will experience unusual severe weather again this coming winter, which would tend to hamper freight shipments.

## Trucks Are Classified Among Utilities

Priority Board Recognizes Industry as Essential—Manufacturers to Make Monthly Reports Giving Details of Commercial Vehicles Made and Sold

WASHINGTON, Aug. 9.—Motor trucks used directly or indirectly for war purposes are war essentials and their production for such purposes will be facilitated. Motor trucks employed in essential uses in civilian industry constitute an important transportation medium, and curtailment for such uses should be avoided as far as possible. Manufacturers of motor trucks whose factories are exclusively devoted to producing products absorbed directly or indirectly by the Government or in other uses of essential importance will be given class B-4 rating for steel requirements, conditioned, however, that the manufacturer will observe a pledge of co-operation and the regulations of the Priority Board. These statements form the salients of a circular now being prepared by the War Industries Board for distribution to manufacturers of motor trucks, which outlines the assistance they will receive from the Priority Division in the manufacture of trucks.

### Will Define Essential Uses

The circular will specifically define essential and non-essential uses of trucks. It states that the demand for iron and steel is such that no guaranty can be made to the motor truck or any other industry that its steel requirements or any operation thereof will be met. However, the members of the motor truck industry, states the circular, who comply in good faith with the pledge of co-operation will be accredited the class B-4 rating in procuring their supplies of fuel, iron and steel. The B-4 rating insures the issuance of priority certificates, and places the motor truck well up in front in the list of very important steel consumers.

The Priority Division will receive application of any manufacturer of motor trucks for a place on the preference list for fuel, in each instance taking into consideration the fuel situation of the manufacturer, the amount of his direct and indirect Government business, and the uses to which the remainder of his produce is being devoted.

Any motor truck manufacturer whose factory is now or in the future will be exclusively devoted to making products absorbed either directly or indirectly by the Government or otherwise of essential importance, and whose fuel requirements and output bear economical rela-

tion to each other, will be placed upon the preference list for fuel, providing he observes the pledge of co-operation and regulations.

Any manufacturer of trucks who believes that he is entitled to an even higher rating than B-4 for securing steel requirements to complete any part of a contract or order, may make a formal application for the higher rating to the Priorities Division.

The manufacturer's pledge applies also to the uses of steel already in his possession, and to manufactured or partly manufactured trucks in his possession at the time the pledge is made.

### Pledge of Co-operation

The pledge of co-operation to be given by any motor truck maker who desires to be placed on the preference list for fuel, and in class B-4 for steel, is as follows:

"The undersigned hereby pledges itself (1) to use only in the manufacture of motor trucks or repair parts for motor trucks the steel suitable therefor which is now in its possession or which may hereafter come into its possession; (2) to sell no motor trucks of its manufacture except (a) for essential uses as that term has been or may be defined or applied by the Priorities Division of the War Industries Board, or (b) under permits in writing, signed by or under authority of such Priorities Division; (3) to sell no user an unnecessary number of motor trucks even for essential uses; (4) to discourage the purchase of any motor truck to replace a usable truck already in service and to give maximum encouragement to the repair of trucks; (5) that this pledge shall bind not only the undersigned but also its branch houses; subsidiaries, dealers, brokers, factors, commission merchants and all other selling agencies; (6) to make no delivery of any motor truck to any one for resale, either directly or indirectly, until such one has filed with the undersigned its pledge of co-operation in writing; and to make monthly reports as required by the War Industries Board to the Automotive Products Section of said Board or otherwise as said Board may direct."

The manufacturer must also require from anyone to whom he delivers a motor truck for resale a subsidiary pledge in much the same terms.

Each manufacturer must forward dur-

ing the first fifteen days of each month a sworn report to the Automotive Products Section of the War Industries Board showing the number of motor trucks manufactured in the preceding month, the number delivered to the United States Government and its allies, the number on hand, the approximate stock of steel on hand and such other information as may be required. These reports will be held confidential by the Board unless the public interest shall require otherwise.

The creation of new plants or the expansion of existing plants for the manufacture of motor trucks is held to be unnecessary and undesirable inasmuch as existing facilities are ample to produce all the trucks required for essential use or for which steel can be furnished.

The original plan of creating a list of essential truck users as was announced earlier in AUTOMOTIVE INDUSTRIES has been given up for the time being. The Priorities Division has preferred to believe in the good faith of the manufacturers and distributors of motor trucks and is leaving the determination of an essential consumer to them.

### Makers' Monthly Reports to Guide Board

The monthly report of the manufacturers to the Automotive Section of the War Industries Board will be used by the Priorities Division to check the essentialness of the sales of trucks. If it should develop that any violation of the rules and sales are made to non-essential users, the Priorities Division will be obliged to limit the sale of trucks by means of a certified list of purchasers.

The Class B-4 rating comprises orders and work which, while not primarily designed for the prosecution of the war, are, however, of public interest and essential to the national welfare or otherwise of exceptional importance according to the definition of Class B by the Priorities Board.

Applications for priorities certificates are to be made as heretofore by each individual firm to the Priorities Division of the War Industries Board, Washington. The board will furnish the necessary blank forms for this purpose.

### June Exports High for Detroit District

DETROIT, Aug. 13.—The exports from the District of Michigan for June have attained a high record. Among other things the following classes were listed: Automobiles and parts, \$1,500,142; raw cotton, \$1,269,731; iron and steel and manufactures thereof, \$1,678,804. The exports to France were almost all covered by automobile tires, adding machines and sawed lumber.

## New York's Export Figures Improve

Over Half of All Automotive Exports of U. S. Pass Through Metropolis

NEW YORK, Aug. 9.—New York's position as the principal port of export continues to improve, although the figures for June are still slightly below those of January and February. During June the total value of cars, trucks and parts shipped to foreign countries from New York represented 54 per cent of the total automotive exports exported from the United States. In May the New York percentage was 43 and in April the proportion was but 24 per cent.

Automobiles, trucks and parts exported through New York in June totaled \$3,633,577, as against \$3,339,588 in May and \$2,396,448 in April. Passenger cars were valued at \$1,495,346; trucks at \$1,370,955, and parts at \$767,276. The May values were respectively \$1,289,109, \$1,280,606 and \$769,843.

An interesting feature of the June exports is the good showing made by Latin

American countries, Argentina, Brazil, Chile and Uruguay in particular. As a matter of fact Chile was our best car customer for the month.

### A Special Flag for Private Factories

WASHINGTON, Aug. 12.—Every private factory in the United States, devoting more than 50 per cent of its total output to ordnance material, is to have the privilege of flying a specially designed flag. Orders to this effect have been issued by Major General C. C. Williams, U. S. A., and managers of the various ordnance production districts have been requested to inform the Ordnance Department at Washington of the number of plants affected.

The flag measures 4 ft. by 6 ft. Around the 4 sides is a red border. Within this border are 3 broad panels, the center one blue and outer ones white. In the middle of the center panel of blue there is a design in white of the Bursting Bomb, insignia of the Ordnance service.

### Pierce-Arrow Makes Big Profit

BUFFALO, Aug. 8.—The Pierce-Arrow Motor Car Co. reports operating profits of \$1,523,421 and net profits of \$914,029 for the three months ending June 30.

## American Haviland Undergoing Trial

Division of Aeronautics Inaugurates Severe Flight Tests for Plane and Engine

WASHINGTON, Aug. 9.—On a flight to test the American de Haviland-4 equipped with a Liberty 12 engine, two officers of the Air Service left Washington this afternoon at 4.20 for Philadelphia. This test is being made by the Division of Military Aeronautics and the two officers making the flight are Major W. C. Oker and Second Lieut. L. Deutsch. These two officers started originally from Dayton, Ohio. They had made 2 flights from Dayton to Mt. Clemens, Michigan, and return, and one to Camp Perry and return, when on Saturday at 1.14 p. m. they left the Dayton Field and headed direct for Washington, D. C.

At 3.45 p. m. they were 20 miles north of Harrisonburg, Virginia, where they landed for gas, but decided to stay over night. Leaving this location early the next morning they landed on the Polo Field at Potomac Park, Washington, an hour later, making the total flying time from Dayton to Washington in 3½ hr.

Leaving Washington that same afternoon, they made Philadelphia in 58 minutes. Returning to Washington Monday afternoon, they left again for Philadelphia this afternoon. From there they start for Mineola, and will eventually start back for Dayton from the Long Island Field.

Besides testing plane and engine the two officers are testing compasses. The plane carries a spare propeller strapped underneath the fuselage and an extra landing wheel inside. The plane has covered over 2000 miles in the last 2 weeks with no engine trouble and it will be driven until it shows engine or body weakness. The idea is to give the plane and engine as hard a test as possible.

In addition to the extra parts they carry, the officers also have their personal luggage, one idea being to keep the total weight supported up to approximately that of battle flying.

From Dayton to Washington the officers flew entirely by compass, passing over Alleghany and Blue Ridge Mountains at an elevation of about 19,000 ft., and in crossing West Virginia they were above such thick clouds that they did not see that State at all.

### Export Licenses for Sweden Will Be Considered

WASHINGTON, Aug. 10.—Applications for exportation of all commodities to Sweden will now be considered by the War Trade Board.

Exporters in the United States before filing applications for export licenses must obtain from the prospective importer in Sweden advice that there has been issued by an appropriate importing

AUTOMOBILE, TRUCK AND PARTS EXPORTS FROM NEW YORK FOR JUNE

association, or by the Statens Handels Kommission, a certificate covering the proposed consignment. The number of the certificate should be forwarded by the importer in Sweden to the American exporter. This number should be specified on Supplemental Information Sheet X-104, which must be duly executed and annexed to the application for an export license.

Applications for licenses to export to Sweden commodities for which a Handels Kommission certificate or an importing association certificate is required will be considered only in the event that the said certificate has been issued subsequent to June 14, 1918. Certificates issued prior to that date will be treated as void.

#### Ford Plans Mexican Tractor Factory

WASHINGTON, Aug. 9—Henry Ford has submitted a plan to President Carranza of Mexico for the establishment of a plant in that country to manufacture Fordson tractors on an extensive scale. The idea is to instruct Mexican mechanics in Ford factories in this country in the first instance and then send them back to Mexico to operate the new factory.

Tractors will be sold to farmers at practically cost price on terms which will permit of their being paid for out of the increased crops made possible by their use. Mr. Ford states that his sole object is to benefit Mexico, and that any profit which may be made will remain in that country.

It is the intention to invest a considerable sum in the enterprise, several millions if necessary. No factory location has been chosen as yet, but investigation as to local conditions of transport, coal, etc., is being made. The fulfillment of this scheme will naturally reduce the cost to the consumer, who will save freight, duties, import charges, etc.

#### Goodyear June Sales Are \$13,562,915

AKRON, Aug. 12—The gross sales of the Goodyear Tire & Rubber Co. in June amounted to \$13,562,915. Although this total is somewhat lower than for the two preceding months, it makes the total gross for the eight months up to the end of June, \$88,390,432. The remaining four months, normally among the heaviest, should produce an additional \$50,000,000 at least, making the year's business reach \$140,000,000. In the 1916-1917 year, Goodyear transacted \$111,450,000 worth of business.

Practically every product of the company is used extensively by the Government for war purposes. The increase in sales of motor truck tires alone will more than offset any decrease in the demand for tires due to the curtailment of production of passenger automobiles. Demand in all lines of manufacture exceeds production, which is limited only by the number of employees obtainable.

#### Dort Increase Stock to \$2,000,000

FLINT, MICH., Aug. 12—The Dort Motor Car Co. has increased its capital stock from \$1,500,000 to \$2,000,000.

## Bomb German Cities Intensively

### Successive Groups of 25 Planes to Be Dispatched at Frequent Intervals

WASHINGTON, Aug. 10—The feasibility and demoralizing effects of long range bombing were emphasized here by British fliers recently arrived from the front. They state the only way that Germany can be made to realize she is getting the worst of the war is by carrying the war right into Germany, and the quickest way we can do that is by air. Six of the principal manufacturing towns on the western frontier of Germany lie within easy bombing reach of the French and British lines. Raids already undertaken over German soil by the British squadrons operating from the Nancy area have had far-reaching results.

Gas, tanks and airplanes, it was pointed out, are the new features of this war. Gas and tanks can both be comparatively readily overcome by the use of gas masks and anti-tank guns. Aircraft, however, can only be fought to any effective degree by enemy aircraft. In consequence the possibilities, once the Allied air forces greatly exceed those of the Boche, are unlimited.

The following example was pointed out by a British aviator to show what can be accomplished, using a minimum quantity of men, machines and money:

"Given 500 machines each capable of carrying 1 ton of bombs and having a service radius of 200 miles—that is machines capable of dropping 1 ton of bombs on a given town within a radius of 300 miles from their base and returning.

"Select 1 single town within a 300-mile radius which if destroyed will vitally affect production of shells or other munitions.

"Divide the 500 machines into 25 groups of 20 machines each. To obtain the best moral and physical results, the raid must be continuous. Start the groups with intervals of 1 hour between them.

"Deduct as much as 30 per cent for engine failure, machines brought down by the enemy, and machines failing to find or reach the target (this is an exorbitant percentage to deduct. Under active service conditions 10 per cent to 15 per cent prove to be nearer the mark.) The result will be the dropping of 14 tons of bombs on the town selected, each hour, for 25 consecutive hours, that is a total of 340 tons of bombs. The effect on the doomed town can scarcely be imagined. It would be reduced to a complete state of ruin and chaos."

Another important factor, it was stated, to be taken into consideration in air raids is fire. The anti-fire equipment of the larger German towns is capable at the utmost of dealing with from 12 to 15 fires simultaneously, and by calling upon neighboring towns for assistance with about 5 more. This makes a total of 20. A continuous air raid for 25 hours would establish hundreds of fires, the vast majority of which would be left to burn out untouched.

It was said that if the air forces of the Allies were only sufficiently greater than the Germans to allow one attack each week upon a German town as outlined here, the end of the war would be in sight very soon.

#### Wire Wheel Corp. Gains Decision

NEW YORK, Aug. 8—The Wire Wheel Corp. of America has received a decision in the matter of its proceedings to restrain C. T. Silver of New York as agent of the Silver Apperson car from selling or otherwise disposing of a number of Fryer wire wheels purchased by the Apperson company from the Phelps Mfg. Co. It was held by Judge Hand of the U. S. District Court that there seemed to be but small doubt but what the Freyer wheel infringed upon the triple spoke patent, but that inasmuch as Mr. Silver had but a few cars fitted with these wheels on hand and no irreparable injury was likely to be suffered by the Wire Wheel Corp. he would deny a motion for a preliminary injunction if the defendant filed a bond in the sum of \$2,000 to cover such damage as might be shown to have been sustained by such infringement at the final hearing of the case.

#### British Austin Company now Employs 20,000

LONDON, Aug. 6—The Austin Motor Company has grown to be the largest British motor car manufacturing concern, rivalling Fiat for first place in Europe. It is said that the Austin Company now employs approximately 20,000 men as compared with 2500 before the war. At the annual general meeting of the company Sir Herbert Austin reported that during the past twelve months alone there has been an increase of 125 per cent in employees, and an increase of 65 per cent in assets.

Sir Herbert also stated that the post-war plans of the Austin Company are now entirely made. It is believed, as will undoubtedly be the case with other similar companies which have expanded beyond their normal growth, that in addition to their automobile and motor truck work, they will include certain definite branches of general engineering.

#### War Profits of British Motor Car Makers

LONDON, Aug. 10—According to information which has just been disclosed, seventeen of the leading companies in the motor and cycle group earned a total profit of \$5,725,540 in the twelve months ending June 30, as compared with \$5,278,590 for the previous year.

According to the same source of information the year's profits were distributed as follows: 38 per cent went to the common share holders, 16 per cent to the holders of preferred shares and 46 per cent to reserve.

#### Auto Indicator Increases Capital

GRAND RAPIDS, MICH., Aug. 10—The Auto Indicator Co. has increased its capitalization from \$15,000 to \$50,000.

## Against Increase in Freight Rates

N. A. C. C. Traffic Manager  
Argues Before I. C. C. on Proposed Schedule Changes

NEW YORK, Aug. 9—In behalf of automobile manufacturers, J. S. Marvin of the National Automobile Chamber of Commerce appeared yesterday before the Interstate Commerce Commission to argue against the proposed increases in freight rates applied to automobiles as promulgated by the Railroads Freight Classification Committee. The proceedings were a part of the investigation which the commission is making into the so-called consolidated classification case.

### Standardization of Carload Weights

For some time now the railroads have been working on the consolidated classification combining the Eastern, Western and Southern classifications into one for all territories with three different ratings, one for the East, another for the West and the third for the South. The chief object of this move is to standardize the descriptions of articles and the minimum carload weights. But it is also proposed to increase the rating on automobiles in the West 10 per cent or to make it 110 per cent of the first class freight rate.

Following a protest from the automobile manufacturers, it was proposed to draft a reclassification whereby freight vehicles or motor trucks will be separated from passenger cars in the West and given a reduced rating as second class under an advanced minimum carload weight of 12,000 lb. This proposed classification would not, however, satisfactorily provide for mixed carloads of freight and passenger cars and it is therefore likely that some further change will be suggested.

### What the Increase Would Mean

In his argument, Mr. Marvin showed that some of the principal manufacturers have figured that the proposed 10 per cent increase in the classification of passenger cars would amount to from \$50,000 to \$160,000 on their individual shipments based on a volume of business equal to that of 1917, and that the total additional cost on all automobile shipments into the West on the same basis would reach perhaps a million and a half dollars. This would be in addition to the 25 per cent general increase in freight rates which went into effect June 25 and he stated that the railroads as a whole would gain not less than ten million dollars by this 25 per cent increase on a normal year's production. It was brought out that the shipping of automobiles had grown from a small volume when the present classification was fixed to 300,000 carloads per year and that the average value of automobiles on the contrary had declined until it was but 45½ per cent of the average value seven years ago.

The use of automobiles in a utilitarian way by business men generally, doctors, army and Red Cross workers, farmers, contractors, builders and salesmen was brought out and supported by an ample array of facts and data. The evidence included a technical discussion on the shipping of automobiles and the furnishing of freight cars which does not rest as heavily at this time on the western lines as it formerly did.

### Freight Advancement Not Justified

The Commission was informed that the proposed classification does not adequately cover the shipping of automobiles as it now obtains with respect to loading which now exceeds the minimum carload weights, particularly on Western shipments, and it is, therefore, a much more desirable class of freight than it was heretofore.

In support of their action Chairman Fyfe of the Western Classification Committee pointed to the decrease offered in the rating on freight machines, but Mr. Marvin declared that this was long over due and had been contended for during the past several years, similar action having been taken by the Eastern and Southern lines long ago. It was pointed out that the reduction in the rating on freight machines could not be offered to the one hundred or more manufacturers who make passenger machines exclusively as justification for advancing their rating.

Chairman Fyfe also tried to show that the carriers' earnings would be about equalized by advancing the passenger machine rating and reducing the truck rating, but Mr. Marvin contended that the much larger volume of passenger machines in normal times disproved this statement and that each type of machine should be rated on its merits. He also produced a summary of all the light-loading articles in the classification pointing to the fact that none of them moved in such volume as automobiles, but that it was only on the automobiles that the consolidated classification showed an increase.

### Wheels, Tanks and Other Parts

Objection was also made to an increase from 24,000 lb. to 30,000 lb. carload minimum on automobile wheels shipped in the East; an increase of one class in the carload rating on gasoline tanks, spring assemblies and jacks in the East; the minimum weight on 50 ft. cars in the West would be increased 2000 lb. which was stated would affect certain types of machines which cannot be double-decked and attain heavy loading. Rules that would require open car shipments to be covered by fireproof tarpaulins and detachable parts boxed and attached to the floor of freight cars, were opposed on the ground that the manufacturers have safer ways of hiding the tools from view that would be better for both shippers and carriers and that all the manufacturers can do is to use tarpaulins that have been fireproofed. The carriers thought that on these points they could come to an agreement with the shippers.

## Fordson Tractor Price Advanced

Regular Prices in Effect, and Dealers and Distributors Make Profits

SALINA, KAN., Aug. 8—The price on Fordson tractors has been advanced. The period of distribution "without profit" is at an end. Everybody now is making some money.

Probably the prices which prevail here may be taken as typical of what the Fordson prices will be everywhere, as in all probability a uniform price will prevail, freights being taken into consideration.

The Hudkins Tractor Co., distributor here for the Fordson in the 50 northern counties of Kansas, is making the following prices:

Retail price at Salina for the tractor ..... \$920.00

Retail price at Salina for the No.

7 Oliver plow ..... 145.00

Retail price at Salina for the Lean harrow, f.o.b. Mansfield.. 146.00

Price of tractor to sub-dealer, f.o.b. Salina ..... 787.50

To this price the dealer is permitted to add a profit of 12½ per cent.

As far as it is possible to ascertain here the price of the tractor to the distributor remains as it was, \$750, f.o.b. Dearborn, Mich.

Nor has any change been made in prices to distributors on the No. 7 Oliver plow nor the Lean harrow.

For the present the distributors and dealers selling the Fordson tractor will confine their equipment sales to the plow and the harrow, but will take on other lines as rapidly as they receive the approval of Henry Ford.

### Government Contractors May Take Over Special Plants on Completion of Work

WASHINGTON, Aug. 13—Hereafter manufacturers who are furnished with special materials at the Government's expense may agree to take over such facilities at a fair value. Manufacturers frequently have to construct additional buildings or provide such machinery in order to fulfill terms of war contracts. Under the terms of the Government contracts now made, title in such improvements vests in the United States. The new clauses in the contracts give the contractors opportunity to take over these new facilities, paying for them at their appraised value at the time of making the offer, either by payment of money direct or by an amortization plan.

If the contractor does not make the Government an offer or if his offer is unacceptable the Government retains the right to remove all facilities provided after the termination of the contract. A reasonable time is given to the Government to remove all facilities, or if the Government prefers to keep the facilities, the contract provides that it may buy

the land upon which they have been erected.

Increased manufacturing facilities created by the War Department exclusive of the new industries serving the Navy and Emergency Fleet Corporation, from April 7, 1917, to July, 1918, cost \$400,000,000. Seventy per cent has been or will be spent in sections of the country other than in the New England or east central states. In fact the investments have been distributed through almost half of the United States.

#### Dealers' Association to Meet War Industries Board on Car Curtailment

WASHINGTON, Aug. 13—The National Automobile Dealers' Association and the War Industries Board will hold a conference regarding curtailment of the passenger car industry on Friday, Aug. 16, at 10 o'clock. This meeting is the result of numerous telegrams from officers and members of the association requesting a hearing before the board in relation to its suggestion that automobile manufacturers convert their factories to 100 per cent war work by Jan. 1, 1919. The meeting will be between the officers of the association and the sub-committee of the War Industries Board, which deals with the automobile industry.

Possible seizure of the stock of materials now on hand in passenger car factories is hinted at by the War Industries Board in its statement, which says the board "will not deprive the manufacturers of stocks of material they have on hand unless the demand of the war situation requires it, in which event the automobile industry will be treated as any other industry would be under like conditions."

The War Industries Board, in its formal statement, announcing the meeting for Friday, also says that it "wishes the automobile dealers and everyone else to understand that the letter to the automobile manufacturers (suggesting a 100 per cent war work program) was prompted only by labor and material conditions that made it imperative if the Government's war program is not to be interfered with."

## Government Traffic Offices

### Established at Detroit and Other Points to Facilitate Movement of War Supplies

DETROIT, Aug. 13—For the purpose of facilitating the movement of materials and supplies for the War Department, the Government has established an office in Detroit and several other points throughout the United States. These offices will be under civilian traffic managers with commissioned officers as assistants where there is need of help. The Detroit office will be in charge of A. J. Dutcher.

In circular No. 2A, superseding and canceling No. 2, the functions of the bureau are explained, in part, as follows:

The duties of those in charge of branch and district offices with respect to the transportation of property are as follows:

A. To represent the Inland Traffic Service in all matters within its jurisdiction, subject to the established rules and regulations.

B. To promptly and effectively respond to all requirements of the War Department pertaining to the transportation of War Department property, inland and coastwise.

C. To respond, with respect to matters within their jurisdiction, to requests from officers and representatives of the United States Railroad Administration and the individual carriers, including water lines.

D. To perform all duties pertaining to the transportation, inland and coastwise, of all property of the War Department moving by express, freight or otherwise, and the routing thereof, beginning with the ordering of cars or other vehicles for use in shipping the property.

E. To exercise special supervision over the shipment of property by express

and to substitute freight service when practicable.

F. To inform themselves with respect to the service available by inland and coastwise waterways and the rates applicable, and to encourage the movement of the maximum amount of property via such routes when safe and practicable and the expense therefor is not in excess of the expense for movement by rail, including cartage and considering land grant deductions. Any departure from the latter rule must be approved by the chief, Inland Traffic Service.

G. To confer with officers and agents of the carrier, to insure the prompt movement to its destination of all property of the War Department being delayed en route; to report to the consignee and to the chief, Inland Traffic Service, through the proper channels, the action taken in all such cases, and for such other purposes as may be necessary.

H. To keep themselves informed at all times with regard to the conditions at important railway centers and junction points, transfer depots, etc.

#### N. Y. to Announce Approved Headlamp Devices Sept. 1.

ALBANY, N. Y., Aug. 10—Secretary of State Francis M. Hugo is not expected to be able to announce the full list of non-glare headlight devices until about Sept. 1. About forty devices are waiting at the Electrical Testing Laboratories, East End Avenue and Eightieth Street, New York, for test. The tests will be in charge of W. P. Little, who will begin the work as soon as testing reflectors are received.

#### Transport Truck Elects Officers

MOUNT PLEASANT, MICH., Aug. 10—At the first directors' meeting of the new Transport Truck Co., held July 27, the following officers were elected: President and director of sales, M. A. Holmes; first vice-president and chairman of board of directors, H. E. Chatterton; vice-president and treasurer, A. E. Gorham; secretary, W. D. Hood.

Estimated average total production per working day of bituminous coal, including coal coked. The average daily requirements established by the Fuel Administration are 2,100,000 for the summer months and 1,970,000 during the winter months (from Oct. 1 to March 31)

## Lower Car and Truck Taxes Agreed On

### Ways and Means Committee Bases New Tax on Horsepower

WASHINGTON, Aug. 9—Lower taxes on automobile and truck users of the nation were agreed upon yesterday by the Ways and Means Committee. The new automobile tax is based on horsepower instead of original cost price. It will raise \$50,000,000 instead of the \$100,000,000 estimated on the earlier tax proposal. The tax agreed upon yesterday applies to users of both passenger cars and trucks and was as follows:

23 hp. or less.....	\$10.00
24 to 30 hp.....	20.00
31 to 40 hp.....	30.00
More than 40 hp.....	50.00

The original tax as proposed, a tax based on the original cost of automobiles and trucks, was withdrawn because of considerable opposition due to the injustice of the tax. Under the original tax planned, owners of cars 5 to 6 years old would have been compelled to pay a higher tax in many instances than owners of cars 1 to 2 years old.

It is expected that there will be some opposition to the new tax proposed, owing to the fact that it will lay a heavy burden on the users of motor trucks, which are at no time considered as other than utilitarian.

### A Million and a Half Women Replace Men In British Industries

WASHINGTON, Aug. 12—The total number of women directly replacing men in industry in Great Britain is reported as 1,442,000 for January, 1918, by the current issue of the monthly labor review of the Department of Labor. In April, 1917, the number of women directly replacing men was estimated at 1,256,000, over three-fourths of whom were in industrial and commercial occupations and in Government employ.

The degree to which women replace men varies widely in different industries. In Government establishments not including controlled establishments they formed 36 per cent of the total employees; in banking and finance 24.6 per cent; in commercial occupations, 16.9 per cent; in engineering firms 7.14 per cent; in all metal trades 6 per cent. These figures refer only to the women directly replacing men. Many others are working but only partially or indirectly replace the men who have been withdrawn.

### Ordnance Department Needs More Men

NEW YORK, Aug. 12—The Government needs still more experts in plants of this district. C. V. Meserole, room 306, 45 John Street, special representative in New York of the Ordnance Department, has issued a call for produc-

tion men experienced in machine shop and erection, ammunition, explosives, loading, small arm and gauge work. These are among the best paying positions in the Ordnance Department, and require men capable of visiting shops, conferring with managers and speeding up the work whenever opportunity presents itself. Selling experience, ability to direct large forces of men and personality are important qualifications.

### Farm Tractors at Wisconsin State Fair

MILWAUKEE, WIS., Aug. 12—Twenty-six manufacturers of farm tractors have made reservations of space for display and demonstration purposes at the annual Wisconsin State Fair, to be held at West Allis, Milwaukee County, during the week of Sept. 9-14. The tractor show is expected to be one of the largest yet held in connection with a state fair. The department is operated directly by the management of the fair, while the motor car and truck exposition will again be under the immediate direction of the Milwaukee Automobile Dealers, Inc., which has conducted the motor show on the fair grounds for four years past. The tractor show will be under a tent, while the motor show will occupy a mammoth fireproof building erected for this purpose several years ago. O. E. Remy is general secretary of the fair.

### Ford Modifies Wages Plan

DETROIT, Aug. 12—The Ford Motor Co. has modified its wage payment scheme with the result that employees who meet all requirements are entitled to \$5 a day on completion of 30 days' work at the plant. The former rule provided that an employee had to be with the company 6 months before being eligible for the \$5 rate. The minimum wage scale has been raised from 43 cents to 50 cents an hour.

### Lee Rubber Shows Substantial Earnings

CONSHOHOCKEN, PA., Aug. 9—The Lee Tire & Rubber Co. has shown net earnings before taxes substantially in excess of \$300,000 on a gross business of over \$3,000,000 during the first six months of the year.

### Zwebell Bros. Co. Incorporates

MILWAUKEE, WIS., Aug. 12—Zwebell Bros. Co., Milwaukee, has been incorporated with a capital stock of \$25,000 to engage in the manufacture of a mold for retreading tires and also to conduct a general wholesale and jobbing business in tire repair material and supplies. The principal stockholders are Arthur B., Herbert A. and Albert R. Zwebell, who have been engaged in the motor car sales and repairshop business for many years and recently developed an improved method of dry-cure retreading. Temporary headquarters have been established at 188 Eighth Street, Milwaukee.

## No Anthracite for Newark Dealers

### Fuel Administrator Refuses Standard Sizes to Automobile Men

WASHINGTON, Aug. 12—The refusal of the Newark, N. J., Fuel Administrator to give standard sizes of anthracite coal to automobile manufacturers, dealers and garages, as reported this past week, is not entirely in accord with the national anthracite distribution plan of the United States Fuel Administration. Anthracite coal is being conserved for domestic purposes almost entirely. It is only allotted for other use in exceptional instances, for example where war plants must have it. The general industry of the country is asked to use only bituminous coal and fine screenings of anthracite coal, known as buckwheat and rice sizes. Garages, however, will be entitled to anthracite coal if they require it. They are classed by the Fuel Administration as public utilities. Automobile dealers are classified as retail establishments, the same as any other retail store, and come under the head of domestic consumers, and are also entitled to anthracite coal. Automobile and truck manufacturing plants will get bituminous coal and buckwheat and rice anthracite unless they are engaged in war work, and anthracite coal is essential to the operation of the factory.

### War Conservation Investigation of Wisconsin Dealers

MILWAUKEE, WIS., Aug. 12—Alfred Reeke, head of the Alfred Reeke Co., Milwaukee distributor of the Nash, is making a tour of investigation as state director of war conservation of the National Automobile Dealers' Association to determine if Wisconsin dealers and garagemen are complying with the regulations and rules relative to the business. Violations reported so far have been few and far between and Mr. Reeke believes he will be able to return with a 100 per cent report. Garagemen in all of the smaller communities have adopted the rules and arranged for an emergency service station for Sunday, holiday and night work under the usual restrictions.

### Wisconsin Power Farming Association Formed

MILWAUKEE, WIS., Aug. 12—To promote the "Better Farming" movement and bring the tractor to the attention of every farmer in Wisconsin, representatives of all of the larger tractor manufacturers in this state have organized the Wisconsin Power Farming Association. The first general meeting was held in Milwaukee on Aug. 6. Officers have been elected as follows: President, F. W. Kamm, sales manager tractor department Allis-Chalmers Mfg. Co., Milwaukee; vice-president, Fred. F.

Hatcher, manager Milwaukee branch John Deere Plow Co.; secretary, E. A. Brauh, sales manager Trenam Tractor Co., Stevens Point, Wis.; treasurer, W. F. Loomis, manager Milwaukee branch Oliver Chilled Plow Co. F. W. Geddes, general manager of the Cleveland Tractor Sales Co., Milwaukee, is an additional director.

#### Hurricane Sweeps Gerstner Aviation Field

WASHINGTON, Aug. 10—Two men died at Gerstner Field, La., as a result of the hurricane which swept that vicinity on Aug. 6. Damage done to Government property is estimated in the amount of \$991,000.

All the planes except five scouts and about 38 training planes were completely demolished. These will be quickly repaired and ready by the time the hangars are reconstructed. The lighting system at the field will need entire overhauling as a result of the storm. Clearing up of debris and the salvaging of engines and machines are now going on.

#### Wind Velocity of 96 M.P.H.

The wind velocity at the height of the storm was 96 miles an hour. Twelve hangars were totally wrecked; ten partially; only two were left in any condition to afford shelter to property now being salvaged. The quarters of the officers and men held together and defied the storm. Eight men were injured, but not seriously. All the wires are down in the vicinity of Lake Charles and Lake Charles village is badly damaged. Practically all the houses within a radius of 30 miles have been laid flat. The training camp at Gerstner Field also reports that it furnished a guard of soldiers, who assisted in the relief work at the village of Lake Charles.

#### French Ordnance Experts Arrive

WASHINGTON, Aug. 12—A mission of French ordnance engineers and experts has arrived in the United States. It is to be headed by Lt. Col. J. Martinon, who was at one time in charge of production of a large French ordnance factory. The purpose of the trip is to make possible better co-operation between the industrial resources of the two countries in the output of ordnance materials. The members of the mission will visit factories in this country, and it is expected that a mission of American ordnance experts engaged on a similar mission will visit France at a later time.

#### Tractors at Columbus State Fair

COLUMBUS, Aug. 8—It is expected that at least 25 tractor manufacturers will exhibit at the Ohio State Fair, which will be held during the last week of this month. Because of the number of tractor exhibitors the fair management has set aside considerable additional space for their accommodation.

## National Trademark on Goods

### Divergent Views on Proposal Made by Department of Commerce

WASHINGTON, Aug. 10—Both approval and opposition have been voiced by American industry to the proposal of the Department of Commerce for a national trademark to be affixed to American merchandise.

Objections to the national trademark are based on the fact that less important domestic competitors using the same trademark will be benefited in export trade so that they can compete with the larger companies who have spent years of earnest effort and considerable funds to establish their reputations. Another objection is that the trademark will apply to all sorts of products, good, bad and indifferent.

The Department of Commerce replies to this opposition by pointing out the benefits derived from a national trademark. At the present time foreign competitors can use the legend "made in U. S. A." and there is no method for preventing that use. Consequently, to-day foreign manufacturers are competing with American manufacturers. A national trademark will create good will in foreign markets for our products, increasing our foreign trade and popularity.

#### Bond to Forestall Dishonest Practice

The trademark bill now pending provides a forfeiture of a bond of \$5,000 as well as revocation of the trademark license, which will prevent the sale of dishonest goods abroad and thus forestall boycotts of American goods which have resulted from inferior exports, thus not only disproving that good, bad and indifferent goods can be exported with a national trademark, but substantiating the claim that boycotts will be forestalled.

The fact that the mark will be used by competitors to the disadvantage of the established concern is offset by the delay and expense attached to building up a big foreign business. A domestic competitor who has now export business will begin with a certain amount of good will as a result of the national trademark, but he must still develop a merchandising organization to sell his goods abroad, must overcome the problems of transportation, credits, agencies, special styles and models, correspondence in foreign languages, duties, packing, etc., and when he has accomplished all these if his goods find a market abroad it will not be at the expense of the established manufacturer unless the product is more meritorious, in which event opposition to the trademark is a purely selfish one which will not be considered by the Department of Commerce.

The bill which has been presented to Congress by the Department of Commerce authorizes the Secretary of Commerce to secure a design to be adopted and promulgated as an emblem in the nature of a trademark suitable for affixing in any manner to merchandise produced or manufactured in the United States which is to be known as the national trademark. It is to be registered in the Patent Office in the name of the United States of America, without limitation of time and covering every description and class of

goods recognized under the Trademark Act active in this country.

The trademark is to be protected in foreign countries. Any manufacturers, producers or merchants in the United States can secure the license by making application and payment of a reasonable fee. Bond is to be executed not to exceed \$5,000 that the licensee will faithfully comply with all the rules and regulations.

Provision is made in the bill to protect its rights, to prevent imitation of the trademark and to terminate the license in event of infractions of the rules.

#### To Finance Tractor Purchases

BOSTON, Aug. 10—With a capitalization of \$1,000,000, nearly all of which has been paid in, the Commercial Finance Corp. of Boston is about ready to start operations financing the sale of motor trucks and tractors throughout New England at first and other parts of the country later. While the motor dealers are not behind it as a body a number of them have invested in the company. On the Board of Directors are F. A. Hinchcliffe of the Jordan agency, who is treasurer of the Boston Automobile Dealers' Association; Edward C. Becker of the Becker-Stutz Co., and John L. Judd, who sells the Smith Form-A-Truck, Gramm Bernstein and Columbia trucks and the Allen and Auburn cars. It is planned to put other motor dealers on the board later. Some of the prominent financiers in Boston are identified with the company. With the tractor field practically dead in New England due to motor dealers not paying any attention to this type of vehicles, the men behind the new company will try to interest farmers in speeding up through the use of such vehicles, and from tractors to trucks to carry the product to market will be a short step. It will finance the buying of passenger cars, too, and its charter allows it to deal in other things, but at first the truck and tractor field will engage the attention of the officers.

#### State Good Roads Meet to Open Sept. 3

DETROIT, Aug. 12—The tenth annual convention of the Michigan State Good Roads Association will be held here from Sept. 3 to 6 at the fair grounds. More than 100 manufacturers of road machinery have agreed to exhibit and men prominent in good roads movements in this and other states will give addresses. The program has been arranged as follows: Sept. 3, State Highway Commissioners' Day; Wednesday, Manufacturers and Materials Day; Thursday, Michigan State Good Roads Association Day; Friday, Demonstration.

#### 50,000 Unskilled Workers Needed for War Orders

WASHINGTON, Aug. 12—War employers making reports since Aug. 1 of labor shortage show a total need for 50,000 unskilled workers. In some instances operation is virtually at a standstill.

### Slater Joins the Williams Foundry & Machine Co.

AKRON, Aug. 12—William J. Slater has resigned as pneumatic tire sales manager of the Firestone Tire & Rubber Co. to become the general sales manager of the Williams Foundry & Machine Co.

E. Van Hanbach has resigned as chief engineer of the Whittier Co., Chicago, to come east and take up the duties of sales manager and engineer with the Schaaps Automobile Co., Brooklyn, N. Y.

W. S. Johnston, president of W. S. Johnston, Inc., Trenton, N. J., distributors of Marmon, Chalmers and Maxwell cars and Selden trucks, has joined the engineering department of the Naval aircraft factory at Philadelphia.

L. Clyde Smith has been appointed assistant general manager and treasurer of the Detroit Weatherproof Body Co., Pontiac, Mich. He recently disposed of his interests in the Detroit Welding & Mfg., Detroit Electric Welder and Burns Starter companies.

### Entries for State Fair Coming In

DETROIT, Aug. 13—Sixteen truck and passenger car manufacturers have signified their intentions of entering exhibits in the Michigan State Fair this year, which will be held Aug. 30 to Sept. 8. The names follow:

Dodge Brothers	Denby Motor Truck
Ford Motor Co.	Co.
Olds Motor Works	Detroit Universal
Maxwell Motor Sales	Truck Unit
Corp.	Republic Motor Truck
McCord Mfg. Co.	Co.
Smith Form-a-Truck	Signal Motor Truck
Acme Motor Truck	Co.
Co.	Federal Motor Truck
Acason Motor Truck	Co.
Co.	Frank Foster (Sterling Motor Truck Co.)
Nash Motors Co.	

Seven accessories have also signed as exhibitors, as follows:

L. Lawrence Welding Co.	Irwin Tire & Repair
Specialty Sales Co.	Co.
Lyknu Polish Co.	Security Auto Theft
Coffield Tire Co.	Signal Co.
	Presto Cloth Co.

### May Adopt Treasury Plan of War Profit Taxation

WASHINGTON, Aug. 13—It now appears likely that the Treasury plan of taxation will be adopted in preference to the scheme suggested by Congressman Claude Kitchin. The Treasury tax, which aims to collect at least \$5,000,000,000, demands an 80 per cent tax on actual war profits, to be determined by ascertaining the average annual profits for 3 years previous to our entrance in the war. The average annual profits prior to the war will be regarded as the basis of profits, and all profits in excess of this will be considered war profits, and subject to 80 per cent tax. An alternative tax is also included, the same as the present excess profit tax, from 20 to 30 per cent, and taxpayers will be obliged to pay the tax which brings the higher return to the Government.

## Men of the Industry

### Changes in Personnel and Position

E. P. Dillon, manager of power division, New York office of the Westinghouse Electric & Mfg. Co., has resigned to become general manager of the Research Corporation of New York. Mr. Dillon came to the Westinghouse company in 1909, having been previously connected with various mining companies.

C. L. Alexander has resigned as sales office manager of Dodge Brothers, Detroit, to assume new duties Aug. 15 as expert in business administration in the Detroit district of the ordnance department.

### Senate Aircraft Report Expected Soon

WASHINGTON, Aug. 10—Secretary of War Newton D. Baker was questioned yesterday for more than an hour by the Senate Military Affairs sub-committee on aircraft. None of the details were made public, but it is reported that both the Senators and the Secretary reached a point of irritation. The Senators charged the Secretary failed to properly reply to questions which the Secretary in turn did not apparently see fit to answer.

The committee has finished its hearings and the report, it is said, will be made public some time early next week. It is understood that some instances of "graft" were found and brought to the attention of the Department of Justice. The committee report will deal only with the causes of the so-called "fall-down" of the air program.

### Hodgkins Leaves Studebaker

SOUTH BEND, Aug. 12—R. T. Hodgkins, for the past 4 years general sales manager for the Studebaker Corp., South Bend, has been appointed general sales manager of the Cleveland Tractor Co., Cleveland. Prior to his connection with the Studebaker he was head of the sales organization of the hoisting machinery department of the Yale & Towne Mfg. Co.

W. O. Kennington, European consulting engineer of the Remy Electric Co. is now in this country on a special mission for the British government.

Paul J. Barnard, sales manager of the Walker Mfg. Co., Racine, Wis., manufacturer of jacks and other accessories, has resigned to accept a commission as captain in the Quartermaster Department in the U. S. Army.

### Decrease in Production of Bituminous Coal

WASHINGTON, Aug. 13—The bituminous coal mines of this country produced 12,422,000 tons of coal during the week ended Aug. 3. This was an increase of 1,563,000 tons, or 14.3 per cent, over the production of the corresponding week of 1917. It was a decrease of 3 per cent, or 396,000 tons, over the output of the preceding week. Car shortage was the chief cause for the decline.

Anthracite shipments during the week ended Aug. 3 amounted to 39,632 carloads, a decrease of 1310 carloads, or 3.2 per cent, as compared with the preceding week.

During the week of July 27 the mines produced 82.6 per cent of their full time output. The losses were due to the following causes: Car shortage, 7.4 per cent; labor shortage, including strikes, 4.2 per cent; mine disability, 4.1 per cent; no market, 0.2 per cent; all other causes, 1.5 per cent.

One of a number of automobile searchlights used on the Italian front. Current is furnished by an engine-driven generator, and a portable searchlight may be operated from a distance by means of the electric cable shown on the reel at the rear

**Chevrolet Building New Factory**

YORK, Aug. 10—The Chevrolet Co. will erect an addition to its 2nd Point plant at Tarrytown to space for building a large number of kitchen trailers for the Government. The new building will be three stories and basement, built of reinforced concrete. The cost is to be \$175,000 and the contract calls for its completion in

**Electric Auto Co. to Make Gun Sight Parts**

INDO, Aug. 12—The Electric Auto Co. has been awarded additional contracts by the Ordnance Department for parts for large guns. One contract calls for panoramic sight extensions and the other for sight levels. They will be used on the French 15 mm. gun. The company is also making machine gun sights.

**Coal for Detroit Workers Assured**

DETROIT, Aug. 14—A committee of Detroit coal consumers conferred here with the officials of the United States Fuel Administration to secure coal supply for Detroit, and particularly the domestic consumption supply. It was stated that the supply of coal for Detroit was excellent, and that additional assurances were asked for to supply of coal for domestic consumption in order that the labor element in that city will have no trouble in getting a proper supply of workers. The committee was assured of a satisfactory supply of domestic sizes of coal.

**New Truck from St. Louis**

ST. LOUIS, Aug. 12—The Universal Truck & Traction Engine Co. of St. Louis has completed a demonstration of a new truck designed by Daniel T. Timberlake. It has a short turning radius,

## Current News of Factories

*Notes of New Plants—Old  
Ones Enlarged*

offers optional location of motor and has steering aid from the motor. A factory is planned at St. James, Mo. Edward Bray, of St. James, is president of the company. The company has offices in the Syndicate Trust Building, this city.

**Building New Winther Factory**

KENOSHA, WIS., Aug. 12—Work has begun on the construction of the new plant of the Winther Motor Truck Co. at Kenosha, Wis. It will be of brick and steel, 150 x 350 ft., and with complete equipment will represent an investment of approximately \$125,000. The company is now operating in leased quarters at Winthrop Harbor, Ill., just south of Kenosha.

**Milwaukee Steel Foundry Co. Extends Factory**

MILWAUKEE, WIS., Aug. 12—The Milwaukee Steel Foundry Co., 101-121 South Water Street, Milwaukee, is making plant extensions and improvements costing \$125,000, which will provide a complete electric steel casting shop to supplement the present converter steel plant having a monthly output of 400 tons. A 3-ton Heroult furnace will be installed. A new pattern shop and storage building, 40 x 80 ft., five stories high, and a new office building, 40 x 50 ft., two stories, are also to be constructed. The electric steel foundry unit will be 100 x 125 ft. Burton C. Wait is president and general manager.

**Pierce-Arrow to Build Hispano-Suiza Airplane Engines**

BUFFALO, Aug. 10—The Pierce-Arrow Motor Car Co. has made arrangements with the Wright-Martin Aircraft Corp. whereby it will manufacture Hispano-Suiza airplane engines. These will be produced at the rate of 30 per day by Jan. 1, and it is expected that the rate of production will be increased to 50 per day by April next.

**Oakland to Build Trucks Almost Exclusively**

PONTIAC, MICH., Aug. 8—The Oakland Motor Car Co. will devote most of its capacity to building trucks for the duration of the war. It is expected that production will start in about 90 days. The truck will be a 1-ton model which will embody several new features.

**Buick Prices to be Increased**

DETROIT, Aug. 14—The Buick Motor Co. will increase prices on its 1919 models, which are expected to be ready on or about Sept. 1, as follows:

Model	Old Price	New Price
H-44; H-45.....	\$1,245	\$1,495
H-46 .....	1,695	1,985
H-47 .....	1,845	2,095
H-49 .....	1,495	1,785
H-50 .....	2,175	2,485

**Ben Hur Plant Acquired by Government**

CLEVELAND, Aug. 10—The plant of the defunct Ben Hur Co. at Willoughby has been leased by the government for the duration of the war, and the factory is already being placed in readiness for the work.

**New Buildings for Overland Completed**

TOLEDO, Aug. 13—The additions erected for the Willys-Overland, Inc., to be used for war work to manufacture shells and gun carriages, have been completed and production will begin early in September.

**Shop Committees to Spread Education**

WASHINGTON, Aug. 14—Employers engaged in Government work have been asked to have shop committees selected by employers and employees, created in all the plants for the purpose of spreading education to increase production. This work is under the Industries Plants Division of the Information and Education Service of the Department of Labor. The creation of these committees is the first step in a nationwide organization of employers and employees for increased production in all lines of war work.

**Automobile Makers Pay \$23,981,000 Revenue**

WASHINGTON, Aug. 10—Automobile and motorcycle manufacturers and dealers paid into the Treasury Department \$23,981,000 under the war revenue bill for the year ended June 30, 1918, according to a statement issued by the Treasury Department.

A British motorcycle machine gun detachment operating in Italy

## President Approves Copper Price

Operators Must Not Reduce  
Wages; Must Not Sell  
Above Maximum

WASHINGTON, Aug. 10—The President has approved the maximum price of 26 cents per pound for copper, which was announced in last week's issue of **AUTOMOTIVE INDUSTRIES**.

The conditions are: First, that the producers of copper will not reduce the wages now being paid; second, that they will sell to the United States Government, to the public of the United States, and to the Allied Governments at not above the maximum price; third, that they will take the necessary measures, under the direction of the War Industries Board, in the distribution of copper to prevent it from falling into the hands of speculators, who might increase the price to the public, and, fourth, that they will pledge themselves to exert every effort necessary to keep up the production of copper so as to insure an adequate supply so long as the war lasts.

The price takes effect Aug. 15, 1918, and is subject to revision after Aug. 1, 1918, f.o.b. cars or lighters at eastern refineries; f.o.b. cars or lighters at Pacific Coast refineries for Pacific Coast destinations, and f.o.b. cars or lighters New York if shipped to Eastern or interior destinations from Pacific Coast refineries and from refineries in the in-

terior of the United States. All shipments made after Nov. 1, 1918, are subject to any change in price made by the Price Fixing Committee to take effect after that date. This maximum price is subject to the additional charges on copper shapes approved by the Price Fixing Committee on June 5, 1918.

### Field Mfg. Co. Making Government Truck Bodies

OWOSSO, MICH., Aug. 12—The Field Mfg. Co. is turning out daily from ten to twelve motor truck bodies, which, when fully equipped, will be mounted machine shops for the repairing of airplanes in France. The company has an order for 450 of these bodies, of which 250 have already been shipped. The bodies are being made under government inspection, a government representative being stationed at the plant at all times. The Government's purpose in having the machine shops mounted on trucks is that the shop may go to a disabled airplane instead of it being necessary to bring the airplane to the shop.

### Ford Has Many Electrical Repairs

DETROIT, Aug. 12—An idea of the magnitude of the plant of the Ford Motor Co. can be gathered from the following, which gives only a month's tabulation of the electrical equipment that was required for either new or repair work from April 16 to May 16: Tungsten lamps, 1682; carbon lamps, 2739; mercury vapor tubes, 102; shifters, 36; lamp cord, 1619 ft.

## Nordyke & Marmon Co. Establishes Car Line Service for Its Employees

A special street car service for its 4000 employees is being operated by the Nordyke & Marmon Co., Indianapolis. Ten street cars run for two hours both morning and evening between the factory and the center of the city. Company employees operate the cars

## Few Amputations Among Wounded

British Figures Show Causes of  
Disablement and Their Effect  
on Vocational Re-education

WASHINGTON, Aug. 12—In the recent issue of the Vocational Sun which is the official publication of the Federal Board for Vocational Education are given the results of an analysis of the causes of disability found among British soldiers who have been forced to leave the present war because of wounds or illness incurred in it.

As the re-education of disabled soldiers will shortly be undertaken in this country on a systematic basis, the statistics given below should prove not only of interest but highly instructive. They are calculated from a total of 3,000 pension records which had accumulated up to the end of April of this year.

### Small Percentage Need Amputation

In view of what we have seen here in the way of photographs of maimed and legless soldiers, learning that in the British army, in various occupations, it is rather surprising to note that only a total of 4.9 per cent of injuries sustained by these more than 300,000 disabled men necessitated amputation of an arm or leg.

The percentages of the different degrees of disablement among these retired British soldiers were as follows:

Wounds, etc., to legs not necessitating amputation	.....
Chest complaints and tuberculosis	.....
Heart disease	.....
Wounds, etc., to arms not necessitating amputation	.....
Rheumatism	.....
Nervous diseases, shell shock, etc.	.....
Wounds, etc., to hands not necessitating amputation	.....
Wounds, etc., to head	.....
Eyesight cases	.....
Wounds and injuries to legs necessitating amputation	.....
Deafness	.....
Wounds and injuries to arms necessitating amputation	.....
Frostbite, including cases of amputation of feet or legs	.....
Miscellaneous wounds and injuries	.....
Miscellaneous diseases	.....

### Bombing the German Base at Bruges

WASHINGTON, Aug. 10—Bruges, one of the most important German naval bases in Belgium, has been attacked so often by the British, that it is now one of the best defended points in the world. A night bombing on the Western Front, The report, made by a member of the Royal Air Forces, describes in detail the work and sensation of night bombing.

The pilot and observer of a night bombing machine proceeding over Bruges have no difficulty in finding their way. Searchlights moving restlessly over the town make a haze of light which can be seen 30 miles off. Further air "scare" are so numerous each that the city is a constant display of red flashing bombs and brilliant emerald colored balls of fire mounting into the sky and ending at some usually inary fall.

ing near the city the observer through a little door in the nose machine, examines his bombing and adjusts the bomb-dropping. As he kneels on the little wooden, 10,000 ft. or more above the ground is usually so absorbed in his atching the ground and seeking objective that his surroundings seem very normal and he is entirely at

ratches for the black line on the ground, which serves as a guide, and the pilot with a wave of the hand. The approach to the town is forecast by the presence of shipping docks; far to the left is the dark line of the Belgian coast and the guarding searchlights over Ostend and Zeebrugge are instantly.

The observer, states the report, waves his hand, the roar of the engine dies in the machine dives for its target. The bomb handle is unstrapped. The observer leans far over the front, following the course of the little metal bar of sight. He quickly guides the pilot to the left and the bar sweeps and crosses the section of the ob-

#### Deeds of Gunners Watching

The observer then checks the pilot and his bomb-lever in readiness. Hundreds of Germans stand waiting at their machine-guns, but the observer has time for nothing but the passage of the sight bar over the objective. Suddenly the sight registers the range. He pulls the lever forward slowly, pulls the trigger and pushes it forward again and

the rear of the plane comes under a shower of 14 dropping bombs. The observer turns and the machine sweeps away from the shower of shells, searchlights and explosions that the observer will bring; meanwhile the observer keeps his eye on the objective, for the red spurt of flame that the bomb strikes.

Sheets of flame sweep forward. Simultaneously come hundreds of green balls streaming from the machine while like a handful of ribbons searchlights are thrown up into the sky. The airmen fly home content with their work, leaving the searchlights vainly searching every quarter of the heavens—

#### Ford Resumes Operations

DETROIT, Aug. 12—After a complete shutdown of more than 5 weeks, the Ford Motor Co. factory of the Ford Motor Co.

City, opposite Detroit, has resumed operations to-day, but with less than 50 per cent reduction of the work-force. Only 100 cars will be produced. Previous to the shutdown the normal output of the company averaged from 225 to 250 cars a day. While the company announced it was compelled to close down because of a shortage of labor, numbers of the employees who signed petitions, demanding a wage of \$5 a day, charged they were misled and locked out.

## Madison Dealers Help Farmers

### Employees Are Released to Work on Farms in Vicinity of City

MADISON, WIS., Aug. 10—Dealers and garagemen of Madison, Wis., state capital of Wisconsin, have gone perhaps farther in war conservation work than those of many other cities by releasing their employees, who are physically fit for such work, to work on the farms in the immediate vicinity of Madison during the rush of the harvesting season. The men are being released for two or three days at a time, depending upon the urgency of the calls for farm help. They have agreed to accept whatever wage is paid by the farmer for their services.

The movement resulted from a number of conferences held by the dealers' section of the Madison Association of Commerce, comprising all the dealers and garage owners of Madison. It was decided to enter into an arrangement with the United States Employment Service, through the Madison office, whereby calls for men be made to the employers and they select members of their staffs to respond. The dealers' section includes oil and tire dealers and, in fact, all interests allied with the automotive industry. The action was given wide publicity through the medium of a large display advertisement in the Madison newspapers, in connection with the announcement of the adoption of the war conservation program of the National Automobile Dealers' Association, curtailing hours of service, eliminating free service, enforcing a strictly cash basis and other reforms.

Louis F. Schoelkopf, president of the Madison Association of Commerce, and one of the pioneer dealers and garagemen of Madison, is given credit for the origination of the idea of sending mechanics to the harvest fields. A survey of the employees of garages and repair-shops showed that a great many of the men have had farm experience and are competent to assist threshing gangs and shocking crews. Thus they are able to command practically the same wages as skilled farm laborers. The farmers have been quick to avail themselves of the help thus provided and glad to pay top-notch wages for this class of work. The present month is the most active harvesting period in southern Wisconsin, and more calls are being received than can be filled with the number of men available.

#### Munitions Plant Opens School for Women

JACKSON, MICH., Aug. 12—The Jackson Munitions Corp. has opened a school of instruction for women munition workers, and from now on classes will be held each week day, at which officials

of the company and heads of departments will give instructive lectures relative to the work. This school is for the purpose of recruiting a large number of women who will be needed when the plant is running at full capacity. The plan is to hire inexperienced women, the only qualification necessary being that they be healthy, strong and American. The school will give the applicant a preliminary knowledge of the general nature of the factory's business. At present a force of 150 women is employed at this factory, but this will be very greatly increased soon.

#### Changes in War Supply Contracts

WASHINGTON, Aug. 12—Changes in war supplies' contracts which have just been approved by the superior board of review of the general staff of the War Department provide that hereafter manufacturers who are furnished with special equipment at the expense of the Government may agree to take over such facilities at a fair value in diminution of the profit which they otherwise would make.

The increased manufacturing facilities that have been created by the War Department, exclusive of the new industries serving the army and the Emergency Fleet Corporation from April, 1917, to July, 1918, cost approximately \$400,000,000. These investments have been distributed through almost half of the states. Seventy per cent has been or will be spent in sections of the country other than in the New England or east-central states. The new clauses in the contracts give the contractors an opportunity to take over these new facilities. If the contractor wishes to take title to the facilities he may make written offer to the Government.

#### Goodrich Earnings Almost Double

AKRON, OHIO, Aug. 12—Net profits for the first 6 months of 1918 of the B. F. Goodrich Co., after deduction of maintenance charges, depreciation and doubtful accounts, and after all excess profits and income taxes are provided for, were \$7,150,000. This is almost equal to the profits of the company for the entire year of 1917, which amounted to \$10,544,677. The increase of profit, it was stated, was not entirely due to the increase in war work done by the company, but rather to the large increase in the whole volume of business.

At the recent quarterly meeting of the directors a 1 per cent dividend was declared on preferred stock, payable on Oct. 1 to stockholders of record Sept. 20. A 1 per cent dividend was declared on the common stock, payable on Nov. 15 to stockholders of record Nov. 5.

#### Gear Association to Meet

PHILADELPHIA, Aug. 12—The semi-annual meeting of the American Gear Manufacturers' Association will be held at the Onondaga Hotel, Syracuse, N. Y., Sept. 19, 20 and 21. The program of the meeting will be announced later.

# Industrial Review of the Week

## A Summary of Major Developments in Other Fields

### Farm Machinery Makers Get Reduction on Steel

The fact that makers of agricultural machinery have secured a reduction of \$5 a ton on steel bar shipments in the second half of the year is widely commented on in the steel trade. A concession to this interest on its bar purchases has been no uncommon thing for years. Government price fixing promised to be the end of it. But there was pressure at Washington to prevent any advance in implements to the farmer. The implement manufacturers finally agreed to make no advance if the Government would get them a \$5 reduction on bars. The steel men were appealed to and the reduction was granted.

It remains to be seen how far complications in other bar-consuming trades will result from 2.65c. bars for agricultural purposes. But no other industry heretofore has been able to secure the preference given to implement makers and the odds are even greater now with the Government thrown into the agricultural scale.

High heat and humidity cut down pig iron and steel outputs last week, estimates for the Pittsburgh district running from 10 to 15 per cent, while losses at some eastern Pennsylvania plants were considerably higher.

A factor to be counted on as the American army in France grows is the spirit of the steel workers, particularly in mills supplying the chief essentials, as plates, shell steel and latterly rails. There are some signs of the same effort to get output that has been seen at shipyards, but they might be more general.

The estimated July production of steel ingots, based on the compilations of the American Iron and Steel Institute, is 3,531,600 gross tons. The daily rate fell off about 2.9 per cent from that of June, and while the estimated annual production rate on the July figures (counting 26 days) is only 41,984,000 tons, the rate on the actual output of the last five months, or since the winter and railroad handicaps of January and February, is 42,496,000 tons.

A meeting of the special committee of steel manufacturers with the director of steel supply will be held at Washington next week. The decisions to be made, having to do with the recent more pressing demands from abroad, are regarded as among the most important in the present effort of the War Industries Board to meet the situation.

The action of the War Industries Board in denying steel for passenger automobiles is in line with what has been plainly indicated for months as to the narrowing of the channels of steel uses. Some mills, as in sheet and wire lines, are tending to a steady 60 per cent operation.

In the attempt to increase pig iron and steel output, the new by-product coking capacity is strongly counted on. Of the proposal for Government-aided new construction in iron and steel, the main tangible development is in connection with new steel capacity in the Birmingham district.—*Iron Age*.

### Manufacturers Look for Only 75 Per Cent Cut

(Continued from page 290)

per cent basis. This, of course, they cannot guarantee to do, either for us or for any other so-called non-war industry.

"The board feels that the curtailment will have to be greater than 50 per cent, but at this last meeting the board expressed the wish and desire for the automobile industry to continue in business; that they realized the importance of this industry to the country in its regular business of making passenger cars, and its particular importance to the Government at this time in carrying out its war program.

"The suggestion that the industry go to war work up to 100 per cent is, I believe, what the War Industries Board would consider an ideal situation, from their standpoint, and I think this statement is made more as a warning to our companies to take on war work. The War Industries Board feels, of course, that any company that is engaged in non-war work will have its interests best served if it has 100 per cent war work, but the board never has in any conference expressed a desire for a 100 per cent curtailment of passenger cars. But it feels that the curtailment will have to be greater than 50 per cent. The War Industries Board has never discussed anything more drastic than a 75 per cent curtailment.

"We have been assured again by the War Industries Board that if steel and other materials are available after the war program is taken care of, our industry will get its share, and the board has promised that it will not under any circumstances make any definite commitments to our industry or to any other so-called non-war industry.

"We were somewhat handicapped in our discussion at this last meeting because the inventories were not all in and the board felt that it could not deal properly with the situation until these figures were available. However, after these figures are completed, we are to have another meeting with them, when it will be determined what steel and other materials can be released to the passenger car manufacturers, and on what basis.

"I have written to President Clifton stating it may be advisable to hold another membership meeting after the inventories are completed, and we have

### Lake Iron Ore Movement Breaks All Records

WASHINGTON, Aug. 14—A record breaking movement of iron ore by the Great Lakes fleet is officially reported to the Shipping Board. Notwithstanding the transfer from the Great Lakes of a considerable number of seagoing vessels to transatlantic service, more ore is being moved by the lake carriers than ever before in the history of the trade. The figures for July broke all monthly records. In that month a total of 10,659,203 tons of ore was brought from the Lake Superior mine.

These results have been achieved by speeding up operations of the lake fleet under the direction of the Shipping Board. Many days have been cut from time in port, thus contributing in effect an increase of tonnage. In accordance with instructions from the Shipping Board, the carriers, whenever possible, are loading to the waterline.

To the Shipping Board, the chief significance of the record-breaking movement of ore is the assurance it gives of an increase in the output of steel. An indicated deficiency of this material for war requirements has been causing the board considerable concern.

### Plenty of Oil Tank Cars Available

WASHINGTON, Aug. 13—If oil production during the coming months falls below the standard set by army and navy officials no blame can attach to the Railroad Administration, according to Director-General McAdoo. Sufficient tank cars have been provided in all fields, he said, to carry the production to distributing points without delay.

Several months ago, Mr. McAdoo pointed out, oil producers were complaining because they could not obtain tank cars to carry their products. The tank cars, he said, were placed under the control of the Government and were distributed so as to provide tonnage in all oil fields.

### Marine Corps Places Contracts

WASHINGTON, Aug. 12—The Quartermaster of the U. S. Marine Corps has placed the following contracts:

The Trailmobile Co., Washington, D. C., 12 trailmobiles.

H. W. Johns-Manville Co., Philadelphia, Pa., fuse renewals.

had a chance to discuss the matter again with the War Industries Board. In order to expedite matters, I would suggest that if you have not sent in your inventory of materials, that you do so at once, as failure to do so is only holding up further negotiations with the board for the materials which we need."

## Aircraft Production Purchases

WASHINGTON, Aug. 7—Following is a list of purchases contracted for by the Bureau of Aircraft Production:

July 11, 1918.

United States Gage Co., 67 Wall Street, New York City, 475 gages.  
Bower Roller Bearing Co., Detroit, Mich., 2000 outside wheel bearings, 2000 inside wheel bearings.  
Curtiss Aeroplane & Motor Corp., Buffalo, N. Y., spares for Curtiss V-2-3 engines, bearings exhaust and intake valves, pistons, crankshafts, etc.  
Western Electric Co., 463 West Street, New York, N. Y., 10 wavemeters.  
United State Gage Co., 67 Wall Street, New York City, services in repairing approximately 2000 gages for oxygen apparatus.

July 13, 1918.

Hartzell Walnut Propeller Co., Piqua, O., 2500 generator propellers.  
John A. Roebling Sons Co., Trenton, N. J., 2,000,000 ft. aircraft wire.  
Burd High-Compression Ring Co., Rockford, Ill., 20,000 compression piston rings.  
American Propeller & Manufacturing Co., Baltimore, 2000 constant speed regulating fans.

July 15, 1918.

Klaxon Co., Newark, N. J., Strombos horns, wooden chests, bicycle wrenches, etc.  
Smith & Hemenway Co., Inc., 114 Colt Street, Irvington, N. J., 800 diagonal cutting pliers, 23,000 side cutting pliers.  
Curtiss Aeroplane & Motor Corp., Buffalo, N. Y., spare parts, aileron guides, tubular braces, front and rear instrument boards, hanger brackets, rudder guides, bolts, pins, washers, etc.  
Burd High-Compression Ring Co., Rockford, Ill., 30,000 Burd compression piston rings.  
Disco Electric Mfg. Co., 500 Howard Street, Detroit, Mich., 1000 synchronizing generators.

July 16, 1918.

American Chain Co., Bridgeport, Conn., 1000 chains.  
Disco Electric Mfg. Co., 500 Howard Street, Detroit, Mich., 5310 synchronizing generators.  
Engel Aircraft Co., Niles, Ohio, spares for JN4-D planes, axles, engine-bed bearers, cowls, elevators, landing gears, etc.  
Engel Aircraft Co., Niles, Ohio, 10 JN4-D airplanes.  
Stromberg Motor Devices Co., Chicago, spares for Hispano-Suiza engines, 40 sets of carburetors and spares.  
General Electric Co., Schenectady, N. Y., 25,000 regulator tubes, 30,000 ballast lamps.

July 18, 1918.

Western Electric Co., 463 West Street, New York City, 10,000 radio telephone head sets.  
Western Electric Co., 151 Fifth Avenue, New York City, electrical supplies, 1500 splicing lamps, 320 grips, 17,612 bridle rinks.  
Bristol Co., Waterbury, Conn., 1000 air speed indicators.  
Westinghouse Electric & Mfg. Co., 803 Hibbs Bldg., Washington, D. C., 2000 airplane radio telegraph transmitting sets.

July 19, 1918.

Western Electric Co., 151 Fifth Avenue, New York City, 10,000 antenna systems.

July 22, 1918.

Pierce-Arrow Motor Car Co., Buffalo, N. Y., 1000 300-hp. Hispano-Suiza engines.

July 23, 1918.

Goodyear Tire & Rubber Co., Evans Bldg., Washington, D. C., auto supplies, 19 tires.  
Splitdorf Electrical Co., Newark, N. J., parts for Dixie magneto, model 825; breaker

## Contracts

covers, lock cups, condensers, magneto wrenches, breaker-fastening stud nuts, etc.

July 24, 1918.

The Holt Mfg. Co., Peoria, Ill., 50 caterpillar truck adapters for F. W. D. trucks.

July 25, 1918.

Linde Air Products Co., 42 So. Boulevard, New York City, 600,000 cu. ft. of free oxygen.  
Penrod Walnut & Veneer Co., Kansas City, Mo., 210,000 ft. walnut lumber.  
Thomas-Morse Aircraft Corp., Ithaca, N. Y., spares for 150 S-4-C gunnery planes, axles, cowls, elevators, landing gears, rudders, upper and lower wings, etc.  
Fay & Bowen Engine Co., Geneva, N. Y., 6000 center camshaft bearings.  
Dyneto Electric Corp., Syracuse, N. Y., 55 electric generating sets.

July 26, 1918.

General Rim Co., 47 West Thirty-fourth Street, New York City, license agreement. The right under patent No. 1,135,424, in the Government to make or to have made, and to use and sell during the period of the war and for war purposes only, wire wheels covered by said patent.

July 27, 1918.

Curtiss Aeroplane & Motor Corp., Buffalo, N. Y., Spares for 124 JN4H advanced training planes equipped with dual control and forward gun; axles, engine-bed bearer sets, dual controls, cowl systems, elevators, landing gears, radiators, rudders, etc.

## Contracts Awarded by Bureau of Aircraft Production

WASHINGTON, Aug. 12—The Bureau of Aircraft Production has placed contracts as follows:

A. L. Randall Co., 150 North Wabash Avenue, Chicago, Ill., carrier-pigeon baskets and equipment.

Wellington, Sears & Co., 66 Worth St., N. Y., 150,000 yards of balloon cloth.

Eastman Kodak Co., Rochester, N. Y., 50. graflex magazine aero cameras.

General Electric Co., Kellogg Bldg., Washington, D. C. (attention of Mr. C. E. Rowe), 7500 red bulbs; 15,000 white bulbs.

George W. Hartzell, Piqua, Ohio, 68,000 feet walnut lumber.

John B. Ransom & Co., Nashville, Tenn., 40,000 feet walnut lumber.

Coffman Mfg. Co., Washington C. H., Ohio, 25,000 feet walnut lumber.

## Italy Orders "Eagles"

DETROIT, Aug. 8—Italy has ordered twelve of the new "Eagle" boats from the Ford Motor Car Co. The boats are to be used against the Austrian fleet in the Adriatic Sea.

## Navy Department Contracts

WASHINGTON, Aug. 7—Following are contracts which have been placed by the Bureau of Supplies and Accounts of the Navy Department:

Cleveland Pneumatic Tool Co., Cleveland, drills.  
Ingersoll-Rand Co., New York, drills.  
Chicago Pneumatic Tool Co., New York, drills.  
Ford Motor Co., Detroit, truck chassis.  
Carolina Aircraft Co., Raleigh, N. C., flying boats.  
Curtiss, A. & M., Corp., Buffalo, flying boats.  
Lang Propeller Co., Jamaica, N. Y., propellers.  
Ford Motor Co., Detroit, two ambulances.  
Maxwell Motor Co., Detroit, trucks.  
Studebaker Corp., Detroit, motor truck.

## Army Ordnance Department Contracts

WASHINGTON, Aug. 7—Following is a list of contracts and purchase orders recently placed by the Army Ordnance Department:

International Harvester Co. of New Jersey, Chicago, body castings.  
Commerce Motor Car Co., Detroit, books.  
The Standard Parts Co., Cleveland, perfection heaters.  
Atwater-Kent Mfg. Works, Philadelphia, machine-gun sights.  
The Nash Motors Co., Kenosha, repair parts for Quad trucks.  
Motor Trucks (Ltd.), Brantford, Ontario, machining shells.  
American Brass Co., Waterbury, and Michigan Copper & Brass Co., New York, blasting machine.  
Briscoe Motor Corp., Jackson, rifle grenades.  
Michigan Motor Specialties Co., Detroit, cartridge clips.  
Nash Motors Co., Kenosha, water pump.  
Nash Motors Co., Kenosha, instruction books.  
Chicago Pneumatic Tool Co., Philadelphia, heavy-duty electric drills.  
North & Judd Mfg. Co., New Britain, tongueless bar buckles and check D bronze for cavalry bridles.  
Nash Motors Co., Kenosha, repair parts for Nash Quad trucks.  
Cleveland Tractor Co., Cleveland, commercial tractors.  
Hutchins Car Roofing Co., Detroit, tool fastenings for repair trucks.  
Electric Auto-Lite Corp., Toledo, panoramic sight extensions.  
Electric Auto-Lite Corp., Toledo, sight levels.  
C. A. Shaler Co., Waupun, vulcanizing outfit for artillery repair trucks.  
Studebaker Corp., South Bend, artillery wheel fastenings and hubs.  
The Four Wheel Drive Auto Co., Clintonville, various equipment on F. W. D. trucks.  
L. S. Starrett Co., Athol, miscellaneous tools for repair shop trucks.  
Firestone Tire & Rubber Co., Washington, demountable tires for Nash Quad trucks.  
Cleveland Pneumatic Tool Co., Cleveland, gaskets for mobile repair shop.  
The White Co., Cleveland, 1-ton truck chassis.  
The Four Wheel Drive Auto Co., Clintonville, repair parts for F. W. D. trucks.  
International Harvester Co. of New Jersey, Chicago, and Stewart-Warner Speedometer Corp., Chicago, rifle grenades.  
Dayton-Wright Airplane Co., Dayton, bomb release mechanisms.  
Doehler Die Casting Co., Brooklyn, die castings.  
Grant Motor Car Corp., Cleveland, machining shells.

# AUTOMOTIVE INDUSTRIES

## The AUTOMOBILE

PUBLISHED WEEKLY  
NEW YORK, AUGUST 22, 1918

Ten cents a copy  
Three dollars a year

*"There's the Continental Red Seal Motor!  
Now I know it's a good car."*

America's Standard  
Passenger Car Mo-  
tor. Look for the  
Red Seal Name-  
plate.

America's Standard  
Truck Motor. Look  
for the Red Seal  
Nameplate.

When you buy an automobile or truck, the Continental Red Seal assures you 100% motor value, guaranteeing its power, its speed, its economy, its reliability.

But it does more than that. The Red Seal also provides strong evidence that you possess not only a good motor, but a good car or truck.

For certainly the manufacturers that use the Continental Motor in their product have thereby proved their intention to buy recognized value—not experiments of doubtful quality. When Continental leads the specifications, it is reasonable to assume that the other units in the product are likewise reliable.

Naturally, therefore, these manufacturers are among the most prosperous in the motor vehicle industry. They enjoy the confidence of the buying public. They secure and retain the best dealers. Their automobiles and trucks sell successfully, because they are manufactured successfully.

Look for the Red Seal on the motor in the car or truck you buy. It's your guarantee of motor quality—as well as assurance of a good car or truck.

STANDARD POWER FOR AUTOMOBILES AND TRUCKS

# MASTER TRUCKS

The biggest thing we can say about Master Trucks—the one thing that ought to interest you—the dealer—who is looking for a profitable truck line—is that the slogan

## Master of the Load on Any Road

really tells the Master story.

Master construction in every part is bigger—stronger—than necessary.

Consequently when you sell a Master Truck you are not spending your profits in service. We want a few more good dealers who want a full line of trucks that have made good.

Master Trucks are made in the following sizes:

2 ton "M", internal gear drive  
2 ton "O", long wheel base internal gear drive  
2 ton "W", worm drive

2 ton "WL", long wheel base worm drive  
3½ ton "A", worm drive  
5 ton "B", worm drive  
6 ton Tractor "T"

New Régime Fathered Standardized War Truck Program  
A Year Ago

---

SHAKE-UP IS A REBUKE TO LOBBYING AND POLITICS PLAYED  
IN LAST EIGHT MONTHS

By Allen Sinsheimer

**W**ASHINGTON, Aug. 20—The Motor Transport Corps of the United States Army, completely controlling all motorized vehicles excepting creeper-type tractors, has been formed by a Presidential order.

This department is directly responsible to General Peyton C. March, Chief of Staff, and to the General Staff. It is headed by Brig.-Gen. C. B. Drake, who was formerly a colonel under Brig.-Gen. Chauncy B. Baker, who was in charge of the original Motor Transport Section of the Quartermaster Department.

The new order abolishes the present Motor Transport Service of the Quartermaster Corps, which is headed by Col. Fred Glover. Colonel Glover will remain with the Quartermaster Department. Col. E. S. George, who was second in command under Glover, will be transferred

back to the Signal Corps or possibly to the Air Service.

Col. James F. Furlow, who was lieutenant-colonel under General Baker, will be second in command of the new Corps. Colonel Furlow is now a colonel in the General Staff and will be detailed from it, together with Lieut.-Col. Seamon, to the Motor Transport Corps. Lieut.-Col. Seamon will be third in command. It is likely that General Drake will have the title of Director, and Colonel Furlow, Deputy Director. It is considered probable that the original AA  $\frac{3}{4}$ -ton truck and the A  $1\frac{1}{2}$ -ton truck will be reinstated in the program, and will be ordered in large quantities. The B 3-ton truck will, of course, be retained.

The new Corps will have complete charge of the technical supervision of all motor vehicles, design, production, procurement, storage and supply of them and the

**COLONEL  
C. B. DRAKE**

*of the General Staff,  
who will be Brigadier General in  
charge of the Motor  
Transport Corps*

parts, and their operation, maintenance and salvage. Provision is made in the order giving complete control of all motorized vehicles to the Corps except those used for special purposes by various army departments, such as ambulances for the medical department, over which the Motor Transport Corps will merely maintain supervision after they have been produced and delivered to the medical department.

The Motor Transport Board, which was created earlier this year and is composed of a representative of each army division interested in or using motorized vehicles, will be retained to participate in the design or construction of vehicles by suggestion. Officers of the Motor Transport Corps will be detailed to each army division, corps and department to be in command of the Motor Transport Corps within the limits of that division.

All existing contracts for motor vehicles, motor vehicle equipment and supplies, maintained, operating and repairing of motor vehicles will be taken over by the Motor Transport Corps, which will make all future purchases and disbursements.

This complete reorganization and shake-up is pregnant with significance. It marks the end of a year which has been filled with upheavals in the military truck field. A year ago the military trucks and other motorized vehicles were under the control of the Motor Transport Section of the Quartermaster Corps, chief of which was General Baker. Christian Girl was in charge of production. In the summer of 1917 General Baker, assisted by numerous engineers from the automobile industry, developed the design for three types of trucks to be manufactured by truck makers of this country, and which were regarded as trucks especially designed for our army. They comprised the AA  $\frac{3}{4}$ -ton, the A  $1\frac{1}{2}$ -ton and the B 3-ton models. The B truck was designed

and completed first. The first models were delivered in Washington late in 1917 and received officially by President Wilson and Secretary of War Newton D. Baker. Eighteen thousand of these have been ordered and more than 10,000 delivered.

Opposition developed to the standardized trucks, as these were known because of their standardization of parts and uses. Some truck manufacturers claimed that the trucks were not equal to their privately made commercial trucks. Some objected to the low margin of profit. Others were anxious to foist their own products on the Government.

There was considerable propaganda. There were reports pro and con about the stability of the trucks. Politics were played. Changes in organization came. The Motor Transport Service was formed a few months ago and tests were held of all makes of trucks. The B truck was retained under the new régime. The original A was discarded and replaced by the White  $1\frac{1}{2}$ -ton truck. The original AA was discarded and replaced by the G. M. C. truck.

After ten weeks of control the Motor Transport Service has been disorganized in part and the old organization reinstated.

The organization which was under Mr. Girl, who resigned last spring, is to be retained by General Drake. Capt. E. R. Finkenshtadt will remain in charge of B truck production; George Randles will supervise operations; Captain Miller will retain control of production of passenger cars, trailers, motorcycles and bicycles; and Guy Morgan will have charge of spare parts, tire and accessory purchases. D. C. Hess will remain in charge of priorities. The various branch offices at Chicago, New York, Cleveland and Detroit, it is expected, will be retained in their present form.

The new order is regarded here as decisive and as a rebuke to those who have interfered by means of lobbies and politics during the past year with the motorization program of the army.

General Drake has been connected for many years with the military motor truck development and problems. He is by the new order directly responsible to the Chief of Staff, and, since the order creating the Motor Transport Corps and appointing General Drake was signed by the President and the Secretary of War, these two high officials are practically in a position of vouching for him. Consequently, as a high army official put it to-day, "The election is now over," and hereafter it may be expected that motorized vehicle purchases, procurement and production will be conducted without outside influence and that those individuals who persist in using political methods may expect scant consideration.

Following is the complete general order creating the new Motor Transport Corps:

## Text of Presidential Order Creating Motor Transport Corps

General Orders {      WAR DEPARTMENT  
No. 75                      Washington, August 15, 1918.

1—There is created during the existing emergency, a Motor Transport Corps.

2—There will be detailed a Chief of the Motor Transport Corps.

3—In this order, unless special exceptions are made, the term motor vehicle will be construed to include all bicycles, motorcycles, automobiles, trailers and trucks, by whatsoever staff corps or service they may have been originally supplied and for whatsoever purpose. All motor vehicles with cargo-carrying chassis are classed as

trucks. Tractors of the caterpillar type, designed primarily for traction purposes and tanks, are excepted from the provisions of this order, the Ordnance Department being charged with the responsibility for their supply and maintenance.

4—The functions of the Motor Transport Corps are:

a—The technical supervision of all motor vehicles.

b—The design, production, procurement, reception, storage, maintenance and replacement of all motor vehicles, and accounting for same.

c—The design, production, procurement, storage and supply of spare and repair parts, tools, accessories and supplies of all motor vehicles, and accounting for same.

d—The establishment and operation of all Motor Transport Corps garages, parks, depots and repair shops.

e—The procurement, organization and technical training of Motor Transport Corps personnel.

f—The salvage and evacuation of damaged motor vehicles.

g—The homogeneous grouping of motor vehicles.

h—The operation, in accordance with instructions from the proper commanding officer as to their employment, of groups of motor vehicles of "First Class" as defined in paragraph 5 below.

i—The preparation of plans for hauling cargo and personnel over military roads, or roads under military control will be under the control of the Motor Transport Corps.

j—The procurement, supply, replacement and preliminary training before assignment to combatant organizations, of personnel for operation of motor vehicles of the second class, will be made by the Motor Transport Corps.

5—With respect to the control exercised over them by the Motor Transport Corps motor vehicles are grouped into two classes, viz:

**First Class:** Those the operation of which the Motor Transport Corps controls in the United States and overseas, and for the efficient functioning of which as transportation units it is directly responsible.

**Second Class:** Those over which the Motor Transport Corps exercises merely technical supervision in the United States and overseas.

The first class includes all cargo-carrying or passenger-carrying motor vehicles used for general transportation purposes and the motorized portion of such reserve trains as may be held for general transportation purposes in rear of an army, under control of the army commander.

The second class includes all motor vehicles not included in First Class. Substantially these will be such motor vehicles as are assigned by Tables of Organization to organizations such as divisions, corps, troops and army troops.

The Motor Transport Corps controls the operation of First Class vehicles, but merely maintains a technical supervision over the operation of Second Class vehicles. This technical supervision will, however, be interpreted very broadly by all concerned. Bulletins will be published from time to time concerning the proper methods of operation, care and maintenance of motor vehicles. Motor Transport Corps officers will keep themselves constantly informed as to how motor vehicles of the organization to which they are attached are being used and will report to the proper commanding officers any abuse which they discover. The commanding officers to whom such reports are made will hold to strict responsibility any officers who have motor vehicles under their control which have been in any way damaged or injured on account of disregard of the proper methods of operation, care and maintenance laid down by such bulletins.

When vehicles are placed in the Second Class, the Motor Transport Corps officer supervising them has no authority to determine the use to which they are put; he merely guarantees that they shall perform as efficiently as possible whatever work the commanding officer chooses to assign them.

When vehicles are placed in the Second Class, the commanding officer of the unit to which they are allotted is directly responsible for their efficient functioning, to the same degree as is the Motor Transport Corps officer for vehicles in the First Class.

6—All garages, parks, depots, repair shops and similar establishments of the Motor Transport Corps will be manned and operated by Motor Transport Corps per-

### COLONEL J. F. FURLOW

who will be second  
in command of the  
newly organized  
Motor Transport  
Corps

sonnel, and their commanding officers will report direct to the Motor Transport Corps officer on the staff of the unit or of the organization to which they are attached. Any such establishments which may now be in existence are hereby placed under the control of the Motor Transport Corps in the manner stated above.

7—Motor vehicles and their spare parts, motor vehicle shops and shop equipment, tools and accessories purchased by other staff corps or services will be turned over to and invoiced to the Motor Transport Corps and assigned by the Motor Transport Corps in accordance with the Tables of Organization, and as the best interests of the service dictate, regardless of their original source of procurement; except that ambulances and non-cargo and non-personnel carrying motor vehicles such as mobile repair shops, especially designed for Ordnance, Signal Corps and Engineering Corps, gun mounts, rolling kitchens, laboratory trucks, wireless trucks, photographic trucks, searchlight trucks, water sprinklers, will be held by the Motor Transport Corps subject to the orders of the staff corps or service for which they have been purchased. In the case of such ambulance and non-cargo carrying vehicles, the Motor Transport Corps will provide parking facilities for their reception and furnish facilities for the maintenance of the chassis and of such other parts as may be arranged for between the Motor Transport Corps and the other staff corps or service concerned. Property accounting for all motor vehicles and for chassis of special vehicles above mentioned will be made to the Chief of Motor Transport Corps.

8—All questions which may hereafter arise affecting the design or construction of motor vehicles procured by or for any staff corps or service, in so far as concerns the chassis, or any element with the supply or maintenance of which the Motor Transport Corps is concerned, will be decided by approved recommendation of the Motor Transport Board, appointed by Special Orders, No. 91, War Department, 1913, with a view of securing standardization of design and type and of facilitating repair and replacement.

9—The chief of each staff department now purchasing or operating motor vehicles will submit on or before August 31, 1918, a list of all personnel and organization who are performing Motor Transport duty under provisions of paragraphs 4 and 5 preceding. He will submit with the list the names of technical personnel which he desires to retain for use under provisions of paragraph 7 preceding. All personnel and organization except that approved to be retained, will be transferred to the Motor Transport Corps on August 31, 1918.

10—In each army, corps and division, the army artil-

Total ..... 5,466,931

Total Now in Use in U. S. Is 5,466,931,  
an Increase of 525,665 in Six Months

THE gain of 525,665 motor vehicle registrations between January 1 and July 1 of this year when analyzed shows that this gain is not made up in the large population areas but rather through the grain belt of the Mississippi Valley and the Solid South, which started its motor boom over a year ago.

The registration figures for the first six months of this year afford the first real opportunity of studying the use and distribution of motor vehicles under war conditions. Registration begins in most states with the opening of the year, and the registration figures of July 1 as compared with January 1 afford a definite basis of studying trends as influenced by the war.

The total motor vehicle registration as of July 1, 1918, was 5,466,931 net, that is, not including any duplicate registrations. For the first time the five and one-half million figure was almost reached. The registrations last January showed that 4,941,276 motor vehicles were in registered use. The figures as of July 1 show a 10 per cent increase.

These figures include automobiles, trucks, motor buses and trailers where the latter are registered. From this figure all duplicate registrations have been subtracted, so that 5,466,931 pretty accurately represents the vehicles in use on July 1.

For the first time several states show a reduction in registrations as compared with January 1 of this year, a fact which might indicate that

there are in such states many cars that have not been registered and which obviously cannot be in service but are perhaps in storage. It is quite surprising that of the six states that have a smaller registration, or show a shrinkage in the last six months, three are typical agricultural states, two of them manufacturing states and one falls into a miscellaneous classification.

The six states showing an actual loss include Massachusetts and New

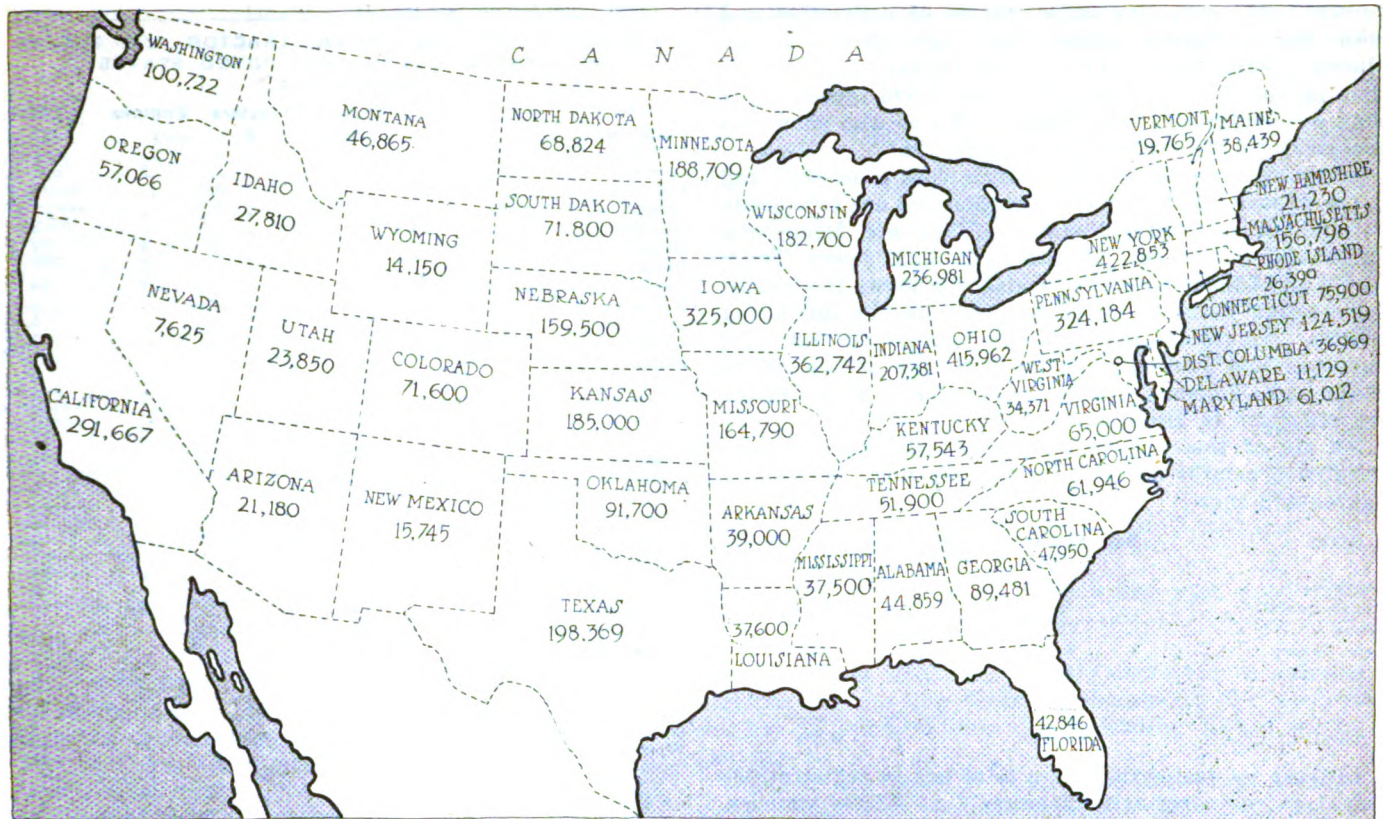

Chart showing the yearly increases in registration, output and value of cars and trucks since 1911

NOTE.—Steam cars and trucks are included with the gasoline vehicle statistics, as segregation is not carried out by registration officials. \*Number of registered owners by citizens of other States. \*\*Number of vehicles re-registered, owing to transfer of ownership, etc. .... Statistics not available. †This is an independent column, having no relation to the figures given in any other.

Jersey, both containing large centers of population and both manufacturing rather than agricultural states. Massachusetts had on July 1 7,890 fewer registrations than on January 1. New Jersey had 4,596 fewer July 1 than on January 1. The State of Maine also showed a decrease of 1,961 during the same period.

The remaining three states which show a decrease fall in the Mississippi Valley classification and are practically out-and-out agricultural states. They are Minnesota, Texas and Oklahoma. Minnesota is 3,281 lower, Texas 5,161; and Oklahoma 9,499. Oklahoma shows the largest registration decrease of all six that are in the losing column. Unquestionably the dry weather in the past year has had something to do with the falling off in Texas and Oklahoma, but no reason can be advanced for the reduction in Minnesota.

All six of these losing states showed large gains in the first six months of 1917, as the following comparative figures will show:

State	Gain first six months 1917	Loss first six months 1918
Oklahoma	19,728	9,499
Massachusetts	6,061	7,890
Texas	2,313	5,161
New Jersey	44,253	4,596
Minnesota	30,500	3,281
Maine	3,618	1,961
Total	106,473	32,388

In these six states there is a total loss in registrations July 1 as compared with January 1 of 32,388 vehicles. When these figures are contrasted with those for the first six months of 1917, when there was a registration gain of 106,473, the influence of the war on certain sections becomes at once apparent.

In the cases of New Jersey and Massachusetts unquestionably the drop in registration is largely due to the falling off in sales in the large population centers in each state. New Jersey is just across the Hudson river from New York City; in fact, a very large percentage of the business men and women of New York City live in Jersey and their automobiles would come under Jersey registration. Massachusetts has the Boston population.

Next to the falling off in registration in six states is the almost phenomenal gain made by the State of Ohio, which has almost ousted New York from its premier position. Ohio has literally outraced all of the other states in registration since the first of the year. It shows a gain of 83,159 as compared with January 1. The significance of these figures increases when con-

trusted with New York State, where the gain in the same period is only 11,903 registrations. Ohio has more than seven times this gain.

Not only has Ohio outstripped New York State in gains in the 6 months, but it is close on the heels of the Empire state in total registrations. Ohio now has registered as of July 1 415,962 and New York State on the

same date had 422,853. If Ohio continues to gain on registrations for the second 6 months of the year as she has in the first, she will be leading New York by January 1.

Ohio, of all states in the Union, has made greatest gains. Next to her comes California with a registration gain in the same 6 months of 69,052. Iowa, one of the premier farming states and the leading state in number of automobiles in relation to number of population comes third in registration gains this year, its figures showing a gain of 46,787. These three states are by long odds the leaders in registration gains this year, in fact, the others can scarcely be classed as a good second in the running. Pennsylvania, which in 1917 was a big gainer, only shows 19,724 more registrations on July 1 than on January 1 this year as compared with over 35,000 increase a year ago.

It is difficult to reason out just why Ohio should so far outstrip New York, Pennsylvania, Illinois and other states if it is not that the state is a leader in agriculture, and is also a strong manufacturing state, holds a high position in mining and has crude oil interests as well. It seems to be the general prosperity of all of these fields that have combined to put the state in the first place in registration gains.

Apart from the Ohio leadership the utilitarian aspect of the automobile is well evidenced by the fact that practically the fifteen states that lead in registration gains are agricultural states. The list is headed by Ohio, California and Kansas, all three agricultural leaders; and following them come a group of farming states such as

(Continued on page 339)

# Comment on Some Tractor Problems

Tractors Shown at Salina Indicate New Tendencies in Design—Steering Gear a Weak Link—Seating Accommodation for Driver and Control Arrangement

*Wallis tractor with boiler plate oil pan and gear housing also serving as frame*

*Port Huron three-plow tractor with Erd engine*

*Above — The small Avery with four-cylinder engine. On right—Rumely Oil-Pull hauling three groups of six disks each*

A MEETING like that held at Salina recently affords many opportunities for a comparative study of design. It was the big event in the tractor world this year, and practically every concern that amounts to anything in the tractor industry was represented. In addition to the older models with 1918 improvements there were quite a number of entirely new designs. We show herewith a collection of photos taken on the field, which merit inspection by the tractor engineer and manufacturer.

As regards steering of the regular wheeled tractors, there are three different methods now in vogue. There is first the three-wheeled tractor with a single central steering wheel, which commends itself on account of its simplicity. While some of the most successful of the older types come under this heading, all of the new designs have four wheels. There is a possibility that the farmer looks upon the three-wheeled tractor much like the automobile prospect looked upon the three-wheeled motor car offered during the early years—as a makeshift and a freak. Of course, that the three-wheeler lost out in the automobile field is no proof that it does not possess merit as a tractor, but the great predominance of four-wheelers tends to confirm those who are prejudiced against the three-wheeler in their opinion, and adds to the sales resistance that must be overcome by the sponsors of the three-wheeler.

## The Steering Problem

Some manufacturers have endeavored to secure the simple steering arrangement of the three-wheeler with the four-wheeled construction. They were evidently impressed with the advantages of the three-wheeler but wanted to reduce sales resistance. This led to the adoption of the construction employing two front wheels rather close together on a solid axle adapted to be rocked around a central vertical pivot.

Steering gears are evidently one of the weak points of the tractor. This may be partly accounted for on the ground that automobile steering gears, designed for

*Emerson-Brantingham pulling three plows*

*Driver's stand on Parrett is used for women drivers*

*The new Avery pulling four plows*

*Bates steel mule hauling disk roller*

much lighter work, have been applied to tractors because they could be purchased advantageously. On the other hand, where tractor manufacturers make their steering gears themselves the design frequently has not received the attention it deserves. It is absolutely essential that a tractor steering gear be completely housed in, and the provisions for oiling its bearings and other wearing surfaces should be most carefully worked out. The chief cause of trouble with steering gears seems to have been due to the fact that often they are not sufficiently rugged to withstand the maximum strain rather than excessive wear, for in plowing, at least, the tractor is largely self-steering.

There is a tendency noticeable to approach the smooth outside lines which are so much appreciated in the passenger automobile. No one expects the tractor to serve as an ornament, but it is a fact that in the evolution of any machine the higher the state of perfection reached the more "sightly" or "attractive" the machine usually becomes.

#### Location of Driver

There is quite a variation also in the seating arrangements for the driver. Some designers place the driver in a comparatively high position, evidently with the object of enabling him to see the ground close in front of the tractor. The problem of seat location is, of course, closely related to that of control arrangement. Some day, no doubt, we will have standardized tractor control the same as we now have standardized control for passenger cars and motor trucks, but that day seems still a great ways off. All control devices should be arranged so that they can be conveniently operated from the driver's seat; it should not be necessary for the driver to go through contortions or acrobatics to change gear or apply the brake, but these functions should be capable

*Plowman tractor hauling two plows*

*Rumely 12-24 tractor pulling four disk plows*

*Three sizes of Russell tractor in line**Fordson tractor pulling two plows**Converted Ford car pulling two plows, very shallow**Happy Farmer pulling four plows*

of being performed in a natural, easy way. The demand for ease of operation will increase as the labor shortage becomes more acute and boys and women will largely have to operate the tractors.

Many of the tractors demonstrated at Salina were provided with cabs, and it is quite conceivable that when the temperature in the shade ranges between 100 and 110 degrees, or during a rain, they are quite a comfort, but under normal atmospheric conditions the average driver would probably prefer to sit out in the open.

#### Improvement of Details

In a tractor we cannot expect the finish and general finesse that we have become accustomed to in automobiles, yet it is evident that there is much need for improvement in design. Many tractors in the past have been built unduly heavy because the designers were under the impression that they needed weight for traction anyhow and there was no sense in cutting weight. However, the weight is only one of the factors determining the limiting traction and not all of the weight of the tractor is effective in increasing the traction. On the other hand, every pound of unnecessary weight that is lugged around means just so much waste of fuel.

What is needed is a thorough discussion of tractor design by men familiar with present day practice. An interchange of ideas and experiences would greatly help to accelerate the progress of this most essential device. The individual designer, of course, will gain much valuable information from the service department regarding weaknesses developing in the field, but an exchange of ideas and experiences among different designers would broaden the view of each.

**A** FIRE-ALARM system, the detector part of which consists of a very fine copper tube cleated around through various parts of the building, is made by the Aero Fire Alarm Co., 26 Cortlandt Street, New York City. If a fire occurs, the air in the tube is heated, causing it to act on a diaphragm which connects an electric circuit and rings the alarm.

# The S. E. 5A Single Seater Fighter

Mechanical Details of British Machine Which Has Been Adopted by Our Army Authorities Weighs 1554 Lb. Without Load and Is Equipped with 200 Hp. Hispano Engine

**I**N the Aug. 8 issue of AUTOMOTIVE INDUSTRIES we published a photograph of the British S.E.5A (Scouting Experimental) plane. Some further details are now available, a technical description of a captured machine having appeared in the German air-craft periodical *Luftwaffe* for March.

The machine described was built by Vickers, Ltd., and carried the number B-507, besides an A to designate the squadron it belonged to, as well as a white circle. The propeller was marked S. E. 5A, which suggests the idea that the machine is a development of the S. E. 5, which was fitted with a 150-hp. Hispano engine.

The wing surface is equal to 246 sq. ft., and both wings have a span of  $26\frac{3}{4}$  ft. There is only a single inter-plane strut on each side of the body. The chord of the wings is 5 ft., and the gap from the top of the fuselage amounts to 1.65 ft. There is no sweep-back, but both the upper and lower wings have a dihedral angle of 1.71 degrees. Both sets of wings are of equal size, the upper set being mounted on the center section over the fuselage, and the lower set on to wing stubs. The field of vision is increased by cutting away a portion of the wing near the body. The upper wings have an angle of incidence of 5 deg. mean, while the lower wings have an angle of incidence of 6 deg. near the body and 5 deg. at the struts.

Both spars of the wings are of I section, while the spars of the wing stubs, which run through the fuselage, consist of  $1\frac{3}{4}$ -in. steel tubes, with a wall thickness of 0.169 in. There is nothing unusual in the design of the ribs, these being along conventional lines of British construction. There are no compression members or struts between the spars, but instead some of the ribs are of solid section between the spars. The internal wiring of the wings, between the fuselage and the struts, is of ordinary drawn wire, whereas the internal wiring of the overhanging portion of the wings is of swaged wire.

The trailing edge of the wings consists of a wood strip. Further, there are two auxiliary ribs between each pair of main ribs from the leading edge to the main spar. The fabric is sewed to the ribs, and is painted yellow on the under-surface of the wings, and brown above, as is the fabric of the fuselage. Grummets are put in place on the under side, near the trailing edge of the wings.

The center section struts are covered steel tubes. The spruce struts of the wings rest in long stampings, which serve also as attachment fittings for the vertical wiring. Stream line wire is employed for the plane cross wiring, with double wires for flying and single wires for landing. The two spars of the upper planes are strengthened between the center section and the struts by two wires each. Unbalanced ailerons are hinged to the rear cross-bar of both upper and lower planes.

The body is of the usual strut and wire design, having semicircular frames and fairings on top, and three-ply wood planking of 0.16 in. thickness to the pilot's seat. Both the longerons and struts of the fuselage are of I-section, with the exception of the vertical struts behind the pilot's seat, which are of circular section.

The tail-plane is curved on both sides, and is fixed to the body in such a manner that the angle of incidence can be varied during flight, between the limits of plus 4.5 deg. and minus 3 deg. In order to make this possible, the front spar is made turnable, while the rear spar, with its wiring, is fixed to a tube, so arranged that it can be shifted relative to the stern post of the fuselage. This tube rests with a piece of thread in a gear nut, which latter in turn is supported by the stern post.

When the nut is turned from the pilot's seat by means

Front view and plan of S. E. 5A biplane

of a hand wheel and cable, the tube is displaced upwards and downwards, transmitting the same motion to the rear spar of the tail-plane, thus changing its angle of incidence. The elevator, which is hinged to the fixed tail-plane, takes part in this motion. The wires for operating the elevator are led through the fuselage and tail-plane, the obvious object being to reduce the air resistance. However, this arrangement necessitates two turns of 20 deg. in the wire. Both the main and the tail-plane are fitted with Cellon windows.

The landing gear is of conventional design. The one-piece axle rests between two auxiliary axles. There is no limit to the spring action. The tail-skid is somewhat unusual, in that it is arranged in a rotary manner be-

The S. E. 5A, adopted by the U. S. Army. The elevation shows the 18.1-in. positive lead of the planes. The overall length is 21 ft. 1 in. and the total weight is 1554 lb. without load

hind the stern post and is connected with the rudder cable through the intermediary of springs. A brass skid bow is sprung by means of two helical springs, which are prevented from side-wise motion by inserted telescope tubes.

According to the name plate, the Wolseley-Hispano-Suiza engine on August 30, 1917, delivered 206 hp. at 2005 r.p.m. A reduction gear, giving a speed reduction of 4 to 3, is used between the engine and the four-bladed propeller. The exhaust gas is connected through two exhaust pipes, one on either side of the body, to the rear of the pilot's seat. The engine is so arranged that it is readily accessible after the bonnet has been removed. The radiator forms the front of the fuselage.

### Fuel Supply for Two Hours' Flying

The main fuel tank, having a capacity of 32 gallons, is placed behind the engine on the upper longeron of the fuselage. A gravity tank of 4.5-gal. capacity is arranged in the center section between the leading edge and the main spar. The oil tank, which has a capacity of  $3\frac{3}{4}$  gal., is supported on the engine frame below the rear edge of the engine. The fuel supply carried is sufficient for about two-hours' flying.

Following is a list of the equipment carried in the pilot's compartment: To the right there are a box of light pistols, a switch for the self-starter, a switch for the two magnetos, a three-way valve for the two fuel tanks, a three-way valve for the hand and engine-driven air pump, a radiator thermometer, a fuel gage placed on the rear side of the main tank and a pressure gage to indicate the air pressure.

On the left are a gas lever, a lever for adjusting the fuel supply according to the altitude, a lever for operating the radiator shutters, and a clip for three light cartridges. Below there is a hand-pump for the hydraulic-machine-gun gear, and two boxes for drums for the movable machine-gun and self-starter.

A square windshield of Triplex glass is placed in front of the pilot's seat. Behind this is a box which is accessible from the outside. The fixed Vickers machine-gun is located to the left of the pilot inside the fuselage, and its cartridge belt is of metallic construction. The machine gun is fired by means of a hydraulic mechanism.

Connection is made to the engine at the forward end, the connecting means consisting of a copper pipe. There is also a drive through gearing from the propeller.

On the bow-shaped iron band, lying on the center section, rests a Lewis gun, which can be lowered during flight to permit of vertical firing.

The weight of the machine without load amounts to 1554 lb., which is made up of the following items:

	Lb.
Engine .....	495.0
Exhaust system .....	26.6
Self-starter .....	8.0
Radiator .....	52.4
Cooling water .....	68.2
Propeller .....	58.5
Main fuel tank .....	39.1
Gravity fuel tank .....	14.3
Oil tank .....	8.6
Engine equipment .....	14.1
Body with seat and plate covers .....	332.0
Elevator control .....	4.2
Landing gear .....	90.0
Tail skid .....	8.1
Control gear .....	11.9
Planes with wiring .....	247.0
Wire bracing .....	46.2
Body equipment .....	30.8

Total .....1554.0

When the tanks are completely filled the plane carries 244 lb. of fuel, so that the total useful load can be figured at 550 lb. and the total weight, loaded, of the plane at 2104 lb. The wing load is thus  $2104 \div 246 = 8.55$  lb. per square foot and the load in relation to horsepower  $2104 \div 200 = 10.52$  lb. per horsepower.

## Asbestos Production

DOMESTIC asbestos to the amount of 1683 short tons, valued at \$506,056, was sold during 1917, according to the U. S. Geological Survey. This represented an increase of about 13 per cent in both quantity and value over 1916. Arizona produced the greater part of the domestic asbestos used. The proportion of crude spinning fiber to that of lower grades is much larger there than in Canada. As a result, the average price of American fiber in 1917 was \$301 a ton, while the average price of that produced in Canada was only \$50 per ton.

The impression which has been prevalent for some time that the Arizona fiber contains less iron than that obtained in Canada has recently been confirmed by an analysis made by R. E. Zimmerman, of Pittsburgh. Mr. Zimmerman's investigation also indicates that thin films of calcite among the fibers cause the harshness of certain parts of the asbestos from Arizona.

# Selection, Training and Supervision of Women Workers

**More Than 600 Carefully Chosen Female Operatives Now Employed at Nordyke & Marmon Plant—How High Employment Standards Are Maintained—Training Methods**

**A**FTER six months' experience with women on extremely varied kinds of work and many different operations in its production departments, the Nordyke & Marmon Co. of Indianapolis has arrived at the conclusion that there are many advantages to be derived from the employment of women by manufacturing establishments.

It seems to be the unanimous opinion of the various superintendents, foremen, female supervisors and officials of the company, so far as conclusions can be formed on the data available, that for one thing it is easier to break in women as beginners; that is, that they learn more rapidly than the grade of men now available. But in weighing this conclusion one must keep in mind that the company has made it a point to employ only women who are distinctly above the average of female factory workers.

The Nordyke & Marmon Co., when it turned its attention to female labor in the great emergency, started out with the purpose of employing only those who measured up to certain high standards, physical, intellectual and moral. Women employees were carefully selected from applicants, and it is the belief of the examining physicians and others who had charge of the work of selection that the average of the women employed was unusually high.

## More Than 600 Women Now Employed

Women between the ages of 20 and 40 are employed throughout the plant in all three of its main divisions; the automobile, aviation engine and flour mill divisions. The only variation made from these age limits is in the case of mail carriers, for which positions girls of 18 years and up are taken on. More than 600 women are now employed throughout the plant, and it is believed,

## Departments in the Nordyke & Marmon Plant in Which Women Are Employed

<i>Tool crib</i>	<i>Miscellaneous Steel</i>
<i>Rocker arm</i>	<i>Connecting-Rods</i>
<i>Cylinder</i>	<i>Welding</i>
<i>Miscellaneous Aluminum</i>	<i>Crankcase</i>

*In all of these departments Government work is being performed.*

because of the requirements of Government work, that this number will be materially increased shortly, the expectation being that eventually, and it might be said, as soon as possible, the company will have about 1000 women on its pay-roll.

In the selection of women employees, while mental and moral characteristics are given careful consideration, the physical standard set for successful applicants may be said to be the controlling one. Each applicant is thoroughly examined by the plant physician. The examination covers the following points: Height, weight, eyesight, hearing, color perception, rate of pulse, respiration, evidence of incurable diseases, and immoderate use of stimulants, evidence of abdominal diseases, scars, deformities, examination of the nose, mouth, teeth, tonsils, throat, palate and tongue, mentality, general physical condition and personal appearance.

The high standards are maintained after employment by careful supervision, directed by the company's superintendent of women and a staff of supervisors. Another

## What Women Are Doing in the Nordyke & Marmon Plant

### AUTOMOBILE DIVISION

*Operating:*  
*Hand milling machines.*  
*Drill presses.*  
*Grinders.*  
*Sewing machines.*  
*Inspecting.*  
*Assembling light parts.*

### AVIATION ENGINE DIVISION

*Operating:*  
*Small drill presses.*  
*Speed lathes.*  
*Milling machines.*  
*Grinders.*  
*Profile machines.*  
*Welding: acetylene and arc.*  
*Scraping small aluminum parts and crankcases.*  
*Inspecting engine parts received from outside.*

### GENERAL

*Floor sweeping (by colored women).*  
*Laundry work (on women's factory suits)*  
*Shipping.*  
*Time-keeping.*  
*Messenger service.*  
*Clerical work in production departments.*

*In the training room for women at the Nordyke & Marmon plant all applicants are given sufficient instruction to acquaint them in a general way with the machines they will operate and to overcome "stage fright" usually experienced by beginners plunged immediately into the production department*

contributing factor to the maintenance of the high standards of employment is that every effort is made to make the plant attractive to the better class of women and the girls and to provide the best of working conditions. As the superintendent of women points out, the female employees find new, modern factory buildings with good light and ventilation, good discipline, a clean, moral atmosphere, rest rooms equipped with comfortable chairs, lounges, magazines, piano, etc., dressing rooms, adequate safety devices for all hazardous work, first aid equipment, good restaurant facilities and supervision administered in a protecting, helpful and kindly spirit.

Undoubtedly another factor which conduces to the maintenance of a high standard is the payment of a very fair compensation for services. Beginners receive 22½ cents per hour for 8½ hours per day, 5½ days per week, and are paid time and one-half for overtime and double time for Sunday and holiday work.

### Hours and Wages

The average female employee works from four to six weeks at this rate of pay. Piece work rates offer the opportunity to earn from \$15 to \$25 per week. In departments where piece work is not practicable and it therefore becomes necessary to work on a straight hour basis, the company has, in several instances, increased the rate of pay without waiting for requests from those women who have shown themselves capable of getting ahead and of producing at a higher rate.

About 75 per cent of the women who have been employed so far by the Nordyke & Marmon Co. have completed at least the common school grades, and many of them have been through high school. Some are college women. It is the belief at the plant that the capacity of these women to learn is increased by the intense interest which they take in their work and the patriotic desire to serve their country at this particular time. Many of the women employed have husbands, brothers or other relatives fighting at the front.

It was found in the welding department that women did not pick up the intricacies of the job as quickly as men, but the slowness in learning in this case is more

than offset, according to the foreman of the department, by the fact that many of the women become eventually better welders than the men. They make better looking welds and apply themselves more thoroughly to the work. It has been found necessary to explain the operation of welding more frequently to women than to men, which is accounted for possibly by the fact that the average man has had more experience in similar work. So far, women in the welding department have not developed the capacity of men to turn out a quantity of work, but it is not felt that conditions have been right so far for a fair and sufficient test.

### What the Company's Experience Indicates

Other indications which have been observed in this particular organization are:

*That among women employees a larger percentage make good after their original employment than among men employees.* (For example, the foreman of the connecting-rod department has put himself on record to the effect that out of 30 women, who have been tried out, he has been obliged to reject only five as unfit for the work.)

*That women make better inspectors than men when employed in inspecting small parts.*

*That women spoil less stock than men, thereby materially reducing the loss by scrap.* (It has been found that after the first three or four days most women operators spoil very little stock.)

*That women are more inclined to stick to their jobs closely and are more attentive than men.*

*That they are willing and glad to work overtime.*

*That the attendance of women is extremely good and cases of tardiness are infrequent.*

*That women maintain better discipline than men, owing probably to the novelty of their employment and their desire to learn a new vocation.* (It is admitted that conditions in this regard may change as the women become better acquainted with their surroundings.)

*That with equal experience, women are better at clerical work than men.*

*That there is little if any difference in the output capacities of men and women.* (Several of the foremen

the Nordyke & Marmon plant have said that they can see no difference in the capacities of men and women, while others hold that eventually women will produce more than men under equal conditions. It can be said that so far women are not doing as well as men on such work as scraping crankcases, which is unquestionably hard work. The foreman of the scraping department reports, however, that women are doing well on light work.)

*That the rate of turnover among women seems to be considerably less than that among men.* (The company admits that sufficient data are not yet available for a comprehensive analysis.)

*That the physical limitations of women is the only marked disadvantage and that apparently these limitations will confine them chiefly to the lighter kinds of work.* (The company believes that the larger number of women cannot be given heavy work and that this kind of work must continue to be done by men.)

### Employment Records

The following table, taken from the records of the employment department, is correct as of August 3:

Total number of women applicants.....	3769
Total number of women examined by physician, about .....	1589
Total number of applicants rejected on examination, about .....	304
Total number of women actually working Aug. 3...	661
Total number who have quit since March 11.....	275
Total number of women hired (the sum of the foregoing two items).....	936

### Supervision

The organization in charge of the women working in the Nordyke & Marmon plant comprises one superintendent of women, who has as assistants one supervisor of employment and eight supervisors of factory workers. The maintenance of discipline and a proper moral standard is the chief duty of the shop supervisors. These supervisors also see that the operators are continually supplied with stock, that their machines are kept in proper operating order, and they communicate to the proper authorities all complaints of women operators bearing on alleged unfair time studies upon which piece

work rates are based. These supervisors do not inspect operators nor do they personally provide stock or repair machines, but they do see that these things are done by male employees.

### Uniforms

The company has adopted a uniform system for female operatives, the suits being made in four styles each style indicating a rank or kind of employee as follows: Supervisors and forewomen wear plain machine operators, blue and white stripes; inspectors, blue and white checks; stenographers, clerks, timekeepers, brown and white checks.

The regulation costume consists of blouse and breeches, buttoned at the waist. The company provides costumes and they are sold to the women at \$2.75 a suit, to be paid for at the rate of 50 cents per week. "Liberty Laundry" is operated by the company, and these costumes are washed weekly free of charge.

### The Training School

For the instruction of women applicants for employment in the aviation engine division, a preparatory school was established on March 25, 1918. Before this school was inaugurated, women had been employed at the plant for a short time and an experiment in instruction had been made which did not turn out satisfactorily. The plan was to make use of the Manual Training High School in Indianapolis and to have the women supervisors of operators receive instruction there in night courses. After three or four nights the idea was given up owing to the fact that neither the applicants themselves nor the requirements of the company were satisfied.

After this, a schoolroom was established in the aviation engine factory, adjacent to the women's rest room and as near as possible to the office of the superintendent of women. A room, 12 x 24 ft., was used. In charge of the instruction was placed a competent and conscientious man who has the faculty of imparting knowledge and creating a keen interest in their work on the part of the women who apply for positions. He had had no teaching experience but was endowed with natural ability and had some experience as a director of work for women factory workers. Besides this he had a ge-

*The rest rooms, equipped with comfortable chairs, lounges, magazines, pianos and other recreational agencies, are by no means the least factors which conduce to the maintenance of a high standard of quality among the company's women employees*

ompletely equipped first aid room at the Nordyke & Marmon plant

perience extending over a quarter of a century, a large part of which he had charge of women s.

equipment of the schoolroom consists of one up-rill press, one milling machine (hand), one power and the following small tools: micrometers, inside outside calipers, thread gages, ring gages, plug dies, drills, reamers, wrenches, files, etc.

#### Method of Instruction

In the training classes a distinction is made as between those who are to become inspectors and those who are to be trained into machine operators. All applicants are, first, instructed in the elementary principles of the equipment and tools. Welding is not taught in the school, as it has been found that this can be done best in the welding department, and it is there done under the supervision of a special male instructor provided by the manufacturer of the welding equipment used.

Except those applicants detailed to the welding department, all who enter the employ of the Nordyke & Marmon receive instruction in the schoolroom for from four to eight hours in the morning of the first day of employment. They are instructed, each for one week period and in groups or classes of from four to eight, according to daily conditions and requirements.

It has apparently been established that this amount of instruction is sufficient for beginners of average intelligence, provided they have had a reasonable amount of mathematical training. Perhaps the chief benefit derived from this training, at least the effect which is immediately noticeable, is the elimination of the "stage fright" experienced by nearly all new employees.

This in itself is really worth while, as it is found in shops which use the shop training method that much valuable time is lost and much good work is destroyed as a result of this "stage fright." The new employee, as she does with the calipers, micrometers and other tools, and learning something about the various machines, is not expected to happen when she does this, or the other thing, to a lathe or drill press, tends to make the new employee much more at ease during her experience in the production department.

It is, of course, quite impossible to give applicants an extensive or prolonged training in such a short time,

but the sole object is to instill in them a perception of the simple principles governing the use of small tools and the operation of the simpler forms of machines. It is the experience of the Nordyke & Marmon Co. that this amount of instruction is sufficient to give the student a good beginning on simple operations in the factory and after it she learns rapidly, becoming her own instructor, as it were.

#### Training Follow-up

The small tools needed for the equipment of each operative are furnished by the company and sold to them at the rate of 50 cents per week.

After passing through the training department or school, the women are assigned to work in the plant on the same day that they begin their connection as employees of the company. They are visited by the instructor for additional instruction and for the purpose of determining whether or not they are making the headway which they should. From time to time they return to the school to be reviewed and to have errors corrected.

It has been found that practically all of the women employed learn very rapidly; in fact, up to a recent date only two out of the many hundreds taken on had given up through discouragement or inability to learn, and they were assigned to other kinds of work where the use of tools was not required.

#### Fitting the Woman to the Job

An effort is always made where dissatisfaction is manifested to keep employees from leaving the company, and frequently women are changed from one operation to another in an effort to find work more congenial to them. They are moved from one kind of machine to another and from one department to another. It is sometimes necessary to make three or four transfers before the kind of work for which a woman is best fitted is discovered.

It should be emphasized in closing that the Nordyke & Marmon Co. realizes that its experience with women operatives is not sufficiently extensive as yet to permit of the formation of definite conclusions. What has been written here is to be taken as a record of what has been done by the company and a statement of what this experience indicates.

#### Eliminating Blind Spots in Airplanes

Transparent sections in upper and lower wings prevent interruption of vision by structural portions of plane. These are non-breakable glass panels formed to follow the streamline shape of the wings and allow the pilot to look directly overhead and downward on either side of the fuselage

# Technical Details of the Redden Universal Attachment

Designed to Convert Any Passenger Car of the Overslung Type Into a Motor Truck—All Fittings Required Are Universally Adjustable

IN converting a passenger car into a motor truck, there are required an extension of the frame, a new rear axle, and means for transmitting the power from the rear axle of the passenger car to the equipment axle. Reference was made in the news columns of a recent issue of AUTOMOTIVE INDUSTRIES to a new universal attachment placed on the market by the Redden Motor Truck Co. of Chicago, and we are now in position to give some technical details of this attachment.

Fig. 1 illustrates the frame extension. The side members of the passenger car frame extend backward to a cross member of the attachment frame, the rear ends of the former being secured to the latter by means of bolts or rivets. The side members of the Universal Attachment are bent inward at a slight angle, at their forward end, and are secured to the side members of the passenger car frame by means of steel bars which are bolted to the passenger car frame and provisionally secured to the Universal Attachment by means of "U" bolts. These "U" bolts, however, are used only to hold the parts together while they are being drilled for rivets. By moving the attachment frame member farther out along the connecting bar, the frame extension can be fitted to passenger car frames of different widths, thus making the frame extension universal.

Another part of the Redden equipment is a universal axle hanger. This is used to clasp the passenger car axle housing firmly when it is used as a jackshaft. The passenger car

axle housing is not cut off or shortened, nor is its construction changed in any way. A hanger of the type shown is necessary on account of the varying diameters of axle housing and the variety of shapes that have to be taken care of.

Referring to Fig. 2, showing a section through the hanger, it will be seen that the latter comprises a hub made of three parts, one being the hanger proper, and the other two being caps. The inside corrugated face of each part has a larger radius than the outside radius of the axle used. This radius is made such that it will permit of taking in the largest

Fig. 1—Frame extension. A, bolt joining rear end of car frame to cross member of extension; B, extension bar; C, U-bolt

diameter of passenger axle housing in actual use. The axle housing is always clasped at three points as shown. The caps are firmly held to the bracket and each other by means of bolts passing through lugs. On the bracket are two lugs designed to take the forward end of the radius rod. It will be readily seen that by separating the caps an equal distance from the hanger and from each other, a larger size of axle housing can be clamped in place. Herein lies the universal feature of the hanger.

No change is made in the passenger car axle driving shaft, and, in fact, its hub is left intact. It is necessary,

Fig. 3—Attachment of sprocket wheel and brake drum

Fig. 2—Axle hanger

however, to remove the wheel proper with the spokes from the hub and substitute in its place what is known as a spoke replacement flange, as shown at A in Fig. 3. This is clamped in place by means of the hub bolts. It is held firmly by the hub flanges, and in turn supports the jackshaft sprocket flange B. This latter is accurately placed in an axial direction by means of varying thickness of washers C. The jackshaft sprocket flange, by means of attaching bolts, carries the jackshaft sprocket and the service brake drum. All of these members form a compact bellhousing or exterior hub. From this hub the power is transmitted to the rear wheel by means of a driving chain.

It is realized that it will be necessary to fit different types of hub barrels, and some means of universal adaptation must be made. This is taken care of by means of the adjustment bolts DD which force a steel jaw radially against the hub, clamping it at four points, regardless of the diameter.

The three parts described, viz., the frame extension, the axle hanger and the jackshaft sprocket flange housing, are the three main universal parts of the Redden Universal attachment. They permit of fitting the attachment to any make of passenger car, with the exception of the underslung type.

In the design of the Redden trailer an attempt has been

made to reduce the weight to a minimum consistent with reliable service. The same type of axle is used as in the Universal attachment. Each set of wheels, front and rear, carries a sub-frame, and the main frame is attached to the sub-frames by means of a king bolt. Each pair of wheels possesses a fifth wheel, allowing both front and rear axles to turn. The two sub-frames are connected to each other by means of a cross bar arrangement which gives to both the same turning radius. These cross bars are in the form of a turn buckle, permitting of adjustment to insure the proper tracking of front and rear wheels. Very strong spring shackle bolts and spring shackle rods are provided.

The sub-frame is composed of 2½ by 4 in. pressed steel channels, put together with double gusset plates and three cross members. The fifth wheels rest on rollers attached to the sub-frame, making them easy turning.

Wheels are fitted with roller bearings. They are of the artillery type and equipped with S. A. E. Standard solid tires 34 by 3½ in. in size. The drawbar is directly attached to the axle, and the trailer is reversible.

The main frame consists of heavy pressed steel channels, held together by 6 cross members. The entire equipment is capable of carrying a safe load of 4000 lb.

## An Effective Safety Display

A NOVEL way of keeping before the men in the shop the idea of safety is being employed by the Willys-Overland, Inc., Toledo. A large, movable display board is placed in each department alternately in such a position as to be before the men whenever they come to and go from work.

This board, measuring about 7 ft. in height and 5 ft. in width, has mounted upon its black background scores of sample tools—those which have been used so long as to be considered unsafe and should be discarded, and the new tools which should replace them. The hazards with the use of poor tools are many, and it is the aim of this bulletin board to point out to the workers the chances they are taking through the use of tools other than those recommended by the company.

### Use of Each Tool Described

Under each specimen tool is a card either stating what results may follow the use of the tool and recommending the use of another tool, or giving statistical data relative to accidents occurring throughout the factory following the wilful use of such improper tools. The following are interesting excerpts:

*725 days lost because of tools slipping from heads of bolts, nuts, screws, etc.*

*1013 days lost because of flying particles. Wear goggles.*

*87 days lost because of flying chips cutting with simple tools.*

*178 days lost because of ladders slipping.*

*100 days lost due to simple tool accidents of various kinds.*

*328 days lost because of glancing blows from hammers.*

*1068 days lost due to flying objects from glancing blows of hammers.*

*Turn down nails. It is a dangerous practice to allow boards to lie around with the points of nails upturned, ready to pierce some one's foot.*

The board stays in each department about 2 weeks, and it will take about 2 months for it to complete visits to all the factory departments. Another board is being prepared. It will be entirely different. It will have statistics and pictures showing the results that follow failure to report small or minor injuries. The company desires to emphasize the fact to the workmen that

all injuries, no matter how insignificant they may seem, should be reported immediately.

Safety display board which is set up in the various departments of the Willys-Overland Co. to warn operatives against the use of poor tools

# The Problems of Aerial Bombing

Details of Bombs, Bombing and Bomb Carrying—The Difficulties of Aerial Navigation and Night Flying as Set Forth by British Army Experts

**D**URING a recent week the British Royal Flying Forces dropped over 3000 tons of bombs on German cities and fortifications. This is more than was used in any like period previously by any two of the warring countries. Night bombing by airplane is receiving growing recognition as the probable road to victory. Consequently the science of bombing and night flying is receiving much consideration and the problems and activities are given publicity in the effort to secure the utmost efficiency. The following descriptions of the bombs used and the difficulties of night bombing were secured from British officials in this country who speak from personal experiences.

Bombing has been used for war purposes since 1912 when Italy dropped bombs during the Tripoli campaign, but it was not until the present war had been in progress for two years that bombing attained any high degree of perfection. In the first years of the war pilots were frightened when ordered to take up a bomb and did so only under extreme pressure.

Each nation has developed its own types of bombs. The actual shapes differ, but the general idea is similar, being a pear-shaped bomb with wings on the stem end. The wings prevent the bombs from falling heels over head in the air, insure correct aim and explosion when they "strike." The "skin" of the pear, as it is called by the British flying officers, is usually made of steel, which is best, but in some instances is constructed of cast iron. The "flesh" is a high explosive, such as T. N. T. or amatol, or one of their derivatives. The "core" is known as the exploder or detonator. The "stalk" and the remainder of the pear at the bottom are the fuses on which depends the explosion.

## How Bombs Are Used

Bombs are used for two purposes, to attack the enemy troops in the open or under light cover as in billets, and to destroy supply stores, factories, ammunition dumps or cities behind the lines. Small bombs are used for the first. They are about 20 pounds in weight, have a case  $\frac{1}{2}$  inch thick and when exploded burst into thousands of fragments about  $\frac{1}{4}$  inch to  $\frac{1}{2}$  inch square each, which fly out in all directions. Another bomb sometimes used for this work weighs 112 pounds. It is not as efficient. The British forces using the small bomb did remarkable execution against the Germans in the drive in March of this year.

Bombs weighing 230 pounds and 500 pounds are being used for the destruction of cities, factories and supply stores. Larger ones are expected to be developed in the near future as the carrying power of raiding machines increases. The big bombs are also used by flying boats against submarines, and for this work are so made that they explode well under the surface of the sea.

The large bombs used for attacking towns are constructed with thick cases so that heavy fragments of the metal are hurled and create considerable damage. These bombs carry two fuses, a nose fuse and a tail fuse, and can be made to explode by either at the will of the pilot.

The nose fuse bursts the bomb on percussion—at the time it hits the ground or any other hard object. The tail fuse is so arranged that it can be set to explode the bomb not immediately as it strikes, but after it has penetrated some distance. For example, when bombing railroads or a building containing ammunition the pilot desires to have the bomb penetrate before bursting. By exploding after the bomb has penetrated the ground for 4 or 5 feet below the surface of a railroad track it insures a deep crater and more extensive destruction.

## Carrying Bombs on Airplanes

The carrying of the bombs has developed considerably from the early days when the bombs were tied on to an airplane anywhere by means of wire, which was cut at the critical moment with a pair of pliers. Special racks were designed in the first years attached to the bottom of the fuselage or beneath the planes, which made possible the accurate sighting and simplified the release of the bomb. With the development of machines of greater lifting power the bombs were hung up by their noses inside of the planes, from which position they are released automatically as the bomb sight swings over the objective.

Bomb sights are not yet near perfection. The difficulties encountered with them may be explained by comparison of their use with machine gun aiming. The machine gun provides a fixed point from which the pilot shoots at moving objects. But the bomb, moving along as fast as the machine is, must be released before the plane is over the target. This makes the speed of the airplane an important factor. In addition, the speed of the wind is very important and difficult to gauge and further, unless the airplane is flying on an absolutely level keel, the pilot is unable to know what point is vertically below him, and is not certain when he is over the target.

Bombing of cities, factories, supply stores and ammunition dumps is best accomplished at night, because the bombing planes are comparatively slow in flight and by day offer good targets both to anti-aircraft guns and enemy fighting planes.

## The Problems of Aerial Navigation

As a rule when a squadron leaves its aerodrome it circles around until it attains 15,000 feet, which is the usual cruising height. They then proceed at about 30 miles per hour toward the objective, which may be 30 miles distant, and must maintain their course despite darkness, varying winds, clouds, fogs or anti-aircraft barrages. This involves problems of navigation and difficulties of navigation form one of the most serious obstacles to effective night bombing. For comparison consider the navigation of a ship across the ocean at 20 knots with currents of 5 knots carrying the ship off the course. This is an extremely difficult situation, but is simple in contrast to the complications of successfully piloting an airplane at 90 m.p.h. with wind currents at 25 to 30 m.p.h. and varying at different heights.

Navigation by night is considerably more difficult than

## Topographic Records of Bombing Results and Guides for Future Bombing

Graphs like these are used by bombing squadrons, together with maps, to determine objectives. They are the products of the double operation of bombing and reconnaissance.

*It—A bombing raid by one airplane on the Bolchen aerodrome. Three hangars were badly damaged by direct hits and holes were torn in the landing field.*

*Bombing of Thionville, with its railways, railway building and station. The bridge hit is exceptionally good and shows exceedingly good aim.*

navigation by day, chiefly because it is often impossible for the pilot to see the ground. The Germans when raiding London, always choose nights with bright moonlight, when the ground features can be seen in outline. Under the moonlight, woods and forests appear as black patches, rivers and lakes show as silver colored threads or patches. These help, when they are frequent enough, to check the direction of the flight. Otherwise, without the ground features, the pilot has only his compass to direct him, and the compass is not yet perfected.

After considerable study of aerial navigation, from 1911 to the present time, a British naval officer, Captain Creagh Osborne, has developed this division of air flying to a comparatively high degree. The compass is affected by the steel and iron used in the construction of the airplane or in its cargo.

The errors caused by the weight and the metal are termed "deviation" and this is corrected, so far as possible, by specially trained men, with the aid of magnets, prior to the flights. Excellent examples of the difficulties encountered are shown in the fact that when an airplane carries a full load of bombs and the compass is adjusted correctly, the needle becomes incorrect when the bombs are discharged, owing to the iron casings on them. This makes the return trip of a bombing expedition very difficult. Again the deviation caused by the proximity of a machine gun can be corrected but will again be in evidence after the gun has been fired.

The compass, of course, does not show the true or geographic North Pole, but instead points to the magnetic North Pole located in the regions north of Canada. Consequently, the pilot using a map and the true north must estimate the variation and add or subtract the angle between the directions of the true and the magnetic poles in his calculations. This variation changes according to geographical positions and calculation on a long flight of 500 to 1000 miles must be made several times. Thus, before making a long distance flight the pilot takes his true course from the map. He converts this into the magnetic course by estimating and applying the variations, then calculates the wind drift and then applies the deviation. This gives him the direction in which to fly by compass to gain his objective. With all these calculations he must still continue to change his course as the wind changes in strength and direction, and must from time to time check his position by taking observations of visible points on the ground, such as the lights of distant cities. Despite all of these difficulties and obstacles, night raids are being carried on in radii of 200 miles with practically little trouble.

The subject of aerial navigation is being treated seriously in England, which country has gone so far as to establish inland lighthouses similar to coast lighthouses to facilitate training in night navigation.

### Flying Without Landmarks

Besides the above explanations of the navigation problems, which were made by Major H. O. D. Segrave of the British Military Mission in this country, additional details were given by Lt. W. A. Robson of the Royal Air Forces in the following statement. Lt. Robson's remarks further illustrate the problems that must be met and overcome to make night bombing a certain operation.

"The purpose of aerial navigation," said Lt. Robson, "is to enable the airman to find his way in the air; and, in particular, to find his way when he is unable to see the ground.

"Aerial navigation is a science which has been enormously developed during the war; in fact, before the outbreak of hostilities, very little attention had been paid to it; for pre-war cross-country flying was per-

formed under condition in which the pilot always had a view of the ground, so that he relied upon landmarks and a compass to guide him on his way.

"If through untoward circumstances, such as a sudden fog arising, he lost sight of the ground, then he had to find his bearings by guess-work; no provision was made for such an eventuality.

"In those now remote days flying itself was the pre-occupation and the arrival of the aviator at any precise destination was not a matter of first class importance, as it now is. Further, flying was not regularly undertaken at such vast heights and in all weathers—in fog and cloud and mist—as it is to-day; and night raids and long sea patrols were not thought of.

"Finding one's way with the earth in view is a simple matter. All that is required is a compass and a map. A compass course can be flown nowadays with a fair degree of accuracy; and miscalculations can quickly be adjusted by landmarks; for no stretch of country exists which does not furnish its clues to a keen observer.

### The Matter of Drift

"It is when flying has to be carried out without the ground in view that difficulties arise. Chief among these is the question of drift. If a machine is to fly from a given point to a town 60 miles east, and there is a steady wind blowing 20 miles an hour northeast, it is a simple matter to allow for drift and calculate the direction of the compass course which the pilot must steer. But the direction and velocity of the wind may change considerably during the journey.

"If the ground is visible the distance the aircraft is drifting out of its course owing to change of wind can be judged either by the eye or by means of a simple instrument. This instrument consists of a flat calibrated glass disc marked with thin parallel lines. The disc is turned so that these lines are parallel with the direction of flight. Objects in the direct line of flight are observed as they appear beneath the glass disc; and the drift is easily determined. But obviously no such instrument can be used when the ground is not visible to the airman.

"Meteorology frequently enables the pilot to deal successfully with such situations by rule of thumb; and every British flying officer undergoes a meteorological course as part of his training.

"Another difficulty which besets the airman navigating without assistance from below is the question of speed. An air speed indicator records the rate at which he is rushing through the air; and that, indeed, is the vital fact so far as the stability of his machine is concerned. But it does not tell him how fast he is traveling in relation to the ground. For while his air speed may be 120 miles per hour, his ground speed will be only 80 miles per hour, if he is flying in the face of a 40 mile wind. An anemometer will tell him the speed and direction of the wind at the time of leaving his aerodrome. But, as previously stated, the velocity of the wind frequently changes; and of these changes he has no certain knowledge.

"Earlier in the war, night-flying was far more dangerous than it now is, on account of the difficulties connected with aerial navigation at night. Enormous progress has been made in this direction by the Royal Air Force both in regard to the Home Defense work in England and the work performed by the Night Bombing Squadrons in France. The former is clearly evident from the manner in which the German craft which have frequently attempted raids on England during the last 9 months have again and again been effectively repulsed, often with heavy losses.

# Machine Forging in Automotive Plants

Methods Employed in the Production of Upset or Annular Forgings—Absence of Waste in Materials and the Elimination of Machining Operations Important Advantages

**T**HERE are many steel parts in automobiles, motor trucks, tractors, etc., which are made from bar stock but require enlargement beyond the section of the original bar. Also, parts of annular form are made from bars of much smaller diameter. These operations are performed in a forging machine which is primarily a hammer, but which also acts as a punch.

Perhaps the most common upsetting job is that required for forming the flywheel flange on a crankshaft, as practically every portable engine employs this method of flywheel fixing. There are, however, numerous other parts in motor trucks, tractors, etc., that can be advantageously made in the forging machine. For instance, clutch shafts and transmission shafts are sometimes formed with flanges to which the clutch drum or cone and the gear wheels are secured respectively. Bevel pinions are forged directly onto the shafts by merely upsetting the ends; worms are similarly forged integral with their shafts. Rear axle shafts are upset at the ends so that the keying, squaring or fluting for the joint with the differential gear and wheel hub will not reduce the strength of the end below that of the major portion of the shaft. In so-called three-quarter floating axles large disks are even forged on the ends of the shafts to secure the shaft rigidly to the wheel. Of the smaller parts of the automobile and motor truck that are formed in the forging machine may be mentioned spring bolts with integral grease cups and races for ball and roller bearings.

Designers of automobiles, tractors, etc., often are not as familiar with this class of work as they should be, and some information on the subject, based upon a recent publication of the National Machinery Co., Tiffin, O., may be of assistance.

The forging machine consists essentially of a very substantial bed or frame with guides for two slides, the grip slide which grips the bar stock, and the heading slide. The heading slide is operated through a crank and connecting rod. The bar stock, after the end to be upset has been heated, is gripped in the gripping die which is made in halves and provided with a quick-acting opening mechanism. Practically every job has to undergo a number of successive operations, and the gripping die has a number of parallel openings or impressions equal to the number of operations and the header slide an equal number of headers.

## Forging a Spring Bolt with Grease Cup

A rather simple forging machine job is that of forging a spring bolt with integral grease cup. Formerly these bolts were made from bar stock equal in diameter to the maximum diameter of the head or grease cup, in automatic lathes, but the upsetting process economizes both stock and labor. The waste of stock is the more important because high grade material, such as nickel steel, is generally used for these pins. When made in automatics, with many designs, more material needs to be cut away than remains in the finished bolt, and the amount of labor wasted is quite large. By the upsetting process the bolts are made from stock about 0.020 in. larger in diameter than the finished shank of the bolt. The bolt forging illustrated herewith is made from 13/16 in. diameter stock in a forging or heading machine, whereas formerly it was made from 1 3/8-in. stock in an automatic. The present process involves two operations. In the first operation a flange is formed on the end of the bar, equal in diameter to the largest diameter of the cup. In the second operation this flange is pierced and the metal behind the flange is expanded to form the cup. As a rule, these spring bolts are made from blanks previously cut to length, and the material is heated before being placed in the machine, so that the upsetting will cause no crystallization and resulting weakness. The bolts can be made

Above: Dies and heading tools for forging spring bolt. On right: Spring bolt. Below: Dies and headers for bearing race

*Dies and tools used in forging axle shaft with driving flange**Steps in the manufacture of a wheel hub forging**Dies and headers used for forging gear blank*

of stock so close to the finished shank size that no machining is required, the shank being reduced to the finished dimension by grinding.

Roller bearing races also form a comparatively easy job for the forging machine. The race herewith illustrated is the outer one of the bearing,  $3\frac{3}{4}$  inches in outside diameter, and it is made from open-hearth steel bar stock  $2\frac{1}{2}$  inches in diameter. There is no waste of material in the process; that is, all of the metal in the bar goes into the forgings, with the exception of the last end of the bar.

### Gripping Dies

It will be seen that the gripping dies have three impressions, and the process involves three operations. For the first operation the bar is gripped in the top step of the dies. It will be seen that this step is made with threads or corrugations, as it has to hold the bar firmly against the pressure of the header. In the other steps this is not necessary because the pressure on the work is then transferred to the gripping die through the shoulder or shoulders of the upset.

In this particular operation only a moderate gather of material is required, which is easily effected in a single stroke of the header. In the design of the dies it is necessary to closely calculate the amount of gather required, and the dies must be set accordingly. It is interesting to know that the length of the bar projecting from the gripping portion of the gripping die must not be greater than three diameters, if the projecting part is unsupported, as otherwise it will buckle and upset unevenly. Therefore, if more gather than this is required, several successive upsetting operations are ordinarily necessary.

In the next operation in forming the race, the tapering race surface is formed, and in the final operation the race is "given another squeeze" and is separated from the bar by being punched through. For this last operation the race or upset on the bar is gripped in an annular impression in the gripping die, so that the punch may be withdrawn from the race after the latter has been separated from the bar.

Forging these race blanks is not an unusual job, except for the high degree of accuracy called for. No machine work is done on the races; they are finished by grinding only, and to make this practicable a limit of 0.020 in. was set on the finish. It is stated that this limit is not only adhered to, but the majority of the rings show variations of less than 0.010 in.

A most interesting part made on the forging machine is the rear axle shaft with integral driving flange as illustrated. This is made from  $1\frac{3}{8}$ -in. chrome nickel steel stock, and the finished blank has a diameter of 5 in. The amount of material in the hub flange is equivalent to a length of  $10\frac{7}{8}$  in. of the  $1\frac{3}{8}$ -in. diameter bar stock. In gathering such a large amount of stock, care must be exercised to secure a forging free from seams or cold-shuts. Practice has shown it to be advisable to make this forging in a four step die.

It was pointed out above that if an attempt were made to upset an unsupported length of bar stock of more than three diameters, the stock would buckle and thus spoil the work. In order to obviate this trouble, the projecting length of the bar must be guided in some way, so that it cannot buckle more than a certain amount. Also, where a large amount of gather is required, successive upsetting steps are necessary. In these successive steps it has been found advantageous to use alternate square and round guides.

### Upsetting Stock Pockets

The first upset is in a square pocket in the grip die. This pocket is slightly larger across the flat than the diameter of the stock, thus guiding the stock in upsetting and preventing buckling. The second and third upsettings are in round pockets in the grip die, and these operations are performed at the same heating. Before the final operation is begun, the stock is reheated. One of the reasons for this is that the final operation is rather intricate, the recess on the inside of the flange being formed at this time. In order to make it possible to readily withdraw the finished blank from the die, the left half of the die is hinged, so that after the recess has been formed and the grip has opened, the movable half

the die automatically backs out by virtue of its hinged swinging action. The forging remains in the stationary die, and is lifted out by the operator. While it is possible to make forgings of this type in three steps, rigid inspection is maintained, it is advisable to use a four step die, as the rejections will then be fewer in number.

Another interesting part made in the forging machine is a motor truck wheel hub as pictured in one of the illustrations. This is made in three operations, in a three step die.

### The First Operation

The first upset operation is illustrated at the right. The center portion of the hub is here upset and the flange started. In the next operation the flange is upset to full diameter, and a piercer of the heading tool partly pierces the hub. On the third and final operation the hub is punched, and freed from the bar, the steel punched remaining on the end of the bar, thus preventing waste. In making this hub forging, bar stock of  $2\frac{5}{8}$  in. diameter is used, and the flange is upset to  $8\frac{1}{4}$  in. diameter and  $\frac{1}{2}$  in. thickness.

In the manufacture of gear blanks of chrome nickel and similar alloy steels, economy in material is of the greatest importance at the present time. Where small quantities are involved, the blanks in the past have sometimes been cut directly from the bar, and in other cases they are forged in the drop hammer. In both cases there is a waste of material in the first due to the machining, and in the second because of the tongue hold and flash. In the forging machine such blanks may be produced absolutely without waste. The gear blank illustrated at the right, which is of more than ordinarily complicated form, can be forged in three operations. In the bottom

groove of the die the stock is gathered into a cylindrical upset, which in turn is raised to the middle groove of the die, where the gear blank is formed to the final dimensions. In the top step of the die, the punch pierces the hole and detaches the gear from the bar.

In order to prevent buckling when large amounts of stock have to be gathered, guides can be formed either in the gripping die or in the header. For instance, the limit of length of unsupported stock which can be gathered or upset in one blow without injurious buckling is three diameters of the bar, but if the stock is gathered in a pocket in the gripping die not more than one and one-half times the diameter of the bar, then the length upset in one blow may be somewhat greater.

Where large amounts of stock have to be gathered it is usual to form a pocket in the end of the gripping die of about 1.3 times the diameter of the bar. In the next operation the diameter of the pocket can be 1.7 times that of the bar and so on. A still better plan is to make the first pocket of square section, with the sides only a little wider than the diameter of the bar. Then there is very little chance for the bar to buckle while being upset, yet there is considerable space in the corners of the square for the metal to gather in. The next pocket would be made round, of a diameter a little larger than the length of the diagonal of the square across the corners.

### Special Forms of Stock Gathering Pockets

The whole aim in the design of dies is to reduce the number of operations required to produce the finished forging to the smallest possible number consistent with the accuracy and the quality of material demanded. The more stock that can be gathered in a single blow the fewer, generally will be the operations required. When the bar protrudes from the gripping die too far, it tends to buckle, and the buckling is most pronounced, naturally, at the middle of the protruding portion. Therefore, at this point the guide must come close to the bar. Therefore, if a large amount of stock is to be gathered in a single blow, the pocket in the gripping die is made cylindrical at the outer end for a little more than one-half its length, and the remaining portion of the pocket is cone-shaped, the diameter being gradually increased. The bar is gripped in the die so that its end projects slightly beyond the end thereof, and when buckling occurs it is soon stopped by the wall of the pocket. The heading tool is of such diameter that it enters the end of the pocket in the gripping die. Owing to the friction between the die and the bar after the latter has come in contact with the wall of the pocket through buckling, the outward end of the bar will upset first, the stock will gradually carry back in the die and a uniform frustrum-shaped upset will be produced.

### The Happy Farmer Tractor

THROUGH the kindness of the La Crosse Tractor Co., La Crosse, Wis., we are now able to give further information regarding one feature of the Happy Farmer tractor which was not brought out with due prominence in the descriptive article which appeared in the July 18 issue of AUTOMOTIVE INDUSTRIES.

The use of a patented device in the bottom of the crank-case makes it impossible for the small amount of kerosene which may work past the piston rings and thus mix with the lubricating oil to reach the bearings.

As was pointed out in the descriptive article, the crank-case is drained automatically, the oil being conducted to the transmission and differential gear cases and thence to the outer roller pinions and bull wheels.

## Problems of Gear Standardization

By B. F. Waterman

*Chairman, General Standardization Committee, American Gear Manufacturers' Association*

IN the May 30 issue of AUTOMOTIVE INDUSTRIES, on page 1053, appears an article under the above title which sounds a note which I am sure is foreign to the purposes of the American Gear Manufacturers' Association. After stating that "such standardization presents great opportunities for both good and evil," the writer goes on to say that "from the point of the gear manufacturers good only can result, but there may be danger to those whose interests lie in the search of mechanical efficiency or the development of new and improved methods of transmitting power."

It is this fear that standards may be adopted that will tend to discourage improvements in gear design that is unwarranted.

It may be stated here that any attempt to limit improvements in the design of gears or their application, or any standard having this effect, would be fatal to the success of any gear manufacturer who attempted to impose it upon his customers.

Most of the members of the American Gear Manufacturers' Association are just what their name implies—"manufacturers of gears"—and use but very few themselves, most of their products being made to customers' specifications.

In the report of the "General Standardization Committee" read at the last annual meeting the intentions of the association were clearly set forth as follows: "This association has considered it advisable, for the advancement of the gear industry, to appoint as one of its standing committees a General Standardization Committee, to consider and develop from the mass of data which now exists in various forms, standards for use in this industry, and which will be of value to all who may have to do with gears, either as manufacturers or as users."

It was stated further that "what we produce must fill certain standards of quality. What these are must be determined by ourselves and the users of the gears. It would be folly for us to set standards of quality if they do not fit the conditions of use to which the gears will be put, and there will always be conditions that any standard we make will not fit."

Also, at this meeting a resolution was adopted as follows: "Recognizing the desirability of co-operation in order to prevent conflict and the putting of more than one standard before the public, the American Gear Manufacturers' Association is willing and anxious to co-operate with other organ-

izations interested in the standardization of apparatus where gears are used and in the betterment of conditions in the industries which may use gears."

Surely this speaks well for our intentions, and users of gears need not fear that the standardization of gears will retard, in the least, any new improvements in the growing field of gear transmission.

The other points in this article are well taken, except an expression in the last paragraph, as follows: "His (the user's) interest is in one phase opposed to that of the maker." This cannot be so any more than in any other line of manufacture. The user's interests and the manufacturer's are the same, and those manufacturers who realize this the most vividly will enjoy the greatest success. Ease of manufacture and increased production in no way affect the issue. It is true that the standards that may be adopted will make the manufacture of gears easier to accomplish, but there can be no increased production unless we please our customers.

In this letter it has been the writer's endeavor to impress those who are interested in gears and their standardization that the American Gear Manufacturers' Association's object is to advance the gear manufacturing industry and the use of gears to a point where everyone having to do with gears will be able to obtain those best suited for any purpose, either from the manufacturers of them or, if they see fit, to make them themselves from the same standards.

## Throttle-Controlled vs. Constant-Compression Engines

By P. S. Tice

WITHOUT the least desire or intent to decry the endeavors of those in this country who are engaged in efforts to design and produce engines for automotive purposes along the lines discussed by Mr. Sargent in the June 27 issue of AUTOMOTIVE INDUSTRIES, I feel that Mr. Sargent in that article has done the throttle-controlled engine a grave injustice in the economy figures he has assigned to it as characteristic.

Mr. Sargent's values for the fuel consumptions in this type engine, as given in his Fig. 1; are so excessively high as to make one wonder when and under what conditions of adjustment they were obtained. Such values can be obtained, of course; but they are by no means characteristic of modern practice.

It seems to me that in comparisons of this nature such figures as are published to point the comparison should be of the same order of practice, and not, as in Mr. Sargent's paper, a side-by-side presentation of an extremely good curve

Fig. 1—Fuel consumption and horsepower curves

Fig. 2—Fuel consumption as related to load

from a "constant compression" engine and an almost impossibly inferior one from a "throttled" engine.

Referring to the two curve sheets attached, Fig. 1 shows corresponding fuel consumption and horsepower curves from a small four-cylinder automobile motor, for the two conditions of open throttle and part throttle necessary to drive the car on a level cement road.

It will be seen that the maximum fuel consumption occurs at idling, when the throttling is greatest. In Fig. 2, I have plotted reproductions of Mr. Sargent's two curves, and with them to his co-ordinates the part load consumptions of Fig. 1.

While for all loads except the extremely small ones Mr. Sargent's curve for the "constant compression" engine is superior, the really enormous discrepancy between the "throttled" curve which I have drawn in and that offered by Mr. Sargent is at once apparent.

The curve marked "Tice-throttled" is I believe representative of our best modern practice in throttle-controlled engine performance.

## The Engine for the Fuel of To-morrow

By W. L. Dempsey

THE four-cycle gas engine made the automotive industry and 70 deg. gasoline made the four-cycle engine. We still have the four-stroke engine, but 70 deg. gasoline is a memory, and in a few years more it will be history.

Let it never be forgotten that the four-cycle engine is an explosive engine depending always on a dry gas for its power, and that the dryness of a charge varies directly in proportion to the heat applied at standard pressure. It may also be stated that the thermal and mechanical efficiency of a four-cycle engine is in direct proportion to the dryness of a proper charge.

The enormously increasing demand for hydro-carbon fuel caused by a like increase in the manufacture and use of the four-cycle engine for pleasure cars, motor trucks, tractors and aeroplanes has compelled the refiners of crude oil to introduce methods of distillation such as the Burton, Rittman, Dewey and others that require average maximum temperatures of from 500 to 600 deg. Fahr. or even higher.

Since practically all engines are water cooled, the high temperatures necessary to fully gasify the fuel are seldom obtained, so that a large proportion of the fuel is not only wasted, but seriously affects the operation of the engine, by carbon deposits, oil dilution, etc. Since water can absorb and retain not more than 212 deg. Fahr. of heat, a water jacketed carburetor serves only to vaporize the lighter part of the fuel, while the heavier part, that part which requires more than 212 deg. of heat to gasify, is either drawn into the cylinder in a raw state or remains accumulating in the carburetor. It seems to the author that the carburetor manufacturers could greatly improve their product by providing means for the application of heat to both the air and fuel sufficient to maintain uniform temperatures at all speeds of 400 to 600 deg. Fahr.

Any liquid hydro-carbon fuel of whatever density or volatility may be economically and successfully used as a motor fuel in a four-cycle engine of variable speeds provided sufficient heat is applied to transform it into a dry gas and provided sufficient air is furnished to insure complete combustion of the fuel. The dividing lines between gasoline, naphtha and kerosene are just about as definite, distinct and visible as are the outlines of a camouflaged ship far out at sea. The only accurate and exact way to define the quality and volatility of a hydro-carbon liquid fuel seems to be to give the minimum and maximum degrees of heat at which it was distilled. The gasoline of to-day was kerosene yesterday and will possibly be petroleum ether to-morrow.

The automotive industry will live, it will grow and thrive, but the heart of the industry is the engine and it is sorely afflicted. The fuel situation has changed radically and fundamentally, and the engine must change with the fuel to save the industry. It will be a four-stroke engine no doubt, but changed how? Will it be a four-cycle dry gas explosive en-

gine or will it be a four-stroke or two-stroke slow burning constant speed oil engine? That is the question. That it must change and be improved to adapt it to the fuel available all will admit, but how? There is the rub.

The writer believes that the motor of to-morrow will be a four-stroke variable speed dry gas explosive motor capable of successfully using a liquid hydro-carbon fuel of any degree of density down to perhaps 30 deg. Baume, and distilled at a maximum temperature of 700 deg. Fahr. such an engine must provide means for:

First—The complete gasification of the fuel by the application of an amount of heat greater than that at which the fuel was originally distilled.

Second—Means for surcharging the cylinder at the end of the charging stroke with an amount of oxygen equal to or greater than that which is dissipated in the act of gasification.

Third—Means for the retardation of the rise in temperature due to compression sufficiently to obtain efficient compression pressures, by the introduction of cooling elements into the cylinder at the beginning of the compression stroke.

Fourth—Means for the equalization of the temperature of the piston and cylinder walls so that a proper clearance between them may be maintained at all temperatures without danger of seizing or looseness.

Fifth—Means for the complete expulsion from the cylinder of all the products of combustion which would result in lower internal temperature and thereby increasing the temperature range.

## Tanning by Means of Chromium Salts

PREVIOUS to the war, tanning by means of chromium salts was an industry almost exclusively American and German. The Central Empires, particularly, had monopolized the important market of British India. Chrome leather is used largely in the industries, in automobile work for clutch facings and universal joints.

The British Government recently had the chrome tanning situation looked into with the intention of introducing the process either in England or Hindustan, and *The Board of Trade Journal* of May 9 gives some details regarding the processes of chrome tanning and the history of their development. The action of the basic chromium salts is due to their property of furnishing colloidal solutions which are slowly absorbed by the skins, the fibres of which are separated and modified in their chemical composition in such a way as to obviate any swelling due to the action of water.

As far back as 1858 Knapp described a process making use of a mixture of alum, chromium and carbonate of soda; this method of operation has remained in use to this day under the name of the single bath process. In the United States, August Schultz in 1884 introduced the double bath process. The skins are impregnated with a solution of bichromate of potash, acidified by means of hydrochloric acid. Then the chromic acid absorbed by them is reduced by means of sulphurous acid obtained by immersion in an acid solution of sodium hyposulphite. It is probable that in this second operation the chromic acid forms with the hyposulphite a colloidal compound of the formula  $\text{Cr}_2\text{O}_3$ ,  $\text{CO}_2$ ,  $\text{H}_2\text{O}$  and tetra thionate of soda,  $\text{Na}_2\text{S}_4\text{O}_6$ . This reaction is indicated by the brown color which the skins assume. This color later becomes lighter and gives way to a bluish tint, probably due to the action of the hydrochloric acid, with the production of the chromium chlorate and precipitation of colloidal sulphur. The incorporation of free sulphur in the latter makes it more supple and gives it a better color than is obtainable with the single bath process. The latter nevertheless is preferred on account of its easier application.

The advantages of tanning with chromium salts are as follows: The time required for the operation is shorter and the capacity of production of tanneries is therefore increased. It furnishes impermeable dense leathers which are very much in demand for box calf and chevreaux glace. Their tenacity makes them especially applicable to certain uses. On the other hand, the property of chrome salts to form lacquers with certain pigments renders the process particularly interesting for the production of colored leathers.

## HORSELESS AGE SUBSCRIBERS

Subscriptions for the Horseless Age transferred to the subscription list of AUTOMOTIVE INDUSTRIES in the merging of the two publications will be completed in full by the weekly issues of AUTOMOTIVE INDUSTRIES to the dates of expiration shown on the records of the Horseless Age Co.

Owned by United Publishers Corporation, Address 243 West 39th St., New York; H. M. Swetland, President; Charles G. Phillips, Vice-President; W. H. Taylor, Treasurer; A. C. Pearson, Secretary.

Entered as second-class matter Jan. 2, 1903, at the post-office at New York, New York, under the Act of March 3, 1879.

Member of the Audit Bureau of Circulations.

Automotive Industries-The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

## Do We Want to Sell Cars in Australia?

AUSTRALIA is and has been for many years one of the best customers of the American automobile industry. Even during these times of shipping shortage and output curtailment, she has bought a relatively large number of our cars. During the twelve months ending with June 30, 1918, 4307 cars valued at \$3,410,557 were sent on the long journey to this distant antipodal continent. Under more favorable shipping and production conditions, her purchases would have been much larger.

Australians buy our cars not because they like us, but because, through our quantity production methods made possible primarily by the great size of our own country, with the resulting huge home demand, we have been able to sell them cars which do exceedingly well what they expect them to do, at prices, including duty and shipping charges, which are less than those charged there for the cars made in other countries.

We do not mean to say that American cars have sold in Australia merely on a price basis, for this is not true. But it can be said without departing from facts that it has been a matter in which price has governed to a considerable extent, and quality in a smaller amount. We should be curtailing our powers of observation to a self-injuring degree if we did not make note of the fact that when the Australian wants to spend money for something he thinks extra fine in the motor car line he buys a British car and pays a higher price for it.

Up to now we haven't minded this very much because bulk sales have been somewhat in our favor, but, after the war, conditions will be different and if American manufacturers are to retain their hold on the Australian market they must alter their selling methods and begin right now whether they have cars to ship or not.

There are two factors which will sooner or later affect the Australian market unfavorably from the American makers' point of view. One of these factors will become effective almost as soon as the war stops, but the other will develop more slowly and develop to an extent dependent very largely upon what we do.

British manufacturers who made motor cars before the war on what, to our way of thinking, was a limited scale, have built great plants and developed huge organizations since the war began. We referred to one case in AUTOMOTIVE INDUSTRIES about a week ago. With a pre-war payroll of some 2500 names, what was then a large British car manufacturing concern now has more than 20,000 employees and a plant that has grown in proportion. What is that concern to do after the war?

There is a new conception of quantity production among British manufacturers and they have the facilities for tremendous outputs. Is it reasonable to suppose that they will stand by serenely and watch some one else pocket the profits from a huge export business in low and moderate priced cars? Isn't it safe to assume and wise foresight to conclude that the American car will have to face much keener competition in Australia and elsewhere, after the war? We know that our product has quality and are not afraid of competitors, but if we do not begin now to go after our Australian trade harder than we ever went after it before, we shall find when the war is over that someone has beaten us to it, as it were.

The other thing we must keep in mind with regard to our Australian trade is that during this period of relative inaction on that continent when nothing very much leaves there and no more arrives, when planters are considering whether they should plant less wheat and other food products on account of the inability to ship what they have already raised, the thoughts of the people have been turned away from agriculture to an extent, to the possibilities of industry. Manufacturing is being taken up as never before. Mines are developing and steel mills are being built. Some day there may be, probably will be, an Australian motor car industry. How rapidly it grows and how large it eventually becomes will depend upon how well we persuade the Australians that we can fill their motor car needs.

## Killing the Goose

By David Beecroft

**K**NOCKING is not dead yet. Last week there was a tractor demonstration in New York State at which over 5000 farmers attended to watch ten tractors plow. Each tractor maker was given 15 minutes to put forth the special merits of his tractor to the crowd.

Eight of the ten tractor representatives took occasion to knock the other makes. Only two makers told a clean story, a tractor merchandising story.

The psychological effect of the knocking on the farmers was most apparent. Scarcely had some of these factory representatives stopped their knocking oration than farmers gave evidence of the uncertainty in their minds regarding tractors in general.

One tractor maker's representative took occasion to knock the creeper type. He failed to realize that those 5000 farmers were all capable of judging for themselves. He failed to realize that his job is not against the creeper type, but against the horse. Others knocked ignition systems and general designs.

It will be too bad if the farm tractor makers fall into this old pitfall. The work of the tractor maker is converting the farm from the horse-pace that has been controlled by generations, in fact centuries, and bringing it up to the tractor-pace, which is a matter of a few years. The big job is getting all phases of farm activities onto the tractor-pace basis.

All forms of farm machinery must be brought up to the tractor standard. This must be done in regard to the grade of metals used, in regard to the accuracy of workmanship, and in regard to the general superiority of design.

With all of these problems facing them the tractor makers have no time to knock. They have no time to try to split the industry into two divisions, creeper types on one side and wheeled types on the other side, or any other divisions. If they want to argue the relative merits of these designs let them do so in their organization meetings; they should not talk this to the consumer.

Tractor makers must educate the farmer to the many problems of the tractor. They must educate him to standards of higher efficiency. They must educate him to give more attention to his machinery. They must educate him to a fuller knowledge of the mechanics of tractors. They must educate him in the principles of increased capacity for work through improved machinery.

The work to-day is for the tractor industry to present a united front to the farmer. It is a pernicious policy to knock and cloud the farmer's mind. That knocking directs the farmer's attention from the biggest problem ahead, namely, greater working capacity and greater acre productiveness through tractor cultivation.

Why get on a house top to proclaim to the farmer the imaginary weaknesses of your competitor's machine?

In your effort to kill a sale for a competitor's machine you are taking the surest course to kill a sale for your own machine.

Knocking is as old as the human race and gives promise of continuing as long as the race continues. Knocking reminds you of the biblical phrase: "We spend our years as a tale that is told." We are continuing to do the things that have been done in the past and which should not be repeated.

The farmer attending his first tractor demonstration approaches the tractor as if it were a blank sheet, or a clean sheet of paper. He has no criticism chalked up against it. He wants to see it perform and then he will chalk up good or bad marks against it as necessary. Why then should the representative of the tractor maker start off by his knocking program to literally fill up with black marks this clean sheet that the farmer has on the tractor? It will normally fill up soon enough, but the tractor maker's representative is not content with such speed; he literally wants to fill it in advance, and indirectly is doing his best to kill sales—to kill the goose that lays the golden eggs.

## Airplane Program Mercilessly Criticized

**Senate Report Condemns All Past Activities—Blames Personnel of Board—Liberty Engine Program Responsible for Delay—Too Many Favors Given Dayton and Detroit—Recommends Creation of Ministry of Aeronautics**

WASHINGTON, Aug. 26—The creation of a Ministry of Aeronautics, with a single head as Secretary of Aeronautics, is the recommendation of the Senate Military Affairs Committee in its long-expected report, issued to-day. The report condemns all of the past activities of the Aircraft Production Board, although it admits the difficulty encountered in aircraft production during the past year.

In summarizing the report states that on April 6, 1917, we entered the war, and on June 8, 1917, an announcement was made that a fleet of 25,000 airplanes was to be created.

On July 24, 1917, \$640,000,000 was appropriated to carry out the aircraft program, which fund has been exhausted either by actual expenditure or commitments.

A further appropriation of \$884,304,758 has been found necessary.

In the opinion of the committee a substantial part of the first appropriation was practically wasted. While much good work has been accomplished, for which the committee states due credit should be given, it must be admitted that our airplane program up to the present presented many aspects of failure. While an army of 3,500,000 men has been made, the aircraft situation is as follows:

Up to Aug. 1, 601 De Haviland 4 observation airplanes have been embarked for France, of which number sixty-seven reached the front by July 1.

On Aug. 7 a squad of eighteen De Haviland 4's flew over the German lines, but the details of their performances have not been received.

We have not a single American made chasse or fighting plane upon the battlefield.

We have not a single American heavy bombing plane on the battlefield.

We have not developed and put in quantity production a successful chasse or fighting plane.

Our attempt to create a fighting plane was centered in an effort to adopt the Bristol fighter and the De Haviland 4 to the Liberty engine. The Bristol was put into quantity production without sufficient test and over \$6,500,000 was expended and the lives of several men sacrificed when the machine was condemned and its manufacture discontinued.

After more than 1200 standard J training planes equipped with a Hall-Scott engine had been manufactured, at a cost of \$6,000,000, the machine was condemned as dangerous and placed in storage.

An oral order was given the Curtiss Aircraft Corp. for 3000 Spad machines. Early in December, 1917, and later in the same month, Col. Clarke and Major Jesse G. Vincent found that the machine could not be operated with a Liberty engine. On Oct. 8 of the same year the contract was cancelled, the reason given being that the single-seater fighter was obsolete; but, states the committee, on April, 23, 1918, contract was let to the Curtiss company to build 1000 S E 5, the English equivalent of the Spad. The cancellation of the Spad contract and the failure of the Bristol left us without a single- or two-seated fighter except the De Haviland 4 which we are equipping for reconnoitering, although it was originally designed as a fighter.

As early as October, 1917, we were in possession of the facilities for construction of the Caproni planes. Expert Italian engineers have been here since June, 1918, but we have up-to-date constructed only one Caproni plane. Nearly a year has elapsed since we might have begun work on these machines and by this time should have been in quantity production.

The Handley-Page bombing plane is another example of our delay. Plans were furnished the Signal Corps as early as the summer of 1917 and contracts were being made until February, 1918. Delivery on these was not begun until August, 1918. The first Handley-Page

plane was flown last July. Tests on it are not yet complete.

Three causes have been pointed out by the committee as being chiefly responsible for the disappointing results up-to-date, as follows:

1—That the airplane program is largely placed in the control of the great automobile and other manufacturers who are ignorant of aeronautic problems.

2—These manufacturers undertook the impossible task of creating an engine which could be adapted to all classes of flying craft. It is not too much to say that our airplane program has been largely subordinated to the Liberty engine.

3—We failed at the beginning of the war to adopt a commonsense course of reproducing the most approved type of European machines in as great numbers as possible. This should have been carried on co-incident with the production of the Liberty engine. This sound policy has only recently been adopted after a lamentable lapse of time.

The committee states this brief summary is not a wholesale condemnation of our airplane program. Much has been accomplished. The committee is glad to report that while it believes there are many things to be remedied, nevertheless, we are approaching a period when quantity production of planes may be hoped for.

The report condemns the construction of the McCook Field at Dayton, Ohio, as

(Continued on page 346)

### Motorcycle Men to Economize

WASHINGTON, Aug. 21—Representatives of the motorcycle industry conferred to-day with the Conservation Division of the War Industries Board relative to a program to effect economies in the use of metals and rubber in the manufacture of motorcycles. The manufacturers agreed to work out technical problems with a view to effecting such

# Automotive Industries

economies and to report within a few weeks through a War Service Committee which is to be organized by the motorcycle industry.

The industry consumes considerable steel, copper tubing, brass tubing, tin plate and rubber and it is now asked to suggest means for the use of substitutes for the metals, particularly copper and brass, which are needed in the war program. The representatives agreed to give the matter close consideration and to make suggestions to the Conservation Division which will form a basis for recommendations by the latter.

The motorcycle industry was represented at the meeting to-day by T. C. Butler, Jr., C. B. Franklin and F. J. Weschler of Springfield, Mass.; F. B. Rodgers, Arthur Davidson, W. S. Marley and August Frey, Milwaukee and A. G. Hale and F. J. Stareck, Cleveland.

## Homes for Shipbuilders to be Erected

WYANDOTTE, MICH., Aug. 20—Two hundred houses for ship builders will be erected in Wyandotte by the United States shipping board.

## Ford Passenger Car Prices Advanced

Touring Car Costs \$75 More and Truck Is Reduced \$50

DETROIT, Aug. 19—The Ford Motor Co. has advanced the prices of its passenger car models, varying from \$65 to \$90, effective Aug. 16. The touring car has been increased \$75; roadster, \$65; coupelet, \$90; sedan, \$80; chassis, \$75. Simultaneous with the announcement of these increases, a reduction of \$50 was made in the price of the truck, which came as a surprise to the trade and upon which the company declined to comment.

On June 10 the company had bona fide unfilled orders on its books for 110,607 cars, divided as follows: Touring cars, 89,242; roadsters, 9824; coupelets, 3013; sedans, 1675; trucks, 5234; chassis, 1619. The company now has unfilled orders approximating 112,000, 85 per cent of which is passenger cars. Present and former prices of Ford cars are shown below.

The Ford Motor Co. of Canada has also increased its passenger car prices, effective Aug. 16, from \$85 to \$105. The price of the truck remains the same, \$750. Prices follow:

Model	Old Price	New Price	Increase
Touring	\$585	\$660	\$75
Roadster	555	620	65
Coupelet	770	860	90
Sedan	970	1,055	85
Chassis	535	610	75

Prices are all exclusive war taxes.

Model	Aug. 16, 1918	Aug. 1, 1917	Aug. 1, 1916	Aug. 1, 1915	Aug. 1, 1914	Aug. 1, 1913	Aug. 1, 1912
Touring	\$525	\$360	\$360	\$440	\$490	\$550	\$600
Roadster	550	345	345	390	440	500	525
Coupelet	650	505	505	590	750	...	...
Sedan	775	645	640	740	975	...	...
Town car	Discont'd	Discont'd	595	640	690	740	...
Truck	550	600	...	...	...	...	...
Chassis	475	325	325	360	Not Sold	Not Sold	Not Sold

An American-Built Caproni  
Biplane, Equipped with  
Liberty Engine

Italian officials state that the Caproni is considerably improved by the use of the Liberty engine instead of the engine used in Italy, as it provides about 60 hp. additional

The Liberty engine used is of the Seaplane type, developing about 360 hp. It is of similar design to the military type but develops about 90 hp. less. Major General William L. Kenly, Chief of the Department of Military Aeronautics, U. S. Army, is seated in the machine shown in the large photograph

## Ford Production Is 700,000

85,000 Below the Total for 1917  
—Over 100,000 Unfiled Orders  
—Assembly Plants Shut Down

DETROIT, Aug. 14—During the fiscal year ending July 31 the production of the Ford Motor Co. totaled approximately 700,000 cars, as compared with a total of 785,000 during last year. It is understood that on June 10 there were unfiled orders for 110,607 cars on the books.

The assembly of cars at the company's branches at Washington, Denver, Houston, Los Angeles, Buffalo and Oklahoma City has been discontinued, and the Government has taken over the assembling plants in Philadelphia; Cambridge, Mass.; St. Louis; Pittsburgh; Seattle; Portland, Me.; Indianapolis; Louisville; Cincinnati and Milwaukee for either storage purposes or other war work. The men formerly employed at these plants are working on war production business. The Canadian plant at Ford City, Ont., has been reopened.

### U. S. Rubber Co.'s Earnings Show Big Increase

NEW YORK, Aug. 17—Net earnings of the United States Rubber Co. for the six months ending June 30 amounted to \$10,242,365 after allowances for interest charges, depreciation and reserve for Federal taxes were made. The total earnings for the same period last year were \$7,239,966.

### American de Havillands Make Successful Reconnaissance

WASHINGTON, Aug. 16—Eighteen American-made De Havilland-4 airplanes, equipped with Liberty engines, have made a reconnaissance over the German lines and returned safely, according to a cable from General Pershing to Secretary of War Newton D. Baker. General Foulois, head of the airplane division of the American Expeditionary Forces, personally led the expedition, which also included Lieut. Blair Thaw. This is the first extended use of a complete squadron of Liberty engine equipped planes, and the results were very pleasing to Washington officials.

### Firestone Declares Additional Dividend

AKRON, Aug. 16—In accordance with a resolution adopted in December, providing for the payment of an additional dividend should same be warranted by business development, the Firestone Tire & Rubber Co. has informed its stockholders that as business justifies this payment a special dividend of \$1 per share is declared upon the issued common capital stock of the company. This special dividend is in addition to the dividend of \$1.25 per share, both being

payable on September 20 to stockholders of record September 10.

It is estimated that, after allowing for the restrictions on crude rubber and the production of pneumatic tires, sales for the fiscal year will amount to \$75,000,000. The company is doing an increased solid tire business, and has diverted portion of its plant to war essentials.

### Motorcycles and Bicycles Are Essential

WASHINGTON, Aug. 19—Motorcycles and bicycles have been recognized as essential by the Priorities Division of the War Industries Board, following a meeting between the representatives of these industries with the Board. It was recognized in the meeting that the output of motorcycles is almost entirely absorbed by direct Government purchases, that the remainder is devoted largely to essential commercial purposes and that bicycles have come to be used by workers as a method of transportation.

It was also found that there were opportunities for substantial savings in the use of steel and rubber in these industries and both industries pledged themselves to effect such savings as will be worked out in a program of conservation in co-operation with the War Industries Board.

Subject to those pledges and the carrying out of the conservation plan it was considered necessary to recognize the industries as entitled to their reasonable requirements of materials.

### British Society of Motor Manufacturers Elects New President

BRISTOL, CONN., Aug. 16—Albert Brown, one of the founders of the firm of Brown Brothers, London, England, a company having commercial relations with the automotive industry throughout the world, has been elected president of the Society of Motor Manufacturers and Traders of the United Kingdom. One of Mr. Brown's primary aims is the securing of co-operation between American, French and British business men and with this end in view he has written to President DeWitt Page of the New Departure Mfg. Co. inviting such co-operation and help in getting together.

### Skilled Labor Situation Improves

WASHINGTON, Aug. 16—Curtailement of non-war production is lightening the general labor situation particularly in skilled trades, according to the Department of Labor. Reports received by the Department from Kokomo, Indiana, show that the curtailed output of passenger cars is releasing a number of mechanics for war work. Similar reports from other sections, it is stated, show that conservation of manpower resources is being gained by reduction in the output of so-called non-essentials. The Department of Labor states that despite this improvement the general skilled labor shortage is still serious and can only be relieved by the transfers from non-war industries.

## Organize Wisconsin Tractor Service

Power Farming Association  
Plans Better Co-operation  
with Farmers

MILWAUKEE, Aug. 19.—Plans for bringing tractor service in Wisconsin to a high state of organization and efficiency are now being made by the Wisconsin Power Farming Association, organized by representatives of more than 15 large tractor manufacturers located in or having branches in Wisconsin. A principal activity from the beginning will be to give service to farmers who own tractors in much the same manner as the highly-developed service plans in effect in the passenger and commercial car fields. In line with this policy, it is the intention of the association to make it obligatory upon every dealer in tractors to carry a sufficient stock of parts to enable farmers to keep their machines in service at all times, and more particularly during the rush seasons.

This plan involves also ample provision for quick service in making repairs and replacements, either in an established service station, or on the ground. Details have not been fully developed, but excellent progress is being made and the association hopes to have its plan in operation by the time the fall plowing season begins.

This development in the farm tractor field in Wisconsin is regarded by motor car dealers and garagemen as most favorable to their business, since they have established service stations and generally ample accommodations for carrying stocks of parts, and in addition have a wide experience in furnishing service of this character. Under existing conditions in the passenger car industry, there undoubtedly will be considerable available capacity in many garages open to just such utilization as this. It is felt that the garages in the smaller communities of Wisconsin are particularly well situated in this respect, as they are close to the field of operations of the tractor and can quickly adapt their existing organizations to tractor service without prejudice to the attention required by the present passenger and commercial car demands.

Tractor and motor car men as well, who have made a study of conditions in Wisconsin, say that up to this time the motor car trade has left the tractor business pretty much to the farm implement dealers. One of the reasons ascribed for this fact is that the motor car dealers have been too fully occupied with their ordinary and regular car and truck business to be able to assume the added responsibilities involved in the requirement of tractor sales or distribution rights, with the attendant demand for service.

With the readjustment that is expected to come in the passenger car industry, the way is opened to dealers to enter the tractor business on a broad scale, with

almost every requisite advantage already at hand. At the same time the farm implement trade is rather poorly equipped, relatively speaking. Implement and farm machinery service is an infant, compared to motor car and truck service, and it is nowhere near the state of efficiency that the rapid development of the tractor already requires.

The men who compose the Wisconsin Power Farming Association either are the sales managers of the tractor manufacturers located in Wisconsin, or the state distributors or branch managers. Their business, of course, is to merchandise the product to the greatest possible advantage and the ability to give service is a prime consideration in the selection and retention of tractor dealers. While no intimation has ever been made by any member concerning the availability of motor car dealers in prosecuting tractor distribution, it is known that the position of these dealers, especially with respect to service and maintenance, finds favor among the tractor men and they are willing to give due consideration when the selection of a dealer involves both a farm implement and a motor car representative.

The Wisconsin association has scheduled another meeting for Tuesday, Aug. 27, at the Hotel Medford, Milwaukee, at which time plans will be made for a general tractor meeting during State Fair week, Sept. 9-14. This will be held at the Republican House, Milwaukee, on Friday, Sept. 13, and a general invitation will be issued to dealers and owners to be present to become acquainted with the operation of the tractor service now being formulated.

#### Milwaukee Organizes Branch of National Association of Purchasing Agents

MILWAUKEE, Aug. 17—A Milwaukee branch of the National Association of Purchasing Agents has been organized with a membership of nearly 100, representing as many of the leading industries of Milwaukee and eastern Wisconsin. Officers are: President, Floyd E. Francis, Patton Paint Co., Milwaukee; vice-president, G. H. Money, Federal Rubber Co., Cudahy; secretary, Charles E. Stone, Chain Belt Co. Milwaukee; treasurer, G. A. Platz, Horlick Malted Milk Co., Racine. Among the members are: W. V. Isgrig, Auto Parts Mfg. Co.; H. B. Ibsen, Gemco Mfg. Co., Milwaukee; Robert Stiefoater, Aluminum Goods Mfg. Co., Manitowoc, and E. J. Eggert, Allen-Bradley Co., Milwaukee.

#### 2500 Tractors Operating in Pennsylvania

HARRISBURG, Aug. 17—According to figures furnished by the State Department of Agriculture there are approximately 2500 farm tractors at work in Pennsylvania and the total is increasing steadily week by week. In some districts the number has doubled recently and orders have been placed for many more.

Stanley Porter, production manager of the Jackson Rim Co., Jackson, Mich., has resigned to return to the Hayes Wheel Co. of this city, in a similar capacity.

## Ralph De Palma Wins Five Races

### And Also Breaks Four World's Records at Sheepshead Bay

SHEEPSHEAD BAY, N. Y., Aug. 17—Not content with winning all five of the events on the card in the International Sweepstakes at the Speedway this afternoon before a crowd of nearly 50,000 spectators, Ralph De Palma succeeded in breaking world's records for 2, 10, 30 and 50 miles.

The new records, compared with the former fastest times are:

Distance	Time Today	Previous Record
2 miles	1.05:50	1.12:55 made by Resta last year.
10 miles	5.23:30	5.24:30 made by De Palma July 22 at Chicago.
30 miles	16.31:20	18.56:10 made by Altken several years ago.
50 miles	27.29:20	28.04:53 made by Resta last year at Sheepshead Bay.

De Palma's time for the 20-mile race this afternoon was 10:51:50, the still standing record of 10:50:20 being also to his credit.

The purse of \$27,000 was divided into first, second, third and fourth prizes, the winner of each event receiving 6 points, the second 5 points, the third 4 points and the fourth 3 points. The table below shows the winners of the several prizes, the cars driven and the amounts gained by each driver.

De Palma drove consistently in all the events and as a rule lay in second or third place until close to the finish, when he spurred and passed the others. A notable fact is that there was not a single stop at the pits for tires or for other supplies by any of the cars which finished. The track was in first-rate condition and the starters were sufficiently few to insure perfect racing without crowding, combinations which led the spectators to anticipate the setting up of some new records. Nobody, however, could have prophesied that one man would break four records in a single day.

Flying starts were made in all races, with but a single false start, that of the first race.

Chevrolet experienced hard luck right away, breaking his crankshaft when about half way around the oval and putting his car out of commission for the day. In the second race Chevrolet, by arrangement, used Duray's car, but had to drop out in the fourth lap with a broken valve, a circumstance which prevented Duray from starting in the 50-mile race.

Owing to previous trouble at Columbus,

Vail was unable to tune his car up in time for either the first or second race and although he started in the third his car was obviously not in first-rate form and he dropped out during the fifth lap. In the last race Vail was still having trouble and gave up when lapped by the leaders in the fifteenth.

During the progress of the events the spectators were thrilled by the daring evolutions of a biplane piloted by officers from Mineola.

#### Radio Work Training Schools Established

WASHINGTON, Aug. 19—Training schools for radio work have been established by the Division of Military Aeronautics at West Point, Ky., and Camp McClellan, Ala., field artillery firing centers, and instruction work along these lines will eventually be extended to Ft. Sill, Okla., and Camp Jackson, S. C., and also to field artillery firing centers where observation schools of the Division of Military Aeronautics are now working in co-operation with the Artillery Branch of the Service.

Heretofore advance schooling was to be obtained only when the American troops reached France.

Instruction in radio covers wireless communication between the flyers in the air and the gun crews on the ground below. By means of radio the flyers are able to signal for barrages, the location of batteries, ammunition dumps, infantry, trains and other targets, and also to "spot" for its own particular battery, which means to tell that battery whether its shells are landing to the right or left, over or under the target at which it is firing.

#### New Steel Hangars at Ellington Field

WASHINGTON, Aug. 19—Six new steel hangars, costing between \$9,000 and \$11,000 each, are being constructed at Ellington Field, one of the Gunnery Schools of the Air Service, at Houston, Texas. The new hangars will be used in connection with work in bombing which is soon to be started. Three hundred and thirty-three acres of land near Ellington Field have been secured for the bombing field.

Besides the main field known as Ellington, there are five auxiliary fields near Houston all of which are used in the training of fliers. New extensions include the utilization of land at Park Place and on the Gulf, near San Leon, Texas.

#### Warner Gear Adds New Plant

MUNCIE, IND., Aug. 17—A contract has been let by the Warner Gear Co. for the erection of a large plant, to cost approximately \$250,000.

#### The Results at Sheepshead Bay

Driver	Country	Car	Points	Prize
Ralph De Palma	Italy	Packard Special	30	\$17,000
Ralph Mulford	United States	Frontenac Special	22	5,000
Dario Resta	England	Resta Special	19	3,000
Arthur Duray	Belgium	Frontenac Special	6	1,000
Louis Chevrolet	France	Frontenac Special	0	...
Ira Vail	United States	Hudson Special	0	...

## Expect 25% Cars for 1919

Dealers Have Hearing with  
War Industries Board—  
No 100% Cut

WASHINGTON, D. C., Aug. 16—The National Automobile Dealers Association piloted by President E. W. A. Vesper assisted by Manager Ed. Peake and a score of leading automobile dealers and distributors waited on the War Industries Board here to-day with regard to the 100 per cent curtailment letter which the Board sent to the National Automobile Chamber of Commerce, and was able to have a very satisfactory hearing with the board.

The dealers' debut with the board opened up good possibilities of satisfactory working with it and the dealers came out of a 2-hr. hearing feeling that instead of the industry going to be cut 100 per cent there is every indication that the War Industries Board will curtail only what is necessary and that in all probability the makers will continue through 1919 on a 25 per cent basis as compared with 1917. It is possible that this percentage may be increased to 30 or higher.

Co-operation was the complete aim of the dealers in their working with the Board and they in turn were quite favorably impressed with the desire to co-operate with them on the part of the Board. The Board expressed a desire not to entirely stamp out the industry, which seemed to carry home the thought that the 100 per cent letter the Board sent to the N. A. C. C. was simply a reprisal for the N. A. C. C. members coming forward with a 50 per cent offer for 1919 before they had turned into the Board the steel inventories that the Board asked for in July.

The dealers were frank in all their transactions with the Board and made no effort to conceal any of their real intentions. They did not have to tell the Board about the utility of the automobile in the farming sections, as the Board has

heard that so often that it is almost a delicate question with some of the members. From the dealers conference it is apparent the Board is quite fully advised on all facts relating to the industry.

While the board did not give any definite answer on what percentage the automobile industry would continue on for 1919 the attitude of the board was quite different from the general trend of its letter to the N. A. C. C., which would indicate that personalities are taking the place of sound business ethics in the dealings of the board and the N. A. C. C. The trouble seems to lie on both sides. Leaders in the War Industries board occasionally refer to the automobile industry as an unpleasant subject, one they apparently do not care to discuss. What the reasons back of this are can scarcely be deciphered. The dealings of the N. A. C. C. are to some extent responsible.

It was poor policy for the N. A. C. C. to ask for a 50 per cent bargain for 1919 when the War Industries Board was facing a steel shortage. The figures showed that 20,000,000 tons of steel were needed for the next 6 months and that the manufacturing capacity of the nation was only 16,500,000 tons. The War Industries Board could not possibly agree to a 50 per cent deal when faced with such figures, which figures, by the way, the majority of the steel makers have declared to be the closest to actual requirements that have been given.

It was because of this situation that the War Industries Board asked for the inventories rather than a specific bargain. Some have intimated that one of the objects of the board may have been to get an accurate line on the amount of steel held by the automobile concerns rather than to want the inventories for the purpose of balancing them and continuing the industry as long as possible at a possible maximum.

So long as the War Industries Board is confronted with a production of steel lower than government needs there is no possibility of a specific bargain, and under such conditions the better course would be that of getting every possible bit of steel to balance up inventories, thereby securing the greatest possible good out of the steel on hand.

## Airship Divisions for Dayton

Technical Division Moves This  
Week—Engineering  
Also to Go

WASHINGTON, Aug. 20—The many reports that important divisions of both the Department of Aircraft Production and the Department of Military Aeronautics will be moved from Washington to Dayton are now assuming concrete form. The technical division of the Department of Military Aeronautics, headed by Colonel T. E. Bayne, will move its complete organization from this city to Dayton this week, where it will be located permanently. The engineering divisions of the Department of Aircraft Production, which is headed by Charles W. Nash, who also controls the production section, it is reported will be removed to Dayton shortly.

These moves, which have been advocated for sometime by AUTOMOTIVE INDUSTRIES, are expected by the Government officials to create more complete contact between closely allied divisions of the air service which have heretofore been separated by a thousand miles.

Dayton, it is pointed out, is practically the center of aircraft production and operation. It is close to Detroit, Indianapolis and Cleveland, has plane factories and fields itself, and thus, it is stated, will afford excellent opportunities for the technical and engineering divisions heretofore in Washington, to gain direct and practical knowledge, and to arrive at better understanding with the officials in the fields.

### Traction Engine Co. Builds Factory

BOYNE CITY, MICH., Aug. 16—The first factory unit of the Traction Engine Co., manufacturer of kerosene-gasoline engines for tractors and trucks, is under construction and will be completed within 30 days. The building is 65 by 130, and contains approximately 8500 sq. ft.

## An Appeal for Standard Tractor Frames

*THE makers of this tractor—and they are not small manufacturers—were forced to adopt the expedient of cutting and splicing the main frame at its point of greatest load because they could not buy a pressed frame which would meet their requirements, and incidentally those of some fifty or more other tractor makers.*

**When will the work of tractor  
standardization begin?**

## Agricultural States Leaders in Cars and Trucks

(Continued from page 311)

Illinois, Missouri, Michigan, Nebraska, North Dakota, Oregon, South Dakota, Washington and Arkansas. To these can be added Kentucky and Tennessee.

The actual registration gains in these different states follow:

Illinois .....	22,450
Pennsylvania .....	19,724
Missouri .....	18,974
Wisconsin .....	17,154
Michigan .....	17,019
Nebraska .....	11,499
North Dakota .....	6,121
Oregon .....	8,434
South Dakota .....	10,842
Washington .....	6,900
Arkansas .....	10,138
Kentucky .....	10,138
Tennessee .....	5,500

The registration gains in these agricultural states are more conspicuous in contrast with the greatly reduced gains in what might be designated manufacturing states and those containing large centers of population. New Jersey and Massachusetts, two leading manufacturing states, have been shown to have decreased. Maryland and Delaware, both essential manufacturing states, show very small gains, small compared with the corresponding period a year ago. Delaware has added 958 registrations and Maryland 2824. Connecticut, a leading manufacturing state and one that gained very heavily a year ago, has added only 1258 in the past 6 months. Rhode Island, essentially a manufacturing center, has added but 1257.

The manufacturing states that have gained heavily in registrations are those that cannot be termed more than quasi-manufacturing ones, all sharing very largely in agricultural pursuits and often mining as well. In this class are Michigan, very heavily reduced as compared with a year ago in new registrations, and Wisconsin and Illinois.

The percentage of gains in registrations in the past 6 months is largest with what can be designated the Solid South, which showed very heavy gains in January. These are continuing. The gains approximate 30 per cent for the area. Naturally the District of Columbia with its unprecedented increase in population since the war began is a leader with a gain of 15,771 as compared with a corresponding gain of 1470 in the first 6 months of 1917. Its percentage gain is 74. With the population of Washington increased approximately 100,000 it is not surprising that such a gain in registrations should have taken place.

Continuing with the Solid South, Alabama shows a gain of 11,986 as compared with 6749 a year ago in the same period. Florida has gained 4530 compared with 1770 last year. Georgia has gained 17,025 as compared with 12,225 in 1917. Other gains in the same period are: North Carolina 6121 as compared with 4656; West Virginia 5094 compared with 4646; Kentucky 10,143 compared with

7200; and in South Carolina and Mississippi the figures for this year are practically the same as those for last year. The influence of cotton and lumber in the South is strongly shown in these figures.

No other one section of the country has shown such a drop this year as New England which has a total of 7106 fewer registrations as of July 1 than a year ago. Two of these six states show losses and the gains of the other four are scarcely one-quarter of the total drop in Massachusetts and Maine. Vermont has increased by but 64; New Hampshire by 166; Rhode Island by 1257, and Connecticut by 1258. Two show a total loss of 9851 and the other four a total gain of but 2745. New England is essentially manufacturing as opposed to agricultural and here is one of the most convincing arguments as to where the cars sold in 1918 have gone to. The demand has been from the fertile acres of the Mississippi Valley rather than from the centers of population or the centers of manufacture. These automobiles have been going into 100 per cent utilitarian service and not into any so-called avenues of luxury.

What might be designated the mining states of the West all show a dropping off in registrations. There are six of these states and as a group they do not show so heavy a falling off as the manufacturing area of New England. The

entire six have only added about 18,000 new registrations, not so many as the State of Missouri. The figures showing registration gains in the first half of this year are:

Arizona .....	1,914
Colorado .....	6,350
Idaho .....	4,080
Nevada .....	740
Utah .....	3,024
New Mexico .....	1,659

It is impossible to give complete and accurate registrations on motor trucks as many states do not segregate them from automobiles. Taking definite figures from those states that have them and obtaining estimates from others, a conservative estimate put the total number of trucks in use at 500,000. Until recently all of the trucks were used in the environs of the larger centers of population and in the smaller cities but the farmer has become a factor in truck buying and the truck is going onto the farm along with the tractor, the electric lighting outfit and the individual type of ice making machine.

## Two Facts Emphasized

Further analysis of the registration figures for the several states emphasizes two indisputable facts:

One—The shortage of farm labor is compelling the continuance of the purchase of motor cars to such an extent that the farmer consuming time with the slow horse is being looked upon as a soldier of industry who is working below his possible and desirable capacity in these war days.

Two—The law of supply and demand is working out admirably in manufacturing and population centers where car sales have uniformly fallen off. This is convincing proof of the extent to which this part of our population has been supporting all forms of war subscriptions and indicates the natural falling off that must be expected due to the removal of the young men who have gone to France. It is an answer to the luxury argument of the automobile. It is a reminder to those who visualize the national aspect of the car from the streets and highways of our Atlantic seaboard, that the true picture of the automobile in its varied aspects of utility is found in the grain areas between the Alleghanies and the Rockies and on the Pacific slope beyond.

## Chalkis Co. 100 Per Cent Efficient

DETROIT, Aug. 20—According to information given out by the War Department the Chalkis Manufacturing Co. is one of the five gun plants credited with a 100 per cent complete machinery installation and in full operation. There are sixteen new gun plants for forging and machining of cannon on the official government list. In the erection of these plants the United States has expended \$34,768,297, of which \$607,993 is credited to the Chalkis concern. In all the sixteen plants in operation, cannon or cannon forgings for mobile artillery from 1½ in. to 10 in. are being produced.

## GAINS AND LOSSES BY STATES

State	1917 First 6 Mos.	1918 First 6 Mos.

Wisconsin .....	24,477	18,169
Wyoming .....	2,575	1,649

## A Priority Board Warning

Inadvisable and Useless to Employ Agents to Obtain Certificates

WASHINGTON, Aug. 16—Manufacturers and the public generally are advised of the uselessness and inadvisability of employing agents to obtain priority certificates or preferential treatment from the War Industries Board in an open letter by Edwin B. Parker, Priorities Commissioner of the Board. The letter follows:

### "TO THE PUBLIC:

"The attention of the Priorities Division of the War Industries Board has been called to the fact that certain individuals are offering their services and soliciting employment to present priority applications and procure the issuance of priority certificates, and also to use their alleged influence in having industries accorded preferential treatment.

"The rules and regulations of the Priorities Division are clear, simple, can be readily followed and will be furnished to anyone applying therefor. The employment of agents not only burdens the applicant for priority with a wholly unnecessary expense, but an attempt on the part of such agents to exert personal influence—which it is needless to say they do not possess—may have a tendency to prejudice the applicant's cause.

"EDWIN B. PARKER,  
"Priorities Commissioner."

### Former Texas Co. Engineer Dies from Exhaustion

WASHINGTON, Aug. 15—Capt. O. J. May of Chicago, an officer of the Equipment Division of the Signal Corps, and

formerly lubrication engineer for the Chicago district with the Texas Co., died in consequence of the severe strain to which he was subjected in conducting a 65-hour test of a new oil for lubricating air engines.

Captain May conducted test after test until completely exhausted, and as a result his vitality was insufficient to withstand a severe cold caught a few days after the tests were completed. It is stated that his individual efforts have resulted in a very great saving to the Government, as the tests upon which he was engaged will provide the air forces with a satisfactory lubricant at a cost of but one-fourth of that formerly used.

### The Week's Flying Accidents

WASHINGTON, Aug. 16—Five deaths resulted from flying accidents at fields in this country during the week ending August 10. This was at a rate of one death for every 4408.5 hours flown, or 362,572 miles of air flying. The accidents occurred at:

Gerstner Field, Lake Charles, La.....	1
Post Field, Fort Sill, Okla.....	1
Scott Field, Belleville, Ill.....	1
Taliaferro Field, Fort Worth, Tex.....	2
Total .....	5

### Moline-Knight Prices Increased

EAST MOLINE, Aug. 15—Prices on the different Moline-Knight models have been increased as follows:

Model	Old Price	New Price
G—7-pass. ....	\$2,375	\$2,500
4-pass. de Luxe....	2,375	2,500
C—5-pass. ....	1,750	2,000
L—4-pass. roadster....	1,750	2,000
L—Touring sedan ....	2,280	2,500

### Will of Francis E. Stanley

NEWTON, Mass., Aug. 17—Francis E. Stanley, inventor of the Stanley steamer, who was killed in an automobile accident on July 31, left an estate estimated at approximately \$500,000. In his will filed a few days ago he left \$100,000 to his son, Raymond W. Stanley, and the rest of the estate to his wife.

## Ford Plans Use Water Power

Will Spend Millions of Dollars in Developing Resources United States

DETROIT, Aug. 17—Henry Ford credited with a scheme whereby the power of the country will be utilized in connection with a number of Ford tractor plants. The first factory to use water power will be located at Hamilton, Ohio, its cost being estimated at \$1,000,000. Other plants, similarly situated, will be established throughout the country. The general plan involving use of water power on a large scale will be developed at Hamilton and will afterwards be extended to other centers. Power derived from the Little Miami River at Hamilton will be sufficient to turn out 300 tractors per day during winter months when the available water power is at its maximum. During summer, when the stream is reduced, the plant is to be used for melting steel with the aid of electricity.

### President of M. A. M. Confers on Service Committee Duties

NEW YORK, Aug. 16—In addition to general routine matters discussed at a meeting of the executive committee of the Motor and Accessory Manufacturers Association held to-day, plans in connection with possible activities of the War Service Committee were considered with the result that president C. W. Stiger has arranged to go to Washington for the purpose of conferring with the Chamber of Commerce of the U. S. A. as to the ways in which this committee can assist the Government.

Early in September Mr. Stiger will attend a joint meeting of both the executive

270 jobbers and manufacturers attended the Bicycle and Motorcycle Convention held during the first convention

the war service committees, probably at Detroit, to give effect to the results of his interview at Washington. It has not been definitely decided whether or not the Motor and Accessory Manufacturers shall have a permanent representative at Washington.

#### War Department Gives Manufacturers Information on Contracts

WASHINGTON, Aug. 16—In order that the manufacturers can learn full information regarding the needs of the War Department, the General Staff will place manufacturers on the mailing list and send each of them requests for bids for the products which he is able to provide. Manufacturers, in sending in their names to the Supply Bureau, Director of Purchases and Supplies, General Staff, U. S. Army, Washington, D. C., should also include satisfactory references from banks or reputable business concerns, or from the chairman of the Local Regional Manufacturers Organization associated with the War Industries Board.

#### Starting Device Adapted to Aircraft Engines

MILWAUKEE, Aug. 17—A starting device for heavy duty engines, designed several years ago by Nels A. Christensen, a noted inventor and engineer of Milwaukee, principally for application to motor fire apparatus and similar purposes, has been refined by him to suit the requirements of aircraft. Several hundred hydroplanes in use at the navy aviation camp at Great Lakes, Ill., have been equipped with the starter. Mr. Christensen personally superintended the installations and made numerous practice flights to demonstrate the efficacy of the apparatus. He is president and general manager of the Christensen Engineering Co., 816 First National Bank Building, Milwaukee.

## Improved Methods of Shipping Airplanes

### Close Study of Problems Has Resulted in Saving Overseas Freight Space

WASHINGTON, Aug. 19—Shipment overseas of American built airplanes has been considerably improved by the Aircraft Production Board as the result of studies in plane boxing and shipping problems. Shipment of American De Havilland bombing planes, for example, as now made, saves 644 cubic feet of space over the former methods for each airplane sent. This amounts to a cost saving of \$3,864 per plane, figuring shipping space at \$6 per cubic foot. In addition, 1000 board feet of lumber is saved in the boxing. Mine packing boxes are used to ship 4 battle planes. The gross weight of the 4 planes is 11,000 lb., and when packed, 27,000 lb. Four of the 9 boxes contain front sections of the fuselage. One contains 4 rear sections; 2 hold 2 sets of wings each; 1, 4 sets of rear controls, and 1 set of ailerons. The total space required for 4 planes so crated is 3547 cu. ft. In addition to the parts actually required to complete the 4 planes, spare parts are shipped. Two main wing boxes are sent with each unit shipment of 4 planes, and contain besides the wings with their fittings, axles, wing skids, landing gears, wiring plates, wheels, tires, struts and fittings. One aileron box is included with each shipment of 4 planes.

Shipment of spare parts for 100 De Havilland planes required 105 cases weighing 164 tons. With every plane there are also shipped 2 Marlin synchronizing machine guns operated by the pilot, 2 Lewis flexible machine guns operated by the gunner, camera, attachments for radio set, heating and lighting equip-

ment, bombing equipment, air pressure gages, oil pressure gages, aneroid barometer, clock, compass, map case, fire extinguisher, safety belts, Very signalling pistol, etc.

All boxes are lined with water-proof paper and the tops covered with tarred felt fastened down on the sides and ends. All the joints are sealed with cement and the exteriors are given two coats of paint. Minute directions are given for packing the various parts of the airplanes. Braces and supports within the box are so constructed as to support the engine and fuselage. Metal parts which might corrode are protected by a neutral slushing compound which is resistant to the effects of sea air and salt water. The instruments on the instrument board are heavily covered with a coating of paraffine, the more delicate instruments being removed and packed carefully in special boxes which in turn are sealed in airtight tin boxes.

#### Wages Increase in May—Number of Employees Practically Unchanged

WASHINGTON, Aug. 16—Wages in the automobile manufacturing industry increased 7.1 per cent for the manufacture of May, 1918, as compared with the manufacture of April, 1918, according to the reports of 48 factories. The number of employees for the same period remains approximately the same, with 114,979 employed in 48 factories in April, 1918, and 114,944 in May, 1918, a decrease of less than one-tenth of 1 per cent. The wages paid by the 48 companies to 114,944 employees in May, 1918, were \$3,015,637.

Forty-seven automobile companies reported 120,000 workers in May, 1917, as against 114,745 workers in May, 1918, a decrease of 4.5 per cent, while wages increased from \$2,773,654 for the manufacture of May, 1917, to \$3,011,044 for May, 1918, a wage increase of 8.6 per cent or a total wage increase counting the decrease in workers of 11.1 per cent.

August at Atlantic City. Over 50 manufacturers of automobile parts were present at this, the largest, con-kind ever held

# Industrial Review of the Week

## A Summary of Major Developments in Other Fields

### Bituminous Production

#### Recedes Steadily

In the face of ever-increasing demands for bituminous coal, production recedes steadily week by week from the 13,286,000 net tons reported in the record-breaking week ended July 13. Estimates made at the beginning of the coal year for the tonnage of fuel necessary for essential uses have proved to be too low, the latest revised figures showing that every possible effort will have to be made by the coal-mining industry if the war program is not to suffer a setback. The requirements for the Navy, for instance, were originally fixed at 3,500,000 net tons for the year. It now is estimated that Uncle Sam will need at least 8,000,000 net tons for his vessels before the end of 1919.

An idea of how fast the Navy is consuming fuel may be had from the fact that the demand in July from this source had risen to a 6,000,000-ton-a-year basis. The shipyards, too, are speeding up production to such an extent that the 10,000,000 net tons considered a liberal allowance for the Shipping Board on April 1 have been increased by 3,000,000 tons. Another phenomenal increase is in the demand for bunker fuel. At the beginning of the coal year 13,500,000 tons were assigned for this purpose, with the thought that this amount would prove adequate. The estimate has now risen to 21,000,000 tons. When to the foregoing figures is added the coal needed by plants that have been enlarged, and the additional fuel required to keep a large percentage of industries operating on a 24-hr. basis, it can be seen that the problem confronting the soft-coal mines is one of no mean proportions.

For the week ended Aug. 10 (the latest statistics available), the output of bituminous coal is estimated at 12,274,000 net tons. This means an average production of 2,046,000 net tons a day for this period, which is 54,000 net tons below the daily output established as a minimum. To emphasize the seriousness of the situation still further—the soft-coal mines are now 14,500,000 net tons behind schedule, and it is a foregone conclusion that they will never catch up.

The causes for the fall in output seem to be divided between car shortage and labor unrest, with the greater part of the blame attaching to the former. Record production can only be achieved when the railroads manage to keep an adequate number of empty coal cars moving to the mines and the transportation of loaded cars is speeded up. This statement is substantiated by the fact that the peaks in the coal production chart result when the railroads operate at maximum efficiency. Operations in the Pittsburgh district are short of 200 cars a day, and on Aug. 16 many of the mines in that region

were at a standstill for want of cars. In the Kanawha and Coal River districts of West Virginia car shortage was responsible for the loss of 1347 productive hours during the week ended Aug. 10. In Alabama, too, the lack of cars caused a decided decrease in output.

Despite reduced labor forces, the output of anthracite coal continues to keep well ahead of the quantity mined last year. Hard coal shipments during the week ended Aug. 10 totaled 2,051,933 net tons, a decrease of 6.4 per cent compared with the week preceding. The total output of anthracite coal in July amounted to 7,084,775 tons, an amount exceeded only twice before; but what is even of more importance, virtually the entire tonnage of anthracite mined for the first quarter of the coal year—April to July—is in the hands of the consumer.

Nothing should be tolerated that will interfere with anthracite production if the public is to be supplied with coal. There is evidence that Hun propaganda is rife in the hard-coal regions—in the shape of both covert and open acts calculated to create discord in the labor ranks. The mining force should by every possible means be maintained at its present figure.

Shipments of soft coal to the lakes grow more and more disappointing. It is feared that the Northwest will not get over 25,000,000 tons, instead of the 28,000,000 aimed at. The first eleven days of August saw lake shipments of bituminous—exclusive of vessel fuel—only 1,535,996 tons. The Fuel Administration schedule calls for 4,900,000 tons. July closed 1,000,000 tons behind, and it appears that August will add about 1,250,000 tons to this deficit. For the week ended Aug. 17 the estimate of shipments to the Northwest is 1,020,000 tons. The Pittsburgh district has not been able to respond to the 1600-car-a-day order, due to the unsatisfactory car supply referred to earlier in this review and a marked shortage in motive power—*Coal Age*.

#### Garford Prices Advance

LIMA, OHIO, Aug. 20—The Garford Motor Truck Co. increased the prices of its trucks and tractors on Aug. 15 as follows:

TRUCKS				
Model	Ton Chassis	Old Price	New Price	
75 C	1	\$2,100	\$2,500	
66 B	1½	2,500	3,000	
66 BL	1½	2,600	3,100	
70 B	2	3,000	3,300	
70 BL	2	3,100	3,400	
77 B	3½	3,900	4,300	
77 BL	3½	4,000	4,400	
68	5	4,700	5,000	
68 L	5	4,800	5,100	
69	6	4,900	5,300	
69 L	6	5,000	5,400	
TRACTORS				
Model	Ton Tractor	Old Price	New Price	
70 B	4½	3,100	3,400	
77	7	4,000	4,400	
68	10	4,800	5,100	

### Prepare to Meet Demand for Industrial Steel

The meeting of the special sub-committee of steel manufacturers with Government representatives at Washington on Thursday, Aug. 22, and the calling of a general meeting of steel manufacturers in New York for the following Wednesday point to the taking of new and important steps to meet the demand for ship, munitions and railroad steel.

Coal and coke supply still limit pig iron and steel output. The continuance of an adequate labor supply under the new call for fighting men is a serious problem, and even more grave is the situation caused by the set purpose of labor leaders to bring about union control of the steel industry.

Washington is not so much concerned about the construction of new iron and steel capacity, which would be from 12 to 18 months in the building, as about getting the full fighting effect of existing plants. It is certain, therefore, that in the remainder of the year the changes in metal-working industries due to concentration on war work will be more marked than they have been in the past six months.

The situation as to coal and coke and transportation does not measure up to the enlarged requirements of the war. With an average of 360 blast furnaces operating last month, the pig iron output was 110,000 tons a day. With an average of 335 furnaces operating in April, May and June of last year (25 less than in July, this year) the pig iron output for those three months also averaged 110,000 tons a day. Thus 25 more furnaces are required now to keep output up to the rate of last year.

The pig iron shortage complained of for months grows more acute; but the proposal from Washington that the few remaining cold furnaces be started up will come to little. Operators of some of the small furnaces now blowing, particularly in the South, threaten to put them out if the pig iron price is not advanced by October.

Pig iron allocations in the week have been relatively small. Pending demand includes a round lot wanted for the first 500,000 semi-steel shells to be made for the Government.

The unusual pressure for production is shown in the placing with wire makers of a good percentage of the 82-mm. rounds wanted for shells to be shipped this month to France. Putting the lighter billet mills of these plants on munition steel will mean for the time being a very limited output of wire as the rate for months has been only about 60 per cent of normal.—*Iron Age*.

## Taxation of Cars Protested

A.A.A. Presents Facts and Figures on Subject to Ways and Means Committee

WASHINGTON, Aug. 19—Less than 3 per cent of all of the motor vehicles produced in 1917 sold at \$2,500 or more. On the Cleveland-Akron Highway, of 13,979 vehicles traveling over the road in a week, only 685 were horse-drawn, and more than 2000 were motor trucks carrying 5014 tons of freight, which was only slightly less than 6630 tons hauled in the same week by the 3 railroads. Thirty-three thousand people were transported by the 10,000 passenger cars. These figures and others asserting the importance and essentialness of the automobile industry, and in protest to direct Governmental taxation on motorists, were placed before the Ways and Means Committee this week by Dr. David Jameson, President of the American Automobile Association. Dr. Jameson asserted that it would be as fair to tax coal as gasoline, and referred to the fact that any tax on new cars would be passed along to the consumer. He also contended that any tax on the original cost of used cars would be unjust. This proposed tax on new cars has been changed since Mr. Jameson filed his communication, and is now based on horsepower. Dr. Jameson's letter follows:

"As the spokesman in an organized form of the motor car owners of the country, we did not seek a hearing before your committee, as we are of the opinion that the present comprehensive use of the automobile is entirely clear to all of you. There are a few points, however, we would like to bring to your attention.

### Farmers Biggest Buyers

"Of the 1,798,600 motor vehicles produced in 1917, less than 3 per cent sold at \$2500 or upwards. Three out of every four cars cost not over \$1200. These 1,365,000 represented 75 per cent of the total. Every other car was a certain popular make selling close to \$500. Farmers were the best buyers as a class, absorbing 53.1 per cent of the total vehicles manufactured.

"Our investigations recently by chairmen of good roads, legislative, and touring boards support anew the contention that the passenger automobile is now nine-tenths for utility and scarcely one-tenth devoted to what has been designated as 'pleasure riding.' True it is that vacation periods may be spent in the form of interstate road journeys and there may be local evening and Sunday trips, but the fact remains that a preponderating percentage of the car's mileage is employed by members of the family to crowd more work into one day than was ever before possible.

"If your committee decides that there should be substantial taxation of an essential like highways transportation—and all forms are considered—we shall accept without protest your findings, believing that war revenue necessities demand such action.

"Railroad conditions have compelled an increasing use of the highways, to the extent that long distance traveling is more general than in previous years. The figures come to us through the distribution of thousands of maps by the road bureaus at our national headquarters in Washington and New York, besides which we supply our several hundred clubs in all parts of the country.

"One illuminating example of what can be done where a highway is constructed capable of meeting maximum traffic demands exists in a forty-mile stretch of Ohio road connecting Cleveland and Akron. A census for a week taken in March by students of

the Case School of Applied Sciences gave a total of 13,979 vehicles, of which only 685 were horse drawn. Fifteen per cent of the total were motor trucks, which carried 5014 tons of freight, compared to 6630 tons shipped by three railroads. Thirty-three thousand people were transported in passenger automobiles.

"Proposed levies upon users of gasoline motors and engines would amount to about one-quarter of a billion dollars. Purchasers of new cars, of course, would pay the tax imposed on the dealer, who would pass it along to the consumer. The gasoline tax would be determined by the car's mileage, which undoubtedly would be reduced to a minimum. A federal license tax in addition to that now imposed in all states is manifestly unfair, and especially so if based on the original price of the automobile. All these would be largely a tax on industry and would seem unreasonably excessive on one branch of industrial activity, already taxed heavily by the states.

"The proposed tax will hamper the agencies of production, the fuel and the power they employ. We might as well tax coal as gasoline, which is doing more than any other agency to relieve the conditions resultant upon the scarcity of coal. It is estimated that the power generated by gasoline exceeds that generated by coal and steam nearly ten to one; the horsepower produced by steam being estimated at about 11,000,000 and that of gasoline at over 100,000,000.

"In these days, when our social system is on trial, one of the chief concerns of the Congress should be the safeguarding and the promotion of the sources of national wealth, this to the end that we may endure the great and prolonged strain to which the war will subject us. Industry is the greatest source of national wealth. Is it good economics to tax this greatest source of power known to American industry? When we tax fuel, we tax industrial life at the very source of its vitality.

"In conclusion, might we again call notice to the present excessive taxing of motor cars in practically all states, which in some instances includes registration of car. Its listing in the personal property tax, and the necessity of paying for an operating license for each member of the family who drives the vehicle. Surely it is even now a plentifully taxed necessity.

"Furthermore, the motor car owner is a citizen, and, as such, meets other civic obligations and pays whatever general taxes are imposed. He, however, senses unfairness in being conspicuously singled out every time there comes need for revenue increases."

### March Aids Wisconsin Rural Express Lines

MILWAUKEE, Aug. 19—Alton J. March, head of the A. J. March Motor Truck Co., 215 Wisconsin Street, Milwaukee, and president of the Milwaukee Automobile Dealers' Association, has accepted appointment as Wisconsin representative of the national motor truck committee of the National Automobile Chamber of Commerce and already is making preliminary arrangements for the establishment of rural motor express lines in this State. Mr. March has enlisted the support and co-operation of the State and Milwaukee Councils of Defense; Milwaukee Association of Commerce, Milwaukee Chamber of Commerce, Wisconsin Highway Commission and numerous other organizations to work out a plan of operation to be put into effect immediately.

### Aviation Gunnery Fields Leased

WASHINGTON, Aug. 19—Several fields are being leased by the War Department for the extension of instruction in gunnery for aviators in order that they may be trained on this side of the Atlantic. One tract of 10,000 acres has been leased near Fort Worth, Texas, not far from Taliaferro, Barron and Caruthers Field. Another tract of 750 acres has been leased near Lufbery Field, L. I.

## Enough Cotton Fabric for Planes

U. S. Production Averages 1,200,000 Yards per Month—Sufficient for All Needs

WASHINGTON, Aug. 19—The production of American cotton airplane fabric is now averaging about 1,200,000 yards monthly, sufficient for all requirements, and capable of being largely increased if necessary. No more linen fabric is being imported from abroad for this purpose, and after the imported stock now on hand is exhausted, cotton fabric will be used exclusively in covering American airplane wings.

At the outbreak of the war in 1914, linen was the only material which had proved entirely satisfactory for covering airplane wings, the essential physical properties required being lightness in weight, proper absorption of dope and strength and resistance to tear.

The chief countries before the war producing flax for fine grades of linen were Belgium, Russia and Ireland. The Belgium supply was cut off from the Allies in 1914. Russian flax was difficult to obtain and was later cut off entirely. In the meantime the consumption of linen for war purposes had increased enormously. By the spring of 1917, when the United States entered the war, the linen situation was very serious and it was obvious that some substitute would have to be found.

In developing a cotton airplane fabric which would have the necessary qualities of the linen, the U. S. Government received the greatest assistance from the various cotton mills.

Samples were made from cotton of many constructions and numbers of yarn, varying from No. 40 two-ply to No. 100 four-ply, the cloth having from 50 to 90 threads per inch. Yarns were in some cases mercerized under tension and various twists were tried. Several cotton mills co-operated in this work.

When the new fabrics were secured, samples were put on airplanes, "doped" and varnished, according to regulation practice, and tested in actual use at Langley Field and Pensacola. Flying tests were also made with several other varieties of fabric. The tests were for three months of service, averaging ten hours per day. Members of the U. S. Air Service, members of the foreign flying corps and other experts assisted in the experiments. They reported that the cotton fabrics developed in the United States appeared to serve most favorably. Other very favorable reports have recently been received from tests made in Great Britain on American cloth sent over there.

After many experiments had been made, the first contracts for 10,000 yards each of cotton airplane fabric were placed in the middle of September, 1917. The results obtained were satisfactory and it was decided to place further contracts.

Two fabrics were adopted, the specifications calling for a strength of not less

than 80 lb. per inch in both warp and filling. The cotton used had to be of a very long staple and in November, 1917, the Air Service purchased 15,000 bales of long staple Sea Island cotton.

The first quantity orders for cotton airplane fabric were placed in October and November, 1917, and were for 1,280,000 yards of Grade A and 200,000 yards of Grade B. Deliveries of cotton airplane fabric started in January with the production of 173,000 yards. Production has gradually increased until at the present time 1,200,000 yards are being produced monthly.

Subsequent contracts have been let for cotton airplane fabric amounting to 11,513,084 yards. All of these later contracts, however, have been for Grade A cotton fabric, as it now seems clear that this cloth is superior to the other.

While the cotton airplane fabric was at first used only for training planes, and the Grade A standard linen fabric, which was imported from Great Britain, was used for combat planes, it was decided in April, 1918, that the Grade A cotton fabric could be used for all types of planes.

#### Draft Is Not a Factor in Industrial Disputes

MILWAUKEE, Aug. 17—Because of a report that an employer at Madison, Wis., involved in labor difficulties, attempted to use the deferred classification of employees under the selective draft service act as a leverage upon their industrial status, Gov. E. L. Philipp and the draft administration of Wisconsin have issued an official statement condemning this "reprehensible practice" and assuring the public that the draft will in no way be permitted to become a factor in industrial disputes. It is announced that a striking employee will be given a reasonable time to find employment similar to his present work so that he may continue in his deferred classification. The period will be about ten days, at the end of which time reclassification will be considered.

#### Crude Rubber Imports Limit for August and September

WASHINGTON, Aug. 16—Importation of crude rubber has been limited to 16,666 tons for the months of August and September. This is proportionate to the rate tentatively fixed by the War Trade Board for the quarter ending July 31, 1918, which was 100,000 tons per year. The rubber imports for August and September will be allocated by the Bureau of Imports along the general lines of the previous allocation, with certain changes to take care of increased Government requirements.

#### Republic Rubber Co. Declares Dividend

YOUNGSTOWN, OHIO, Aug. 19—The Republic Rubber Co., Youngstown, Ohio, has declared its regular quarterly dividend of 1½ per cent on first preferred stock, payable Sept. 1 to stockholders of record Aug. 25.

## Gasoline Production Well Maintained

June Totals Slightly Below Those of May, but Daily Production Greater

	June, 1918	May, 1918
Crude oil (bbl.).....	28,140,479	28,510,698
Gasoline (gal.).....	315,023,445	319,391,160

	June 30, 1918	May 31, 1918
Crude oil (bbl.).....	11,956,151	11,824,633
Oils purchased to be re-run (bbl.) .....	932,561	872,300
Gasoline (gal.).....	418,440,353	460,637,479
Kerosene (gal.).....	426,285,676	343,311,945
Gas and fuel (gal.).....	550,704,759	515,020,224
Lube (gal.) .....	158,316,257	161,009,729
Wax (lb.) .....	169,424,428	168,171,328
Coke (ton) .....	17,478	15,583
Asphalt (ton) .....	97,631	104,214
Miscellaneous (gal.).....	273,877,024	317,115,697

WASHINGTON, Aug. 16 — During June, 1918, the average daily production of gasoline was 10,500,781 gal., an amount slightly in excess of the daily production average for May, although

the total production for the latter month, as shown in the table, was slightly greater than that of June. This apparent anomaly is accounted for by the fact that there are 31 days in May as compared with 30 in June.

According to the figures just issued by the Bureau of Mines the stock of gasoline on hand on June 30 was 418,440,353 gals., as against a stock of 460,637,479 gals. at the end of May. The total of April 30 was still larger, being 509,197,134 gals. Taking the season and the additional demand into consideration, these stock figures are perfectly normal.

Production of crude oil has dropped slightly, the June figures being 28,140,479, as against 28,510,698 gals. during May. The item "Oils Purchased and Re-run" given above is not a figure which can be properly added to actual crude production figures, as it is understood to represent crude or distillate which has at some previous date been included in the regular crude production figures. Nevertheless, these additional 3,483,270 gals. are available.

The remaining items shown in the tabulation herewith show both production and stock of crude oil and gasoline and the stocks on hand of the derivatives of the former as on the last day of each of the two months.

Production and stocks on hand of crude oil and gasoline for the past year

**George E. Flanders Enlists**

George E. Flanders, son of Walter E. Flanders, president of the Maxwell Motor Co., Inc., Detroit, has enlisted as a private in the United States marines at the age of 18, and is now stationed at Paris Island.

Dr. Clyde Leeper, medical director of the social service work of the Goodyear Tire & Rubber Co., and in charge of the anti-tuberculosis work of the Red Cross, has been appointed one of the physicians who will have charge of Red Cross anti-tuberculosis work in Italy. He is scheduled to sail the latter part of this month.

William H. Armstrong, for eight years holding executive positions in the Mitchell Motors Co., Racine, Wis., and its predecessor, the Mitchell-Lewis Motor Co., has resigned as secretary and treasurer of the company to take the active management of the Armstrong Foundry Co., Racine, the recent re-organization of the Holbrook-Armstrong Iron Co. of that city. Mr. Armstrong has been elected president.

A. W. Voegel of Detroit has been appointed assistant to Maurice Rothschild, general manager of the Regal Motor Car Co., Detroit, who is formulating plans to reorganize the company for the start of manufacturing at close of the war.

J. H. Morrill formerly in charge of the engineering department of the Northway Motors Co., Detroit, has been appointed assistant chief engineer of the Buda Motor Co., Harvey, Ill.

Dr. Orrel A. Parker, manager of the wheel department of the Hydraulic Pressed Steel Co., Cleveland, has been placed in charge of records under W. F. Parrish, chief of the oil and lubrication branch, supply section, in the office of the director of military aeronautics.

**To Regulate Crude Oil Prices**

WASHINGTON, Aug. 20—Prices of gasoline and other oil products will be stabilized, and steady production of petroleum will be assured by a plan now being worked out by the National Petroleum War Service Committee in co-operation with the United States Fuel Administration. Maximum premiums will be arranged for payments for various qualities of oil.

Heretofore competition has caused various refiners to bid against each other and pay excessive premiums over the base rate for oil. This has resulted in exorbitant consumer's prices, and has also created disturbance in the oil industry, frequently hampering oil production.

By means of the maximum premiums it is expected that permanent prices for crude petroleum will prevail and that its proper production and distribution will be assured. Protection will thus be given to both small and large refineries in securing their supplies while at the same time consumers will be insured against excessive prices for gasoline and other oil products.

## Men of the Industry

*Changes in Personnel and  
Position*

**Motor Transportation Under  
Brig.-Gen. Drake**

*(Continued from page 307)*

lery, and in each organization and station, there will be an officer of the Motor Transport Corps or an officer as acting Motor Transport Corps officer, designated Motor Transport Corps officer of that command, who is responsible for the efficient operation of the Motor Transport Corps within the limits of his command. His activities are controlled by G-1 in division or corps, and by G-4 in armies, in the same manner as are those of other representatives of technical and supply services in such commands. The functions of this officer are as follows:

First. He is in command of all motor transportation of the First Class, as defined above, and controls its operation as specified in paragraph 4-(h) above. He is also in command of all Motor Transport Corps maintenance and supply agencies on duty with the command.

Second. He exercises the functions of a staff officer as regards the supply of all Motor Transport Corps property for the command and as regards the technical supervision over motor vehicles of the Second Class provided for in paragraph 5 above.

To carry out this technical supervision, it will be his duty to make frequent inspections of all matters having any bearing on the motor transportation of the command. In making these inspections, he will be afforded every facility by all concerned. He will make frequent reports to the Divisions of the General Staff by whom his activities are controlled, covering such matters as the suitability of the personnel charged with operating motor vehicles, the mechanical condition of the vehicles, the conditions under which they are operated, needs for repair or overhaul, carelessness or waste on the part of any individual organization and similar matters, together with his recommendation as to any action that should be taken.

11—The chief of each department will submit on or before August 31, 1918, a list of funds appropriated for the design, purchase, equipment, repair and maintenance of motor vehicles as defined under paragraph 3 preceding. This last will show unexpended balances. The chief of each department will also submit the amount estimated and desired to be retained for purchase of special designs defined in paragraph 7 preceding. All unexpended balances of above appropriations will be transferred to the Disbursing Officer, Motor Transport Corps.

12—All existing contracts for motor vehicles, motor vehicle equipment and

**Airplane Program Mercilessly  
Criticized**

*(Continued from page 334)*

an experimental field and of the Wilbur Wright flying field at Dayton. The committee states that it feels obliged to note in this connection that shortly before negotiations for the McCook and the Wilbur Wright fields were completed Col. E. A. Deeds, a member of the aircraft board, was the owner of the first and a part owner of the second. He sold and transferred them to interests with which he had been identified. The committee states the number and amount of contracts for planes and engines are assigned to concerns at Dayton and Detroit, and the number and collection of aviation fields at Dayton could not fail to attract the attention of the complete senate committee. Due to the vast automobile industry, Detroit doubtless possesses more facilities for gas engine production than any other American community.

Industrially considered, the concentration of a great number of these two pursuits in these two cities may perhaps be justified but the committee is forced to the conclusion that the personnel of the aviation board from its formation to its reconstruction explains the fact. It recommends a commission of individuals and facilities for observation at the front who will work in relays between America and the front.

The Liberty engine is approved by the committee but is said to be imperfect yet, though rapidly approaching perfection. The committee complains that fighting planes have not been built around the Liberty engine and that our aircraft program will not be complete until one is. Only 2114 airplanes have been delivered to our army in France by our Allies.

The committee points out that the Allies have been hampered in deliveries of these planes because of our inability to supply them with raw materials. Our training planes are said to be excellent, both by the committee and by foreign experts who were called in.

The profits on the Liberty engines by our manufacturers are said to run as high as 34 per cent and on the Liberty engine aluminum pistons as high as 285 per cent on the capital invested. Numerous examples are told of in the report of the placing of contracts and their subsequent withdrawal to show the indecision existing with the original Aircraft Production Board.

supplies, maintaining, operating and repairing motor vehicles, will be taken over by the Chief of the Motor Transport Corps, who will also make all future purchases and disbursements.

(322.02, A. G. O.)

II—Section II, General Orders, No. 38, War Department, 1918, is rescinded.

(322.02, A. G. O.)

By order of the Secretary of War:  
PEYTON C. MARCH,  
General, Chief of Staff.

Official:

H. P. McCain,  
The Adjutant General.

**W. S. S. Societies Formed at Ford Plant**

DETROIT, Aug. 13—More than 700 war saving societies have been formed in the plant of the Ford Motor Co. Between 30,000 and 40,000 employees have agreed to take war savings or thrift stamps every week for a total that will reach the \$2,000,000 mark within a year. The societies were organized at the Highland Park plant and at the blast furnaces in the River Rouge district. It is expected that many more societies will be formed in the Dearborn tractor plant of Henry Ford & Son.

**Olds Given Trailer Contract**

LANSING, MICH., Aug. 16—The Olds Motor Works has received government contracts for 2,100 portable kitchen trailers for aviation service. New equipment is being installed for manufacturing the trailers, and it is expected that actual work of turning out the trailers will be started by Sept. 1 and completed by Jan. 1.

**McCord Expanding Plant**

DETROIT, Aug. 17—The McCord Mfg. Co. is erecting a four-story addition to its plant, three stories to be used for factory purposes and the fourth to be used for offices. The new structure will be approximately 372 by 110, with area of 134,000 sq. ft., which, added to the present plant, will give a total floor area of 319,000 sq. ft.

**Miller Rubber to Expand**

AKRON, Aug. 16—The Miller Tire & Rubber Co. will take on a contract in the near future which will make it necessary to employ 400 or 500 additional men and girls. Officials of the company decline to disclose the nature of the contract, but it is assumed that it is a war order.

**Current News of  
Factories**

*Notes of New Plants—Old  
Ones Enlarged*

**Steel Products Co. Builds Powerhouse**

The Steel Products Co., Cleveland, will build a one-story powerhouse at 2196 Clarkwood Road, Southeast. The structure will be 45 by 70 and will cost approximately \$17,000.

L. W. Coppock has been appointed general engineer and chief in charge of production of the Lane Motor Truck Co., Kalamazoo, Mich., succeeding Harvey M. Stewart, who recently resigned as engineer of the Lane Motor company. Mr. Coppock was actively interested in the organization of the United Truck Co., Grand Rapids, and the Higrade Truck Co., Harper Springs, Mich.

**Avery Co. Absorbs Davis Concern**

MILWAUKEE, Aug. 17—The Davis Mfg. Co., Milwaukee, manufacturer of tractor engines, which recently was purchased by the Avery Co., Peoria, Ill., has lost its identity and from now on the big plant in West Allis will bear the name of the Peoria company exclusively. Frank M. Davis, however, continues as general manager of the unit. The Davis company has been manufacturing engines for Avery tractors and power farm machinery for several years and is now devoted exclusively to that purpose. One of the reasons why the Davis name is dropped is to facilitate operations under war-time conditions.

**Talking Machine Co. Builds Airplane**

PHILADELPHIA, Aug. 16—The first scouting hydro-airplane made from parts manufactured by the Victor Talking Machine Co. of Camden, has had a successful tryout. The plane was piloted by Lieutenant G. H. Pumpelly, who put it through its paces. The test showed the machine is capable of turning in a remarkably small area. Plain and fancy diving were features of the exhibition. The start was made from the Philadelphia Navy Yard at League Island, where the machine was assembled.

**Reliance Co. Obtains Government Contract**

APPLETON, WIS., Aug. 17—The Reliance Motor Truck Co., Appleton, Wis., which has just completed and equipped a new manufacturing plant at a cost of \$75,000 or more, has taken a large Government contract for machine-work on large calibre shells. Additional tools and other machinery for this work will be installed immediately. While the contract is being executed the Reliance company will continue to prepare for a large production of commercial cars and internal spur-gear drive rear axles, for which it already has booked contracts to keep the plant busy for months to come. Plans for an additional shop building are being prepared and work will begin before Sept. 1.

**Cleveland Automatic Tool Enlarges**

CLEVELAND, Aug. 16—The Cleveland Automatic Tool Co. has let contracts for a large addition to its plant at Central Avenue, Southeast and East Sixty-fifth Street. The company recently acquired the land adjoining its plant. The new structure will be two stories and will cost approximately \$100,000.

**BUSINESS CONDITIONS AS REPORTED TO THE FEDERAL RESERVE BOARD**

The following summary of general business conditions on July 23, 1918, is based on reports from the 12 Federal bank districts

District	General Business	Crop Condition	Industries of the District	Construction, Buildings, and Engineering	Foreign Trade	Money Rates	Railroad, Post-office, and Other Receipts	Labor Conditions
No. 1, Boston..... No. 2, New York.....	Active..... Activity limited only by shortage of raw materials.	Good..... Fairly good.....	Busy..... Intensely active on war work.	Small..... Heavy decreases, except on Government work.	Improved..... During fiscal year ending June 30 imports decreased 7 per cent, exports 14 per cent.	Increased..... Firm; ruling rate 6 per cent.	Mixed..... Post office, June returns increase over 1917; telegraph, quarterly returns increase over 1917.	Unsatisfactory..... "Work or fight" order and Federal control of employment of unskilled workers; somewhat relieves shortage.
No. 3, Philadelphia..	Very good.....	Very good.....	Very busy.....	Building at lowest mark for a decade.	Shipment of war supplies continues heavy.	Continue firm.....	Increasing.....	Shortage in all lines.
No. 4, Cleveland.....	Satisfactory.....	Good.....	Active.....	Inactive.....	.....	Very firm.....	Increase.....	Scarce; somewhat unsettled.
No. 5, Richmond.....	Active and profitable.	Unusually favorable.	Running to capacity; limited only by labor and supplies.	Private building negligible; Government housing active.	Restricted by lack of freight room.	Firm; 6 per cent. ....	Railroad, irregular; post office, volume large; reflects increased rates.	Some slight improvement reported.
No. 6, Atlanta.....	Excellent.....	Good.....	Very active.....	Light, except Government work.	Very light.....	Slight increase.....	Slight increase.....	Very unsatisfactory.
No. 7, Chicago.....	Do.....	Very good.....	Generally at capacity.	Stagnant.....	.....	Firm.....	Post office receipts increase.	Insufficient supply.
No. 8, St. Louis.....	Good.....	Favorable.....	Active.....	Quiet.....	.....	Do.....	Decrease in post-office receipts.	More settled.
No. 9, Minneapolis..... No. 10, Kansas City.....	Do..... Do.....	Good..... Do.....	Do..... Do.....	Fair..... Generally restricted to essentials.	.....	Do..... Practically unchanged.	No change.....	Good.
No. 11, Dallas.....	Satisfactory, considering summer season.	Fair.....	Do.....	Below normal.....	Good.....	Unchanged; steady to firm.	Railroad, increase; post office, 52.7 per cent increase.	Unsatisfactory on account of shortage.
No. 12, San Francisco.	Active.....	Good.....	Very active.....	Decreased 29 per cent from last month, but 16 per cent greater than June, 1917.	Large volume.....	Firm.....	Increasing.....	Settled.

## Aircraft Production Purchases

WASHINGTON, Aug. 16—Following is a list of purchases recently contracted for by the Bureau of Aircraft Production:

July 31, 1918

Taft Pierce Manufacturing Co., Woonsocket, R. I., equipment for motor assembly plant.

Jas. Cunningham & Sons Co., Rochester, N. Y., 50 Burton type balloon windlasses.

The Russ Co., Cleveland, Ohio, 9500 carrying chests.

Eastman Kodak Co., Rochester, N. Y., license to the Government under patent No. 733,729 and reissue No. 12,637 for dopes, to make or have made and use the processes and products covered by the above mentioned patents for war purposes and during the period of the war.

Aug. 1, 1918

North Carolina Pine Emergency Bureau, Munsey Building, Washington, D. C., 5600 pieces lumber.

Canadian Aeroplanes (Ltd.), P. O. Box 638, Toronto, Ontario, Canada, spares for Canadian JN4-D planes, alleron fittings.

Curtiss Aeroplane & Motor Corp., Buffalo, N. Y., spares for "V-2," Type 3, engine (470 items).

Aug. 2, 1918

George H. Maus, Amsterdam, N. Y., 60,000 bamboo poles.

The Curtiss Aeroplane & Motor Corp., Buffalo, N. Y., spare parts for 436 JN6-H-T training planes, equipped with forward gun and dual control; engine bed bearers, cowls, elevators, landing gears, rudders, wings, etc.

Thomas Morse Aircraft Corp., Ithaca, N. Y., 150 gunnery airplanes, 84-C, complete.

Packard Piano Co., Fort Wayne, Ind., 1000 combat propellers for US-12 engines.

Hallet & Davis Piano Co., Boston, Mass., 1000 combat propellers for US-12 engines.

Zenith Carburetor Co., Detroit, Mich., 50 sets No. 48 D. C. carburetor and spare parts for Hispano-Suiza, 150-hp., Type A engine.

The Silveco Co., South Bethlehem, Pa., 24,000 spark plugs for use on Hispano-Suiza Type A, 150-hp. engine.

Aug. 3, 1918

Ford Motor Co., Detroit, Mich., spare parts according to "M" and "L" lists for 5000 Liberty engines.

The Simplex Wire & Cable Co., Boston, Mass., 3000 miles field wire.

Eastman Kodak Co., Rochester, N. Y., 50,000 gal. cellulose acetate dope.

Standard Seamless Tube Co., Ambridge, Pa., 70,500 ft. seamless steel tubing.

Bordentown Steel & Tube Co., Bordentown, N. J., 54,500 ft. seamless steel tubing.

B. F. Goodrich Co., Akron, Ohio, 10 supply balloons.

Aug. 15, 1918

W. M. Matthews & Bro., 620 Southern Building, Washington, D. C., 5000 breast reels, without spool.

Wayne Oil Tank & Pump Co., 1337 Meridian Place, Washington, D. C., 93 portable oil tanks.

J. C. Pushee & Sons, Boston, Mass., 20,662 brushes.

Continental Car Co. of America, Louisville, Ky., services in connection with crating 350 machine shop truck bodies.

## Contracts

Standard Aircraft Corp., Elizabeth, N. J., 60,700 ft. seamless steel tubing.

Curtiss Aeroplane & Motor Corp., Buffalo, N. Y., 40 sets wings, upper and lower, right and left, complete.

Unit Construction Co., Fifty-eighth Street and Grays Avenue, Philadelphia, Pa., 2700 air fans for driving 100-watt generator used on radio telephone combination transmitting and receiving set.

Aug. 20, 1918

Standard Aircraft Corporation, Elizabeth, N. J., for services in the erection of 1 British Handley-Page airplane.

Wright-Martin Aircraft Corp., New Brunswick, N. J., services and material in repairing motor returned from United States aerial mail station, Busleton, Pa.

Curtiss Aeroplane & Motor Corp., Buffalo, N. Y., 436 JN6H advance training planes with dual control, and fixed gun only; 34 JN4H advance training planes with dual control, and fixed gun only for the Navy.

Spitdorf Electrical Co., Newark, N. J., 40 sets Dixie D800 magnetos and spare parts to be used in connection with all Hispano-Suiza engines using 1 right-hand and 1 left-hand magneto.

D. Nussbaum & Co., Union Course, L. I., N. Y., 7500 sweaters.

Wright-Martin Aircraft Corp., New Brunswick, N. J., repairs for Hispano-Suiza type A engines—crankshaft and hub assembly, crankcase assembly complete, water pump assembly, Dixie D800 magneto assembly, right-hand cylinder cover, tachometer drive assembly.

Long-Knight Lumber Co., Indianapolis, Ind., 100,000 feet walnut.

British Munition Board, London, England, 125 lenses for airplane cameras.

Wright-Martin Aircraft Corp., New Brunswick, N. J., spare parts for Hispano-Suiza engines—cylinder casting left-hand and right-hand aluminum assemblies, cylinder casting steel sleeve assembly.

Firestone Tire & Rubber Co., Akron, Ohio, 436 outer casings (latest type now in production for Curtiss JN6H advanced training planes).

Unit Construction Co., Philadelphia, Pa., material for 500 sets of laminations for Handley-Page propellers.

Hardman, Peck & Co., New York, N. Y., 1000 sets of laminations for Handley-Page propellers.

C. F. Pease Co., Chicago, Ill., 1125 100-yard rolls X-electric blue print paper.

Lycoming Foundry & Machine Co., Williamsport, Pa., 15 sets tools, complete, for maintenance for Gnome airplane engines, type B2.

## Lamp Co. Declares Dividend

The C. M. Hall Lamp Co. has declared a 6 per cent dividend on \$600,000 of outstanding stock, payable Aug. 22, half in cash and half in Liberty bonds.

## General Engineer Depot Contracts

WASHINGTON, Aug. 16—Following is a list of contracts placed by the General Engineer Depot:

Aug. 9, 1918

Penberthy Injector Co., Detroit, Mich., automatic injectors.

U. S. Rubber Co., New York City, conductor cables.

Aug. 10, 1918

Westinghouse Co., Schenectady, N. Y., grease cups.

General Electric Co., Washington, D. C., spares for motor.

Aug. 13, 1918

Goodyear Tire & Rubber Co., Philadelphia, Pa., belt clamps and rubber belting.

International Motor Co., Washington, D. C., spares for trucks.

## Motor Transport Contracts

WASHINGTON, Aug. 16—Contracts for 5000 AA trucks were placed by the Motor Transport Service as follows:

J. C. Wilson Truck Co., Lexington Motor Co., Velle Motors Corp., Auburn Auto Co., Dort Motor Car Co., Hupp Motor Car Co., Elgin Motor Car Corp., General Motors Truck Co., Standard Motor Truck Co., Saxon Co.

The AA standard army truck is an adaptation of the G. M. C.  $\frac{3}{4}$ -ton truck No. 16, which replaced the original AA model.

## Developing Standard Compass Tests

WASHINGTON, Aug. 19—The Bureau of Standards is making an investigation of magnetic compasses. The Bureau will develop a standard method of testing compasses and will prepare specifications for their purchase by the Government. A special form of magneto-meter has been devised to determine the magnetic movement and rotation test for pivot friction. It is expected that several thousand compasses will be tested in the course of the present year.

## Ford Motor Co. Files Suit

MILWAUKEE, Aug. 17—The Ford Motor Co. has filed suit in the circuit court at Milwaukee against the Lippow Cycle Co., 704 North Avenue, to force it to remove a sign announcing the sale of Ford accessories and supplies. The Ford company claims the Lippow company is using the Ford trade mark illegally.

## Calendar

## ENGINEERING

Sept. 2—Cripple Creek, Colo. American Institute of Mining Engineers.

Nov. 14-15—New York. Society of Naval Architects and Marine Engineers. Twenty-sixth general meeting. Engineering Societies Bldg., 29 West 39th Street.

## ASSOCIATIONS

Oct. 7-12—Milwaukee. American Foundrymen's Assn. and 5 allied organizations. Milwaukee Auditorium.

## SHOWS

Aug. 19-24—Erie, Pa. Tractor demonstration (Exposition Grounds).

Aug. 20—North Rose, Wayne Co. Tractor demonstration. State Food Commission. Calvin J. Huson, Director.

Aug. 24—Herkimer, N. Y. Tractor demonstration (Field Day). Chas. A. Taylor in charge.

Aug. 28—Gates Center, Monroe Co. Tractor demonstration (State Fair) Food Commission. Calvin J. Huson, Director.

Aug. 28—Concord, N. H. Tractor demonstration (County Farm Bureaus). M. C. Wilson, Director, Agriculture Extension, Dunham, N. H.

Aug. 29—Laconia, N. H. Tractor demonstration (County Farm Bureaus). M. C. Wilson, Director, Agriculture Extension, Dunham, N. H.

Aug. 28-30—West Raleigh, N. C. Tractor demonstration (Farmers' Convention, College Farm). Dr. R. Y. Winters in charge.

Aug. 30—Campton, N. H. Tractor demonstration (Albion Farms). H. G. Gulliver, Mgr.

Aug. 30—Cheshire, Conn. Tractor demonstration (New Haven County Farm). Mr. Harvey, Mgr.

Sept. 2-6—Hartford, Conn. Tractor demonstration (State Fair). Will F. Landon, Sec.

Sept. 2-7—Indianapolis, Indiana. State Fair. Indianapolis Automobile Trade Assn.

Sept. 5—Medina, Orleans Co. Tractor demonstration (State Fair) Food Commission. Calvin J. Huson, Director.

Sept. 9-14—Milwaukee. Milwaukee Automobile Dealers, Inc. Fourth Annual Wisconsin State Fair. Hart J. Ruddle, Mgr.

Sept. 9-14—Syracuse, N. Y. Tractor demonstration (State Fair). J. Dan Ackerman, Secy.

Sept. 17-20—Riverhead, L. I. Tractor demonstration (County Fair). Harry Lee, Sec.

Sept. 30-Oct. 4—Trenton, N. J. Tractor demonstration (Trenton Fair). Harry B. Salter, Supt.

## RACING

Sept. 2—Uniontown. Uniontown Speedway Assn.

Sept. 7—Chicago. Chicago Speedway.

Sept. 21—Sheepshead Bay.

Oct. 5—Cincinnati. Cincinnati Speedway.

### Dependable Spark Plugs

## Big Increase in Porcelain Efficiency

*Half Again as Much Resistance to Current When Heated*

In the high-speed, high-compression motors of to-day spark plugs must work in heat undreamed of a short time ago.

Yet under intense heat the porcelain insulator that once worked perfectly actually becomes a conductor of the electric current—fails to supply the explosive spark.

But science has now more than kept pace.

Experiment 3450 in the tenth year of unremitting original research work in our porcelain laboratories has produced a porcelain with half again as much resistance to current when heated.

Champion Dependability takes so long a step forward that it seems well

nigh inconceivable that any future motor will ever again develop heat enough to threaten short-circuiting through the porcelain insulator.

Dealers have always found it to their advantage to sell Champion Spark Plugs. Now more than ever their greater dependability means increased business. Sell them.

**Champion Spark Plug Company, Toledo, Ohio**

## Proper Spring Lubrication means Comfort over Rough Riding—

Is your car a rough rider? Do you know that you can improve its riding qualities from 50% to 100% with proper spring lubrication? The easiest and cheapest way to lubricate springs is with Johnson's Stop-Squeak Oil. You don't need a tool of any kind—it isn't even necessary to jack up your car. Just squirt Johnson's Stop-Squeak Oil on with an oil can or paint it on with a brush.

# JOHNSON'S STOP-SQUEAK OIL

Johnson's Stop-Squeak Oil is a remarkable penetrator. It will immediately seep between the spring leaves driving the dirt and rust before it and leaving a thin layer of lubricant between.

### *Takes Out Every Squeak*

Johnson's Stop-Squeak Oil is unexcelled for removing squeaks of all kinds—in springs, shackle bolts, body, fenders, top, etc. Just locate the squeak and touch with Johnson's Stop-Squeak Oil.

Quarts.....\$ .85	Pints.....\$ .50
Half-Pints.....\$ .35	

Write for our booklet on "Keeping Your Car Young."  
We will gladly send it free and postpaid. It will tell  
you how to reduce automobile depreciation.

## **Airplane Delays Due to Lack of Co-operation and Experience**

**Appointment of Ryan as Second Assistant Secretary  
of War Step in Right Direction**

**ARMY ORDERS FROM FRANCE CAUSED CHANGES**

**Engine and Plane Program Frequently Altered—Multitude  
of Manufacturing Reasons for Delay**

**By David Beecroft**

**N**EW YORK CITY, Aug. 28—Specific blame for the unfortunate failure of our aircraft program cannot be laid to any one individual. The blame can justly be spread not only over the entire civilian personnel connected with the problem, but also over the army and navy departments connected with it. The blame rests not only on these parties in America but partly must rest on those connected with this work in Europe.

This is the only conclusion that can be arrived at after studying the concise, yet fairly voluminous report of the sub-committee of the Committee on Military Affairs which spent months visiting the different aircraft factories and interviewing persons of all caliber connected with the airplane program. This committee also visited the testing fields and carried on other lines of investigation with the possible exception of investigating charges of personal dishonesty, or official corruption, which investigation is being carried on by Charles E. Hughes.

The report of the sub-committee is perhaps as complete as could be expected, as the committee

realizes the volume of the work before it. While the report is a pretty general denunciation of the complete airplane program, the humanness of the committee crops out when it declares that "your committee realizes that it is easier to criticise than to construct, and that due allowance should be made for mistakes of judgment, which are unavoidable in the organization of a new branch of the service, involving the establishment of an extensive industry. Our inquiry has been as impersonal as these conditions have permitted, and it is in the same spirit that this report is made."

The only possible deduction after studying the report and taking cursory glances at the 1226 pages of evidence obtained in questioning over 110 individuals connected with the aircraft work is that so long as it is human to err, scores, in fact hundreds, of the charges in the report must be ascribed to this human limitation. There is no thought in this of attempting to whitewash any individual in anywise connected with the design or production of airplanes. This statement is made because of the fact

that the delays in aircraft production were very largely because the airplane program, which we had to face after our declaration of war, had to be evolved under strenuous conditions.

It was a new and very highly technical industry in which our country had had a negligible experience. While as a people we had built some planes for peace purposes, we had never built a single combat machine; even our planes which were used in the Mexican campaign were for ordinary purposes and not for combat, so that our experiences in that episode counted for nothing so far as our airplane program is concerned.

It is impossible to agree with the tenor of the report which places practically all of the blame on the automobile industry and the evidence given does not bear out this exclusive condemnation. It is true that the automobile industry was not familiar with many of the problems connected with aviation, particularly that of plane design and construction. On the other hand, there was no group of manufacturers in America familiar with this work excepting small firms that had never had any experience in combat plane design or production.

The automobile industry has taken hold of the development of the Liberty engine and from the general approval of this type of engine, which is now less than 14 months old, and from the great orders which had been placed for it by the Allies, those criticisms by the committee of the industry become not only unmerited and unjust, but lead to the sole conclusion that the work of the committee seems to have been confined too much to the smaller concerns who have felt slighted in this Liberty engine program and who were slighted because of the lack of production capacity and of any organization to take hold of the work.

No stronger commendation of the work the automobile industry has done could be asked than the fact that the number of Liberty engines ordered has been increased from 22,500 to 50,000 and it is probable that orders will soon go as high as 68,000 engines for the next 12 months.

Further commendation of the same policy of the automobile industry in the question of engine design is the corroboration of the Liberty engine program by announcing that the eight-cylinder Liberty, which was originally developed in June and July, 1917, and set aside by army orders later, is now being taken up and will unquestionably fill an important place in our aviation engine program. It is impossible to understand why the Senate Committee should possibly lay the entire blame of the aviation program on an industry that has accomplished so much.

The British War Cabinet report in its chapter on aviation, published in *AUTOMOTIVE INDUSTRIES* some months ago, declared that it requires 12 months from the conception of the design of an aircraft engine until it is in production, and approximately 6 months for the development of a plane through the same stages. The American automobile industry far exceeded this estimate of a country which has been in war 4 years and has learned many lessons in

aviation engine design and construction because in less than 1 year the program of the Liberty engine for eight and twelve-cylinder designs was conceived, the eight-cylinder design was developed and then set aside, and the twelve-cylinder developed and put into production, so that over 4000 engines have been delivered.

With these as actual facts, the censure of the committee cannot be accepted as just and can only be interpreted as being biased due to the evidence of some who have not been as much in sympathy with the program as they should have been. To the critical reader the complete value of the report is lost in view of the failures of criticism to coincide with facts.

Had the report commented reasonably upon the difficulties connected with the development of production as the evidence indicates, we would have agreed that the deductions in the report were in accordance with the evidence at the hearings. On the other hand, the denunciations of the automobile industry are not even modified, but given the complete atmosphere of sole responsibility, in short the industry is blamed for everything, even the hundreds of things over which it had not the slightest control.

It was the human inability to grasp the magnitude of the aircraft program in June, 1917, that practically set the stage for the avalanche of criticism that has been heaped upon everyone connected with aircraft work since January, 1918, when it began to be made known that the program was anywhere from 3 months to 6 months behind schedule.

The real trouble started when those connected with aircraft made the announcement to the newspapers of the country at a dinner in New York City in May, 1917, that the confidential program would be to build perhaps 10,000 planes in the next year. Some of the daily press, not satisfied with 10,000 planes, swelled the number to 50,000, and in May, June and July of 1917 the country was more or less educated to the belief that it was within the range of possibility for America with its world reputation for production to put on the battlefields of Europe during 1918 as many as 100,000 airplanes of all denominations.

Unfortunately, the seed of American possibility of supremacy was scattered broadcast. The thousands of highways through the air to Berlin were accepted as a possibility by millions of our people.

Those in charge were but human beings of the same physical stature as of April 5, before we entered the war. It is true our entry into the war worked a great mental change, but it was impossible to carry out the visions of many who created the picture. *In a word, the aircraft personnel oversold itself.*

That the report, which is published in full in this issue, is certain to accomplish much good is shown by the appointment of John D. Ryan as Second Assistant Secretary of War, with complete responsibility for the army air service, which appointment is but one step upward in the certain program of having a cabinet officer in complete charge of the air service of the army and navy.

Mr. Ryan's appointment as Second Assistant Secretary of War means that the dual control which the government created on May 20 of this year, when Mr. Ryan was given direction of the Bureau of Aircraft Production and Major-General William M. Kenly was given charge of the Bureau of Military Aeronautics, comes to an end. This in itself is an acknowledgment of the humanity of our government, which failed to realize the stupendous problems of aircraft, and to-day realizes as a result of the present report that many of the delays have been due to incorrect organization, which can scarcely be laid upon the shoulders of the personnel carrying on the work under the specified organization. The end of this reorganization by Congress has not yet been reached, because to-day the army and navy aircraft program has not been centered in one man as it is certain to be.

Let us look at this human characteristic to err in perhaps a broader light: It is the easiest thing for our 80,000,000 people who have reached the age of manhood and womanhood to criticize the aircraft personnel for not doing exactly what England, France and Italy did in the manufacture of engines, airplanes, airplane equipment, and in all other matters relating to aircraft.

### Why a British Air Service?

These criticisms may be just, but if we are to continue our criticisms we might ask, Why did not Congress duplicate, identically the legislative organization of England, France or Italy? Why did we not create last year an air service? We can go further and ask: Why did not Great Britain create an air service in 1914 immediately after the declaration of war instead of having to wait until 1917?

There is but one answer, namely, that everybody connected with the air program in Great Britain is human, subject to error, and the same applies to everybody in America whether connected with the army, the navy, the government, or the civilian personnel of aircraft work.

From the hearing before the sub-committee of the Committee on Military Affairs, United States Senate, various reasons for delays in connection with the broad airplane program crop out in different parts of the hearings and the one conclusion is that these delays are so widely spread and cover so many different fields that the blame can only be laid to the enormity of the work, the highly technical

**John D. Ryan**

*Who has been appointed Second Assistant Secretary of War with complete charge of the Army air service*

were in total ignorance up to the time we declared war.

We had never built a machine for combat purposes and one that was intended to carry a machine gun, and it is not surprising that many delays were caused by this. Bombing devices had to be developed. The photographic task alone was a huge one. There was the development of all kinds of instruments for measuring speed, altitude, etc.

Previous to entering the war, our airplane engine production for the Allies was confined to building for training planes and we were in production on the 100 hp. Gnome and the 150 hp. Hispano-Suiza engine. One company had spent, according to its own admission, \$10,000,000 in practically 2 years in adapting the manufacture of Hispano-Suiza engines to meet American factory conditions and American workmen.

### Lack of Skilled Mechanics

The lack of sufficiently skilled mechanics familiar with the manufacture of instruments and capable of interpreting and producing delicate instruments required for combat planes is but one example of the cause of delay in this line.

There was a great lack of engineering ability for the design and production of combat planes none of which had ever been built in America. Previous to the declaration of war the government had not demanded the development of production of a single combat plane. Under such conditions it is not surprising that under the strenuous atmosphere of April, May and June, 1917, this lack of experience should result in failure properly to map out a complete air program.

character of the parts entering into it, and the general lack of experience on the part of all those connected with the work.

In this connection the reader must keep in mind the broad problem of aviation instead of centering perhaps his attention on the Liberty engine, which in publicity in the last year has been looked upon as the apex of our aviation program.

The engine is only a small part of the task. There are four to six quite different types of planes required for combat work and each of these is a huge problem in itself. There is then the adapting of an engine suitable for these. There is the development of a huge line of aircraft equipment embracing over thirty different kinds of apparatus with practically all of which we

Col. Robert L. Montgomery

Howard E. Coffin

Admiral D. W. Taylor

In order to cope with the aircraft requirements the Aircraft Production Board, which was created in May, 1917, almost immediately sent a mission of army and navy officers and civilians to Europe to investigate aircraft methods in England, France and Italy, and to recommend types of engines, planes and accessories necessary for the work and to have samples of these planes, engines, instruments, accessories, and all necessary drawings, together with bills of materials, specifications and other necessities to this country in order to facilitate production.

Perhaps the great delay in the production of combat planes started at this time because samples of the planes recommended by this mission for manufacture here were not received in the United States until after September. When these samples arrived they were without engines with the exception of the Spad and many of the blueprints which accompanied them were inadequate for development according to American methods of quantity production.

### Training Planes Speeded Up

These were five precious months in the aircraft program work and they were made use of by the Aircraft Production Board in speeding up the building of training planes and engines so as to meet our training requirements. The 3000 miles which separated the United States from the fighting front must always be considered as one of the reasons for serious delays.

There should have been organized in 1917 a weekly service between the technical departments of Europe, England, Italy and the United States. There should have been more of our engineers for engines and planes close behind the fighting front in France, so as to bring to America through our own channels correct recommendations regarding different types of machines.

The manufacture of accessories for combat planes is scarcely comprehended by any excepting a few directly connected with the work. These were the cause of serious delays. Other delays were due to the Ordnance and instrument equipment that was to go on these combat planes and this equipment was

not determined until December, 1917, or 8 months after the declaration of war.

Even the settlement of this equipment was not final and as late as January, 1918, the American Expeditionary Force ordered changes in this equipment and it was the middle of February before the Engineering Department of the Aircraft Production Board had these changes in its hands.

Some of these involved the mounting of two machine guns instead of one to fire through the propeller of the DeHaviland-4 plane, which, changed as late as February, 1918, called for a redesign of the fuselage cowl and arrangement of connections between the engine and various instruments.

### Liberty Engine Design Changed

There were other causes of delay which relate more directly to the engine program. When plans were originally laid down for the Liberty engine on June 4, 1917, it was to be an eight-cylinder design, the first sample of which was running at the Bureau of Standards in Washington July 25.

Nearly a month later, or in August, 1917, cable advices from the Bolling Mission in Europe indicated that the development of aircraft was moving so rapidly on the battle front in France that the eight-cylinder engine would be obsolete before it could get into actual use and the Mission recommended a twelve-cylinder Liberty engine instead.

Immediately, the engineering organization of the Aircraft Production Board took up the development of a twelve-cylinder engine and it was entirely due to the fact that when the Liberty engine was conceived in June that it was to be so standardized that a majority of the parts could be used in four-cylinder, six-cylinder, eight-cylinder and twelve-cylinder design, that the development of the twelve-cylinder, which was begun in August, was able to proceed.

There were then delays that came because of the development of the twelve-cylinder engine. Originally it was intended with 5 x 7 in. cylinders to develop 330 hp., but this was soon increased to 400 hp. by virtue of improvement in the cams, intake manifolds and carburetion.

As this increase of horsepower continued, many of the original parts, such as connecting rods, bearings, etc., became too weak for the increased power, which called for a redesign of these parts to give increased strength. The redesigning of the connecting rod, in order to give increased bearing surface, called for a complete change in the dimensions of the rods which required the manufacture of new dies, tools and fixtures, which caused a serious delay in production. This delay was accentuated due to the great shortage of tool makers and die makers throughout the country.

The difficulties some of the manufacturers experienced in getting dies and fixtures constitute another chapter in the aircraft delay and one which cannot be laid at the door of any manufacturer.

### 165 Jigs and Fixtures Changed
